MINUTES OF EVIDENCE

1

TAKEN BEFORE THE

ROYAL COMMISSION ON THE
PRIVATE MANUFACTURE OF
AND TRADING IN ARMS

FIRST DAY

WEDNESDAY, 1ST MAY, 1935

WITNESSES—

ON BEHALF OF THE LEAGUE OF NATIONS UNION:—
The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.,
Miss K. D. COURTNEY,
Colonel DAVID CARNEGIE, C.B.E., J.P.,
Mr. H. S. SYRETT, C.B.E.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE
TAKEN BEFORE THE
ROYAL COMMISSION ON THE PRIVATE
MANUFACTURE OF AND TRADING IN ARMS

FIRST DAY

Wednesday, 1st May, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Sir KENNETH LEE, LL.D.

Dame RACHEL E. CROWDY, D.B.E., LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Sir THOMAS ALLEN.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Chairman: Before asking Lord Cecil to give his views, which he has kindly come here to do, there are one or two matters that I want to mention which deal mainly with procedure.

The first thing I want to say is this: Without explanation it may seem that possibly an undue length of time has elapsed between the date when we were appointed and to-day, our first sitting. The explanation is this, that all the members of the Commission were not in this country until the 5th April, and to-day is the first day upon which any of those whom we have already invited to give evidence has been prepared to come and lay that evidence before us.

The second thing I want to say is this: All our meetings to take evidence will as far as possible be held in public.

The third thing I wish to say is this,—it has reference to the appearance of counsel: It is, I think, well established that counsel have no right of audience before a Royal Commission such as this; they only appear, if at all, by leave of the Commission and take such part in the proceedings as the Commission authorise. Any application to appear by counsel must be made to the Secretary, who will bring the application before the Commission, and the Secretary will convey the decision of the Commission to the applicant.

There is another matter upon which I would also desire to announce the decision of the Commission. In some of the statements of evidence which it is

intended to lay before the Commission it appears that the witness proposes to give the names of persons or companies as having been guilty of conduct deserving of censure in connection with the manufacture of and trading in arms, without attempting to give evidence in support of the allegation. The Commission intend to deal with this question as follows, namely: In the case of firms and individuals resident and carrying on business abroad, and of transactions taking place wholly abroad, it is clearly not practicable for the Commission to carry out any satisfactory investigation of allegations that may be made. The Commission, however, will not decline to allow witnesses to cite, in support of an argument, cases in this category which have been the subject of public allegation or report. The Commission must, however, exercise their own judgment as to the importance to be attached to such allegations. In the case of allegations against a firm or individual resident and carrying on business in this country, and where, therefore, the Commission is in a position to inquire into the matter, and the firm or individual can give any explanation of the circumstances which they desire to give, the Commission is prepared to receive particulars of any such allegations and will inquire into them if they consider them relevant to their Inquiry. This ruling does not, of course, limit or affect the general inquiry which the Commission propose to make into the question of the manufacture of and trade in arms.

The Right Honourable Viscount CECIL OF CHELWOOD, P.C., representing the League of Nations Union, called and examined.

1. *Chairman:* Lord Cecil, you have been good enough to come and give your views to us, and I understand that you prefer to give them in your own way rather than by way of question and answer?—I am entirely in the hands of the Commission. I thought that perhaps it would save your time if I made a general statement first, and then, of course, any member of the Commission can ask me any questions they desire.

2. Yes, that will be convenient.—In the first place I want to make quite clear what is my position. I come here primarily to represent the League of Nations Union. You have had a statement* handed in by the League of Nations Union as to the attitude of the Union on these matters. That is the expression of the views of the Executive Committee of the Union as a whole, and I think I may say that the whole of the hundreds of thousands of members of the Union would be broadly in agree-

ment with it. I propose in the observations that I am going to make to the Commission, if they will allow me to do so, to state my view of the case, and if it differs from the printed document that has been handed in, then the Commission must understand that I am not pledging the Union as far as those observations are concerned: I am only pledging myself.

As I see it, the general case rests largely upon public opinion in this matter. The Commission will have had in the printed statement the observations made by Lord Halifax recently, and I am going, if I may, to read them again, because they do seem to me to state with very great accuracy the general view which is held in this country on this subject, as far as I have been able to ascertain it. Lord Halifax said:

" . . . this is one of the questions that arouse a very sincere and very profound feeling in the minds of our people. . . . Rightly or wrongly, . . . the great majority of them . . .

* See Appendix, pp. 28-32.

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

conceive this question of the private manufacture of and trade in arms to be directly connected with the great issues of peace and war, on which they feel more deeply and vehemently than upon anything else; and, therefore, regarding war, as they do, as the greatest evil to which the nation can be exposed, and regarding it indeed as only justifiable in cases of ultimate and extreme national necessity, they are . . . disposed to regard the preparation of the implements of war as too high and too grave a thing to be entrusted to any hands less responsible than those of the State itself, fearing any intrusion into so dangerous a field of any interests less imperative than national security and national necessity.*

I believe that to be an accurate statement of public opinion on this matter and in support of that view I may, perhaps, point out that the League of Nations Union—which, of course, has given a very great deal of attention to it—resolved, as early as December, 1933:

“That it is contrary to the public interest that the manufacture and sale of armaments should be carried on for private profit.”

That is their view, and recently the Union, in common with a number of other Societies, has been holding, as no doubt the Commission is aware, what is called a Ballot; that is to say, a vote by a very large number of people. The actual question submitted was: “Should the manufacture and sale of armaments for private profit be prohibited by international agreement?” and on that question up till yesterday—the Ballot is still going on and will not be absolutely completed for a few more weeks, because there are some parts of the country which have been a little later than we expected—practically 7,000,000 votes were given—6,964,000 in fact—and of those approximately 6,500,000 were affirmative and 490,000 were negative. So that there was a vote of about 93 per cent. in favour of the view that the manufacture and sale of armaments for private profit ought to be prohibited by international agreement. I think that probably more information on that point could be given; but that is all that I desire to say about it.

Now as to foreign opinion: The most striking expression of that, I think, was contained in the statement made by a great demonstration of ex-soldiers representing the two great continental associations of ex-soldiers, what are called the C.I.M.A.C. and the F.I.D.A.C. I need not trouble the Commission with the translation of those initials. They do represent a very large body—I believe as many as 8,000,000 members—and they attended at Geneva to represent their views to the Disarmament Conference. Five thousand attended the demonstration and 700 of them waited by deputation upon the President of the Disarmament Conference and presented, among other things, a resolution stating that:

“The ex-service men and war victims, speaking in the name of the above two organisations, which comprise 8,000,000 members, have adopted the following resolutions,”

and this was one of them:

“Material disarmament should include the suppression of private manufacture of, and private traffic in, arms, together with effective mutual international control.”

That was the expression of their view, and on two occasions the International Federation of the Associations for the League of Nations have passed resolutions in the same sense—one in June, 1933, which perhaps I ought to read. I need not read the whole of it; the substance of it is that private armament firms should not be permitted to manufacture or to retain stocks unless they have received

orders from governments and have been authorised to execute these orders by a single official organisation established by the State for the purpose of controlling the production, sale and export of arms, and that such orders should be made public under the authority of the Permanent Disarmament Commission. In 1934, the following year, they passed a shorter and, I think, clearer resolution. The meeting was held at Folkestone, and there were present representatives of some 20 countries. The list contained practically all the important countries—Austria, Belgium, China, Czecho-Slovakia, Denmark, Estonia, France, Germany, Great Britain, Greece, Hungary, Italy, Japan, the Netherlands, Poland, Roumania, Switzerland and the United States of America. The resolution was:

“The whole Federation is agreed that the manufacture and sale of armaments for private profit is a great evil and ought to be suppressed. Many delegations believe that the only way of doing this effectively is by the complete suppression of manufacture and traffic in armaments by private enterprise; others reserve their opinion on this point, without diminishing their adherence to the main principle above stated.”

I ought, perhaps, to explain that these Associations in foreign countries are, some of them, run on the same lines as ours, that is to say they are purely private organisations, but a good many of them have a more or less semi-official status; that is to say, the State provides part of the funds on which they work, and they do feel bound at any rate not to transgress the general views of the governments of their countries. I might add to that—though it is, perhaps, of less importance because it was a minority decision of what is called the Temporary Mixed Commission, the Committee of the League of Nations which dealt with these subjects before the Disarmament Conference—that there was as early as 1924 an opinion expressed that there ought to be prohibition of private manufacture, but it was only adhered to by the French, the Dutch, the Swedish, and, I think, the Polish representatives.

To my mind the most important fact about this matter is that when it came to be considered at the Disarmament Conference, representing, as you are aware, some 60 countries, there was no question at all—as far as I have been able to read the proceedings of that Conference, but Miss Courtney, who is here, will be able to tell you better than I can exactly what happened—in the mind of any single representative, that the present system ought not to be allowed to continue. There was a difference of opinion as to whether the remedy should be by State control of existing armament manufacturers or by the actual purchase and taking over of armament manufacture, but I do not gather that there was any dispute that one or other of those two remedies ought to be adopted. I venture to submit that that is rather an important matter for the Commission to consider, because it looks as if the Commission will have to consider first, not whether anything should be done, but which of those two remedies should be adopted. Of course, they are quite free to say they do not agree, but it is to my mind an important matter.

That is, as I understand it, the general public opinion of the world on this subject. Though I have no doubt other facts could be brought to your notice, I think they would confirm that general view. I should just like to add that this is not a small matter. We are dealing with very important and powerful interests. That, of course, cuts both ways. There is no doubt at all that the armaments industry is a very important one, exercising a great deal of influence in a number of countries throughout the world. Taking our own case, the great organisation of Vickers, in one of the documents set out in

* House of Lords: Official Report, 27th March, 1935, Cols. 987-8.

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

the Annex to the League of Nations Union Statement, Note C, Document 11, you will find a statement of royalties received by an American company from Vickers, Limited, and firms licensed by Vickers, Limited, and among them is the Mitsubishi, a big firm in Japan, there is the Vickers firm in Holland, and another one in Holland called the de Schelde, the Vickers firm in Australia, a firm in Spain and probably in other countries. In addition to that I was looking at a book which has been published on this subject. I cannot pretend to have verified the statements; but you will find at pages 80-81 of this book, which is called "Merchants of Death", a little diagram. I only cite it because it is a convenient way of stating the point that I am trying to make. That diagram shows the various connections of this great firm. Apart from that, of course, there are very great firms on the continent, the greatest of them being Schneider-Creusot, and Krupp, in Germany, and a number of American firms. You will find that these firms and Vickers and others have a number of international agreements with one another affecting, not the whole, but part of their trade, regulating prices—I am not making any criticism of it, this is merely to show the extent of the organisation—and districting areas for the purpose of sales, zoning I believe is the term commonly used. You will find these firms set out in various documents cited in that Note C which I mentioned, if you care to refer to it, but as far as I am concerned I am prepared to assert that those documents show quite conclusively the immense extent of this organisation all over Europe and America.

It is not only connection with one another which is important. The actual organisations, very properly from their point of view—I make no criticism at all—naturally get on to their boards the most influential people that they can find—in many cases, in this country, ex-officers with special knowledge of the matter, and in foreign countries, bankers and so on; in fact, anybody who is likely to be of service to them in recommending their trade. I do not know whether the Commission would think it worth while examining that. I am afraid I cannot help them any further, except by just indicating that that is so.

In addition to this, they have very great connections with the Press. I have no evidence that there is any direct connection between those firms and the Press in this country—there may be or there may not be; I do not know—but abroad there certainly is. As the Commission is probably aware, two or three years ago the great steel interests in France, who are, of course, very largely concerned with armaments, bought up two of the best-known Paris papers, the *Journal des Debats* and the *Temps*, and after that transfer the policy of those papers changed, particularly, I believe, in the case of the *Journal des Debats*, which up to that time had been a great supporter of M. Briand. The policy of understanding became a policy of national armaments, and things of that kind. I believe that to a very large extent that has been true of the *Temps* also. You will not, of course, forget that certainly in the old days—I do not suppose it is true now—Krupp assisted or controlled at least three newspapers in Germany. I forget the names of them but they are set out in a variety of these books if you care to investigate them. I remember very well a speech of M. Briand, which he delivered to some women's organisations on this question—a very outspoken speech, which got him into a good deal of trouble, I believe, but his position at that time in France was so overwhelmingly strong that it did not much matter what anybody said about him. He used this strong phrase, which has been often quoted:

"Articles against peace are written with pens made of the same steel as cannon and shells."

I do not want to stress this aspect of the case too much but I think it is conceivable that M. Briand had in mind not only the question of the direct

acquisition of the papers in France and elsewhere, but also the immense influence which great industrial organisations necessarily have—I will not say in altering, certainly that would not be true in this country—in modifying the expression of opinion on any particular question, in view of the great advertisement revenue which they control. And, of course, that becomes more true by reason of the fact that many of these armament firms deal—as has been pointed out by the British Government—with a great number of other things besides armaments. It may have been that which M. Briand had in his mind, or it may have been other circumstances attaching to the Paris Press, which are probably well known but with which I do not desire to deal any further. This difficulty was felt particularly by the continental members of the Temporary Mixed Commission as early as 1924. In the Convention that they drew up regulating the traffic in arms they proposed to put in certain provisions precluding armament firms from having any connection with the Press. On Pages 41-2 of this book—"Documents on the Traffic in Arms" published by the League of Nations Union—you will find that this was the proposal:

"The holder of a licence"—

that is, an armament dealer—

"must not be in a position to influence a newspaper, either by owning a sufficient proportion of its capital or by holding any post whatever in its offices. This measure shall apply equally to all directors, managers and high officials of the firm holding the licence. The holder of a licence must agree not to carry on propaganda of any kind relating to the war material for which a licence has been granted."

I believe I was a member of that Commission, but personally I was never very much in favour of that proposal, because I thought it could be evaded with the greatest ease by anybody who wished to evade it, by holding a share or interest in the name of somebody else. But it shows that even at that time there was a very great feeling in the matter. I mention these things, not with the view to making any particular attack on the armament firms, but to showing the immense strength of this organisation and the great power that it can use, if it desires to use it, for the forwarding of what it regards as its business interest.

I think it is the recognition of that state of things which has produced the very striking feeling to which Lord Halifax alluded. I venture to think that that feeling is based partly, no doubt, on a kind of emotional motive. There is in many people's minds—I confess I am one of them—a feeling that there is something exceedingly shocking in the idea that money is going to be made out of the sale of these instruments, the purpose of which is to cause the death or wounding of fellow creatures. I know it is said, and said with great truth, that if that is not done by private firms it will have to be done, more or less to the extent to which the countries ultimately agree upon it, by the governments of those countries. At the same time there does seem rather a difference between the conception that these weapons should be manufactured by or under the control of responsible governments for great public purposes and mainly for the defence of the country against invasion, and the conception that it should be a matter of bargain and sale and that the more armaments are sold the greater will be the profits of the industry.

That seems to many of us a very horrible state of things and, of course, it necessarily leads to conditions where you find armaments provided by some firms being used on both sides in a war. One instance that is often quoted was in the Boer War, when the Boers used very largely a gun which came to be known as the "pom-pom," a gun which,

1st May, 1935.]

The Right Hon. Viscount CROFT OF CHELWOOD, P.C.

[Continued.]

I understand, was one of Vickers' manufacture, which no doubt was sold to the Boers in time of peace; but, I imagine, not very long before the war, because it was a new gun at that time. Of course many other weapons made by Vickers were used by the British Government. It seems to many people a very repulsive condition produced by this particular industry, without making any charge or attack on the individuals who are carrying it on.

A very recent example of that has occurred in the Chaco War between Bolivia and Paraguay, in South America. The finding of the Commission appointed by the League of Nations in 1934, which examined the question with a view to trying to find some settlement, contained this statement:—

"The armies engaged are using up-to-date material; aeroplanes, armoured cars, flame projectors, quick-firing guns, machine-guns and automatic rifles; the automatic weapons are available in great quantities, but the other arms are few. The arms and material of every kind are not manufactured locally, but are supplied to the belligerents by American and European countries."

Under the existing conditions of neutrality, that must have been by private firms and was, in fact, by private firms.

That is the emotional aspect of it. I hope the Commission will not regard it as a matter to be put aside, because it is that motive which, though not exclusively, is perhaps more responsible than any other for the very strong feeling that exists in this country. It is not only an emotional view. I think that in point of fact it is wrong in principle in a matter of this kind that great financial interests should exist in a country, which must be dependent on war and preparations for war, and that they should be in that matter probably—I would almost say usually—inconsistent with the general policy of the country itself, since the general policy, certainly of our country and, I believe, of almost all countries, is a policy of peace. I cannot help thinking that that is wrong in principle and that it produces bad effects. Taking it on the two sides, internationally and nationally, I do not think it is really open to doubt, that wherever you get tension in international affairs the value of the shares of armament firms goes up. That is inevitable. The demand becomes greater and the price rises. I have a quotation here from *The Manchester Guardian* of the 18th March last, just after the German announcement of conscription. It says:—

"The reaction of the Berlin Stock Exchange to-day to the conscription law was friendly and the heavy industries and others affected by armaments showed substantial appreciation in share values in a number of cases. In United Steel Works shares there was a rise of 2½ points and a turnover of 1,500,000 marks. A heavy business developed in shares of the Berlin Karlsruhe Company (known otherwise as the German Arms Works), which rose 7½ points, when business in them was suspended. For orders of over 2,000 marks in these shares only 50 per cent. of the demand could be fulfilled. The same day it was reported that the London Stock Exchange in gilt edge securities was adversely affected, and also the Paris Bourse."

I think that is a good instance of the conflict that must take place in these cases between the two interests. You will find a good many facts which confirm that view set out in Note B of the Annex to the League of Nations Union statement. I particularly draw the Commission's attention to the movement in the prices of aircraft shares, at the bottom of the third page. Indirectly that is confirmed by the great increase of export of the same class of goods and in armaments generally during the years 1933 and 1934. I think it is obvious that that must

be so. Obviously also it follows that reduction in armaments or peace talk must diminish profits of those firms; and consequently there is a suspicion that some of the armament manufacturers have been active in creating anxiety about these subjects. The statement was made in 1932 by Sir Herbert Lawrence, Chairman of Vickers,—a man of the greatest possible distinction and position,—that:

"Reductions in armaments, under the influence of public opinion, both in this and other countries, have affected adversely your Company's trading result."

In the Report of the Senatorial Arms Inquiry a letter is set out—of course I cannot say whether it is an accurate letter or not—a letter from Sir Charles Craven, of Vickers, to Mr. Carse, of the Electric Boat Company of New York, in which he says this:

"The Admiralty also promise us the order for H.M.S. Clyde; but in this latter case they will have the right to withdraw their promised order for the second ship if Geneva, or any other troublesome organisation upsets the large submarine."

I think you will find a good many more instances of that kind. There is a letter from the Electric Boat Company to Sir Charles Craven, in which they say:

"It is too bad that the pernicious activities of our State Department have put the break on armament orders from Peru by forcing the resumption of formal diplomatic relations with Chile. My friends advise me that this gesture means that all contemplated orders must go over until next year."

Again, in a letter of the 11th August, 1932, from Mr. Jonas, another agent of an American company, he says, with reference to the Chaco War, apparently:

"I immediately took a plane to Washington and visited both the Paraguay and Bolivia Legations. Unfortunately for us, however, it looks as if the trouble they are having is going to be settled amicably."

Mr. Jonas was not a correct prophet, but that is what he writes.

And, of course, in addition to those rather well-known cases, there was the case of Mr. Mulliner's activities before the War, at the time of the scare about the German fleet; and the Roumanian case, a deplorable one, where apparently armaments agents put about a great rumour that there was a concentration of Russian forces on the northern borders of Roumania, and induced the Roumanian Government to purchase large supplies. As soon as the contract had been concluded the Russian troops vanished from the scene; apparently they had no more existence than those which came over to this country at the beginning of the War. There is no doubt that all this tends to hamper the actual efforts for peace. I think there is very little doubt that necessarily the whole of the armament industry were in favour—obviously they must have been—of continuing the supply of arms to China and Japan during that period when war was either actually existing or was on the point of breaking out. I have already quoted the passage about the Chaco.

Undoubtedly there have been cases, how many I cannot tell, in which active steps have been taken by great armament interests to prevent the conclusion of disarmament negotiations. The most striking of those cases was the activities of Mr. Shearer. That is not a matter of speculation at all because, as no doubt the Commission are aware, Mr. Shearer was employed by certain great firms in America to prevent, I think one must say, the success of the Disarmament Conference, which took place in Geneva in 1927. Afterwards, he was not satisfied with the payment made to him by those

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

armament firms and brought an action in the American courts for larger payments and explained the energy and vigour which he had shown in taking steps to prevent the conclusion of that treaty. I was present myself at the negotiations for that treaty. I would not like to say for a moment that it was entirely Mr. Shearer's efforts that prevented the treaty being made, but it is undoubtedly true that the suspicion and doubt which existed as to the policy of the British and American Governments produced the kind of atmosphere which brings about the failure of international negotiations. I cannot help feeling that it would have been a decided advantage if Mr. Shearer had not been present at Geneva.

It is not only actual intervention in international affairs which produces these serious results. There is no doubt that the armament firms, very naturally from their point of view, use whatever influence they may have—possibly legitimate influence—with the governments of their own countries, to prevent any steps which will interfere with the success of their trade. I have already quoted to you M. Briand's opinion, which is, I think, very clear and definite. There has been a good deal of discussion as to what exactly is the attitude over here with regard to the relations between the British Government and British armament industries. I do not think they are different from what would be the relations between the British Government and any other industries. I think they are very much the same. Sir John Simon, speaking on the subject in the House of Commons on 8th November, 1934, stated quite clearly:

"— we never allow our diplomatic or consular representatives abroad to act as travellers or canvassers for armament firms—never. Our diplomatic help is given only when a foreign State has announced its intention to purchase from abroad. Then our service naturally does its best to secure that the British firms should get a proper opportunity."

I do not know whether that is the right or the wrong attitude to take, but it is evident that that attitude must mean a certain relation between the government of the day and the armament firms, in which it will be at any rate natural to surmise that the influence of the armament firms will be directed to prevent the carrying out of a policy which will injure their trade.

Another illustration—again I do not desire to make any criticism, except in regard to the system. As you are perfectly well aware, arms cannot be exported from this country without a licence, but with respect to aircraft, though, as we know, aircraft are potentially at any rate military weapons, there is, as I understand, a general licence given, so that there need be no application for special licences for export. No doubt that is done with the perfectly legitimate object of facilitating the growth of a trade which is more or less in its infancy, and it is desired therefore to increase the output of those manufacturers. I quite admit that that is a perfectly legitimate point of view. The only thing is that, when you apply principles of this kind to the sale of weapons of war, you are producing effects quite beyond and apart from the direct financial or commercial interests, effects which may be of a very serious character politically and with reference to the preservation of peace.

You will perhaps remember that in the course of the long-protracted negotiations dealing with China and Japan in the Far East there was a period in which the Government announced an embargo on all arms for either party. I did not think that a very effective measure, because whereas Japan had considerable means of manufacturing arms, China had very few, and an impartial embargo was bound to operate in favour of Japan. Whether that was so or not, in discussing this matter, the Minister—not Sir John Simon but Mr. Duff Cooper, who was at

that time Financial Secretary to the War Office—said:

"In a fortnight we took off the embargo, but during those weeks we lost a great many orders. China and Japan did not get less munitions because of our embargo, but the men in this country got less work, less food, less employment."

That is quite true, and as long as you have any unilateral action of that kind it is perfectly true that you may do harm to your people without doing good to the general situation. On the other hand, it is perfectly clear that if the Government desire, for broad political reasons, to do their best for the negotiation of peace, it is a serious matter if they have to face, in addition to all the other difficulties, the difficulty that may be caused by great industries in this country which may be affected by their action.

That is, broadly speaking, the case. I have tried to put before you—I am afraid imperfectly—the evils and dangers which accrue from the present system. There will be other witnesses called before you, who will be able to give you many more details than I have of particular cases of injury that have accrued. To my mind it does not really require a great deal of labouring, because it seems to me perfectly plain that if you have great financial interests whose profits depend upon the existence of a state of tension or hostility between foreign countries, you must have, therefore, a great interest which will be impaired by a pacific policy and will benefit by a policy which is not pacific. That seems to me a very serious state of things. Possibly evidence will be given to you, but I am not going to trouble you with it, of allegations which were made in the American Inquiry and elsewhere of disreputable methods. I do not think from my point of view that has much to do with it. The fact that a particular agent of a government has been bribed is not the point. The point is whether they were working for the sale of arms. Whether they did it reputably or disreputably does not matter to my mind. Therefore I am not going to bother you with that. I have no doubt you could find evidence of similar things going on in a great many other trades dealing with governments.

Although I would not make the same kind of criticism about this point, there is no doubt that the existence of these firms does promote the active perfection of the various weapons. We have all seen it, of course. It is not a question of increasing the number, it may not even be so much a question of increasing the cost, but of improved weapons; to take an ancient instance, the substitution of the rifle for the smooth bore. The moment one country does it, every country has to do it; it is the same with a great many weapons which in our lifetime and in the last few years have been invented. You can scarcely take up a paper without seeing an account of some perfection, of some improvement—if we are to use that phrase—of the means of slaughter, which has been adopted in one country and is hastily adopted in others. That undoubtedly tends to a great increase of the national bill for these things. Perhaps that would not seem to be a matter of great importance, except that the cost of armaments, in my view, is one of the great causes of war, or at any rate of hostility. I think one saw that very clearly before 1914. Germany, for instance, was at that time arming against France, and perhaps against other countries, and undoubtedly the burden was felt very severely. True, it was a government which was not, of course, as despotic as the present Government of Germany. It had a Parliament sitting, and the various opposition parties were prepared to make capital against the Government on all those questions. The result was that you had undoubtedly a great deal of criticism as to the rising expenditure on armaments by Germany, and this is one of the important aspects of the whole of this question—this had to be met by a vigorous propaganda by the Government, showing the neces-

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

sity for the increase of cost. To do that they had to explain what they were afraid of, and that meant perpetually holding up as a possible danger to the people of the country the action of some foreign country. I think that aspect, which of course is part of the general case for the reduction and limitation of armaments, has its importance from this point of view, that anything that increases the cost of those armaments, as the competition between private firms must increase it, is one of the causes of this war propaganda, which must go on as long as the cost of armaments is as heavy as it is in many of those countries, and indeed in our own. I do not want to elaborate that but I am sure the Commission will be able to recall many instances of the kind of thing that has taken place in all countries, our own included, as the inevitable reason which any government must give for any increased expenditure on armaments. That seems to me the reason why control or nationalisation is essential.

I want to say just a few words about the answers that are commonly made in this matter, because I think they ought to be dealt with. The first answer that I should like to deal with is the one that suggests that the existence of private manufacturers is essential to the national defence, because in time of war it gives them opportunity for expanding rapidly a country's armaments; it is, as it were, a kind of reserve of strength. These private manufacturers have to keep their whole machinery in order, to carry on their own trade, and that can be diverted to the use of the government of the country in time of war, and that greatly increases their strength. I recognise that that argument, which is used strongly against nationalisation, is not applicable to control, because, of course, if you have control, the private manufacturers exist, and whatever advantage can be gained from their existence will remain. I should like to say a word about that argument in itself. This reserve is not really the result of private manufacture, but the result of exports. It is the fact that, as far as it is valuable at all, this reserve of strength is there because those firms are in the habit in peace time of supplying not only the government of their country but other governments. That is to say, it is export trade, which you can divert on the outbreak of war to satisfy the immensely increased demand which will arise in the country itself. I do not myself see that it would be altered at all if the factories were transferred from public to private ownership. I presume that in that case also—I will deal with the questions arising out of international law in a moment, but I am now speaking apart from them—there would be an export trade from these factories; they would exist not only to satisfy the legitimate demands of this country, but the legitimate demands which they were in the habit of fulfilling abroad. It is true that in such an arrangement it is reasonable to suppose that the government would not be so keen to maintain an export trade as would a private individual; that is possibly true. But I would reply to that, that as far as it is true at all, it is really an argument in favour of putting the matter in the hands of the government. In the public interest of this country and of the world you do not want a very active promotion of trade in arms. Where countries are actually in need of buying arms for their own defence, some means must, no doubt, be given of supplying them; and if they have no factories of their own they must buy from outside. I agree. But taking it broadly, there is no advantage, and very grave disadvantage, in pressing them to buy arms beyond what they think are necessary for their own demands. Therefore, though I think it is probably true that if the trade were not in private hands it would not be pushed with such energy as it is now, on balance that is a great advantage.

I am dealing with the view that these changes should be made internationally. I will say a word

as to whether, if you cannot get any international improvement, there ought to be an improvement in this country; but broadly speaking the argument that I am putting forward here is in favour of an international agreement for dealing with this question of private manufacture. And if that is true, the reserves of all other countries, so far as they are affected, would be equally affected with the reserves of our own country. But I would go a little further even than that. It is extremely doubtful whether this reserve argument has any very great value in time of war. There is one witness whom I think you might like to hear on that point—Mr. Syrett, who was engaged in the supply of munitions during the War—but we all remember that in point of fact very shortly after the beginning of the War the Government found that it was impossible to rely on private individuals and firms to supply the arms they required, and the whole of the munition business was taken over by the Government, for the reason that the reserve turned out to be inadequate. It was a mere flea bite compared with the demands that were made by the Great War. In addition to that, you have already had your attention called to the inquiry made by Mr. McKinnon Wood's Committee directly after the War, in which that point, I think, was very well brought out. I speak with only secondhand knowledge of that subject. I hope the Commission will have the opportunity of seeing all the records that exist on that point.

Chairman: I will say a word about that presently.—You know much more about that than I do. I will say no more about it. It is interesting to observe that that was confirmed by an observation made by M. Pierre Cot when he was here a little while ago. M. Pierre Cot was for some little time Minister for Air in France and he knows what he is talking about. He is very strongly in favour of the abolition of private manufacture. He made this observation:

"The Minister of Finance, M. George Bonnet, caused an inquiry to be made on the financial conditions under which nationalisation could be effected. The inquiry showed that the suppression of the private manufacture of arms would not involve any extra burden on the taxpayer. It would be possible to buy out the shareholders of the interested firms by means of bonds. The interest and amortisation of these bonds would be amply covered by the savings made by the State manufacturing these arms directly."

I think that was really the result of the McKinnon Wood Inquiry, that when it came to manufacture on a large scale it was cheaper for the Government to do it themselves.

The next argument that is made is that arising from the laws of neutrality, with which, Sir, you are very familiar. As I understand it, the difficulty is this, that under the laws of neutrality a government as such cannot supply arms to a belligerent: that would be a breach of neutrality. On the other hand, any private firm in the country can supply those arms, and therefore as long as there are private manufacturers in existence the smaller countries, which have not arms manufacturers of their own, can rely on supplies from those private sources, whereas they would not be able to rely on supplies from a government. It is interesting to observe that on the whole the Disarmament Conference has shown that there is very little feeling on the part of the smaller States in favour of this view. No doubt if you did this you would have to have some change in international law and allow the supply of one government to another in case of war. I will come to the question of who would be neutral in future wars in a moment, but you will find in this little hook—"Documents on the Traffic in Arms"—on page 27, part of a statement made, not by the smallest States, but by the Danish,

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

French, Polish and Spanish delegations. They say this, and I think it is rather a good statement and very much to the point:

"The fear of the non-producing States that the abolition of the private manufacture of arms would be detrimental to their interests is unjustified, as even in the present state of affairs arms are only consigned by a private factory with the assent of the Government on whose territory that factory is situated."

That, of course, is true whether there is a regular system of licences or not.

"At the present time the control over all exports of arms and munitions from their territory exercised by producing States in the sole interests of their national policy leads to the result that the non-producing States derive no benefits from the system of private manufacture. The abolition of this system would not therefore modify the situation of non-producing States in any respect."

I should think that is probably more true, though not absolutely, in the case of continental States than in the case of our own. I do not know, but I should not think that our Government control the export of arms very often in the interest of their policy, though they certainly do to some extent.

"There is already a tendency among non-producing States to create arms factories on their own territory with a view to making themselves independent of foreign countries in respect of the organisation of their national defence. This policy has nothing to do with the problem of the abolition of private manufacture, as from the point of view of a non-producing State it is immaterial whether it is dependent in time of peace upon supplies obtained from the factories of a foreign State or upon supplies from factories which, though private, are in practice under the control of a foreign State. Under the Hague Convention, belligerent States are only entitled to obtain new stocks from neutral private manufacturers and are prevented from procuring them from neutral State enterprises."

Of course, there would have to be some change in international law if the States as a whole took over the business of making weapons of war; but I venture to submit that the present condition of international law is extremely arbitrary on this point. A private individual cannot, without breach of neutrality, sell a warship to a belligerent State. That amounts technically to an "expedition," and at any rate in the *Alabama* case we had to pay £3,000,000 for allowing the export of a warship. On the other hand, I observe a movement in the United States at this moment, just as there was before the War, to prohibit export, even from private sources, to a belligerent, and that change might well take place. But in any case there seems to be no difficulty in making the necessary change in international law if the proposal that I have made were accepted.

In dealing with this question, it is, of course, right to consider the great change that must result from the adoption of the new system in international affairs. If the League system were in full operation there ought to be no neutrals at all; everybody is bound under the League system to go to the assistance in some form or another of the country which is the victim of aggression; therefore they would be bound not to supply the aggressor. On the other hand, they would be quite free to supply the country that was the victim of aggression and, indeed, it would be their duty to do so under the Covenant. In fact, at this minute we are, I understand, making a great effort to avoid supplying Paraguay with armaments. We are supplying Bolivia, because we have arrived at the conclusion that at this moment Bolivia is the country which is being

attacked and Paraguay is the aggressor. That would apply, of course, not only to State manufacture but to private manufacture also. So that the whole conception of neutrality undoubtedly will have to be reconsidered in the light of the new great international treaties. Certainly if the League system becomes established and accepted all over the world, as I hope it will be, and as I think probably it will, the question of neutrality will scarcely arise.

3. *Chairman*: Are you passing from the point of international law?—I was going on to the remedies now.

4. The only point I wanted to elucidate was this: On the second page of your printed memorandum it is stated, "They would also contend that the objection to the establishment of a State monopoly which arises from the present state of international law relating to neutrality could be overcome by the answer contained in the same joint memorandum and by other considerations of a like nature." I do not follow that. I could not find the answer. What we had in mind was the passage at the bottom of page 28 and the top of page 29 of this book*. It does not really come to very much. This is what it says:

"The problem of neutrality cannot, however, be considered solely in the light of the Hague Conventions irrespective of the other international agreements, more especially the Covenant of the League and the Pact of Paris, which have profoundly altered the legal and moral aspects of this problem. Can States bound by the Covenant of the League or the Pact of Paris use their neutrality as a pretext for treating a State which has resorted to war contrary to the aforementioned instruments, and a State victim of an aggression, on a footing of equality?"

I read that as intended to convey the kind of argument that I put to you in a rather more developed way just now.

5. *Chairman*: I quite understand what you have told us and I now follow what you say.—Thank you very much. We now come to this question of remedies. The latest and I think most effective scheme of control that has been proposed is what is called the American scheme, and again I ask you to hear Miss Courtney on any details of that scheme. Broadly speaking, that provides firstly—and this is much the most important thing, because it goes to the root of the whole matter—for the responsibility of national governments. Whether it is done by private individuals or in any other way, the government are to be responsible, and they must institute such a system of licences, both for manufacture and sale, as will make that responsibility a real one. The second great proposal of the American scheme is the creation of a Permanent Disarmament Commission. As no doubt the Commission is aware, that is a proposal that has been made for a long time past as part of any disarmament treaty. Everybody recognised that whatever you achieved in the way of international disarmament, it would have to be developed in some way, and for that purpose an organ for its development must be created, and that was the reason for the Permanent Disarmament Commission. But it was always imagined by those who were in favour of that Commission that among other functions it would have the development of any permanent disarmament treaty, and among its duties would be that of supervising this international trade in arms. I suppose the Americans felt that it was open to some doubt how far the full treaty would succeed, and therefore they propose that whatever happens you should set up a Permanent Disarmament Commission for the purposes of this part of its duties, and, of course, it can be used for other purposes

* "Documents on the Traffic in Arms."

1st May, 1935.]

The Right Hon. Viscount CECIL OF CHELWOOD, P.C.

[Continued.]

afterwards. Having set that up, there are to be returns made on the trade to this Commission, and the Commission are to have the right to send inspectors to examine and ascertain whether those returns in fact represent the truth about the matter.

Here I am in a little difficulty, because the proceedings of this Committee have so far been, I understand, nominally in private, but it is pretty well known what has happened in private, as usually happens in so-called private negotiations. The disadvantage is that there are generally two or three accounts of what has happened, instead of one. But it is understood that the British have proposed certain amendments, the most important of which is the abolition of inspection on the spot and the substitution for that of verification at Geneva. That is to say, all that the international authority would be enabled to do would be to receive returns from the respective governments as to what exports of arms were being made from each country, just take note of them, and, if necessary, I suppose, examine representatives of the country, who would merely produce their books to show that their statement was correct as far as those books went. I need not trouble you with it at this moment, but there is a dispute as to what exactly the returns are to consist of—whether they are to include the details of the export or only the general result of it; the amount in money and so on. That is one point. On this point I can only tell you what is commonly reported, that in fact these amendments are said to have received very small support besides our own from the point of view of numbers on the Committee. In one case I think they have received the support of one or two governments—the Italian, and perhaps the Japanese—and in the other the support, of an even less impressive character, of certain Asiatic states. That may or may not be true. I do not know. There was a suggestion that was made before the Sub-Committee sat, and therefore was made in public, that the Permanent Disarmament Commission should not be appointed and that some other machinery should be devised for that purpose. Then it is only right to add—though it has not so much to do with this particular point—that the British Government thought it desirable to have some provision made for facilitating an international embargo in cases where there was war. I am bound to say that in my judgment a good deal of the American draft would be better without the British amendments. I should certainly think, if you are to have any kind of returns, that merely to verify them at Geneva would be a very unsatisfactory procedure. I think it of great importance to get a Permanent Disarmament Commission appointed. I quite recognise that if you had a treaty of that kind, and in addition to that a disarmament treaty which fixed a limit both in numbers and value for arms for each country, then no doubt it would be a very considerable protection against the evils to which I ventured to draw your attention. Evidently, if there were no particular advantage to be gained by competition, since the countries' arms were limited both in number and in value, the danger of competition would be very much less; at any rate, it would appear to be so. Still, even as to that, as I have already pointed out, the competition in quality might remain, and whenever you have any competition in quality between the countries you have the dangers of canvassing and all the other dangers which must accrue when you have great financial interests engaged in a trade of this kind.

The other point that I would venture to mention about this question of control is this. It depends on a really efficient system of licensing, both for manufacture and export. In this country I have no doubt that such a system could be established; indeed to a very great extent it exists. But I do not feel at all satisfied that that would be true

of all countries. I think it extremely doubtful whether a system of licensing would be very successfully worked in every country. You have—as one, at any rate, of the members of this Commission knows far better than I do—a very elaborate system of licensing in connection with the sale of drugs. You have there, of course, all the conditions which make it effective, because you have a limit to the amount of drugs that may be bought by any country, and very strict control of the factories—which are, or may be, limited in number. My knowledge of the subject is very much less than that of some people, but I must say that such knowledge as I have rather indicates that very great difficulties, even in the question of drugs, have occurred. You have immediately a transfer of the factories from one country, where you have an effective system of supervision, to another, where it is hoped that you will have a less effective system of supervision. Those kinds of difficulties arise. I think the difficulties would be at least as great in the case of the manufacture of arms and, of course, if you did not have a limitation of arms it would be much more difficult to enforce any kind of effective licensing system. Undoubtedly, as long as great profits are to be made from a trade of this kind you will have, in some countries, a very great temptation to evasion; and I am afraid that that evasion would be successful in those countries where the system of government is either not so upright, or not so effective, as in this country.

Therefore, for that and other reasons, I personally approve very greatly the system of taking this matter into the hands of the various States. I do not propose to worry you with any description of how exactly that could be done. You will find a good description of one method of how it could be done in this pamphlet of the League of Nations Union, No. 359—"The Manufacture of Arms"—which, I believe, you have. You will find in Appendix III of that pamphlet a note by Mr. Noel Baker, in which he explains exactly how in his view the matter could be carried out. I am sorry to say that Mr. Noel Baker is at this moment forced to be away from England. I hope that before the Commission closes its business it will have an opportunity of hearing him, because he has made a very full and complete study of this question. There is a proposal as to how the transition difficulty and other difficulties can be overcome. I will not attempt to deal further with that. Colonel Carnegie, who is here, has given a good deal of attention to the subject, and will no doubt answer any questions.

I would refer only to one difficulty that has been raised about this matter, and that is the question of the definition of "armaments." It is said that it would be very difficult to confine nationalisation to armaments only. What are you to do about all the raw materials, and so on? I think the answer is rather well put at page 31 of this book, "Documents on the Traffic in Arms," in paragraph (9):

"The abolition of arms manufacture is not designed to concentrate in the hands of the State all manufacture that might serve to produce arms. The sole object is to reserve to the State that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes and destines it exclusively for military use."

You will have to have some definition of that kind whether you are going to proceed by control or by nationalisation. In the American proposals there are elaborate definitions of what exactly is meant by "armaments" for purposes of control, and whatever is meant by "armaments" for purposes of control would be equally applicable to "armaments" for purposes of nationalisation.

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

I am sorry to have detained the Commission so long. I have nearly finished my observations. Broadly speaking, I would like to submit that the case for some drastic change in the present organisation of the industry is overwhelmingly made out and is not really disputed in any responsible quarter. I could have quoted statements of the present Prime Minister bearing that out. Without suggesting for a moment that the only cause of war is the operation of the armaments trade, because that would be a fantastic exaggeration, yet I do not doubt that it is one of the considerable obstacles to any system of world pacification, and that it is a very serious and important matter. Indeed, the appointment of this Commission shows that the Government is of the same opinion. Finally, I submit to you that as between control and nationalisation the broad point is this: That if you leave the manufacture and sale of armaments in private hands, the only motive that is, or perhaps ought to be, operative, apart from general rules as to decency and propriety of behaviour in particular cases, the only big motive must be the motive of profit. It is primarily the business of the directors and employees to make profits for their company; whereas if the supply is made by the government the question of profit becomes of minor importance. It is not absolutely excluded—no doubt they desire to carry on their business profitably—but it is a matter of minor concern. The main business of this government, and almost every government, must be the maintenance of peace and tranquillity in the world. That is, and must be, the chief interest of any government that knows its business in the present state of civilisation. Therefore, they will have to consider that aspect of the matter much more than the aspect of the matter which depends on successful trading. For that reason particularly it appears to me that it would be better if the government took over the whole business and took it out of private hands.

6. *Chairman*: Thank you very much. The first question I would like to ask you is this: You have from the first, have you not, been very much interested in the proceedings at Geneva, and have taken an active part in them?—Yes.

7. I think you were one of the draughtsmen of the Covenant, were you not?—Yes.

8. Looking through this mass of papers with which we have been supplied, I find also that at one stage you were chairman of a small committee appointed by this Temporary Mixed Commission to consider some proposals for limitation of armaments, which were brought forward by Lord Esher?—Yes.

9. I also find this, that you added a proposal, which was adopted by the Temporary Mixed Commission in this form: "No scheme for the reduction of armaments can ever be really successful unless it is general"—Yes.

10. That is still your opinion?—Certainly. From the point of view of the League of Nations, which is an international body, evidently no scheme for the reduction of armaments by one country is going to do the business.

11. And when you use the words "unless it is general," you mean substantially, by all the Great Powers?—Certainly.

12. Of course, we have not directly to deal with the question of limitation of armaments. What we have to deal with is this question of the control or prohibition of private manufacture. That is directly, is it not, a matter ancillary to the question of limitation?—That is my view.

13. I notice in the conclusion that is put forward on page 23 of your pamphlet No. 347, that your Committee go so far as to say this: "Whatever measures can be agreed upon for the control of the manufacture, purchase, sale and export of arms, it is of great importance that they should form an integral part of the General Disarmament Treaty." Do you agree with that?—Oh! yes, it is

of great importance. I would not like to be understood as saying that something of advantage might not be done by individual countries as far as the control of private manufacture is concerned.

14. That is what I am leading up to. The next thing which I want to ask you about is this: The question with which we have to deal, that is referred to in that passage, is one of great difficulty, is it not?—Yes, it is evidently of great difficulty.

15. And Lord Halifax, in the speech which you have quoted already, refers to it in this way: He says the Government were led to appoint this Commission for two reasons: First of all, because they realised the strength of public feeling—you have dealt with that—and also because they realised what I think the general public does not always realise, the extreme complexity of the problem and the issues that are bound up with it. Would you agree with that?—I think it is rather easy to exaggerate the complexity. I have not much doubt that if the governments of the world agreed that it was a desirable thing to do, it could be carried out without much difficulty.

16. Complexity involves the difficulty of getting everybody to agree, does it not?—It certainly involves difficulty, if it is to be done properly and effectively. I will not say you cannot do something individually, but to get it done properly and effectively involves agreement among certain of the larger producing countries.

17. I see that in this pamphlet, No. 347, your Committee say, on page 3: "The Committee has met on several occasions, and, having considered the problem in the light of all the relevant official documents issued during the Disarmament Conference up to the present date, is not able to recommend that the General Council of the Union should, at this stage, be asked to adopt a detailed policy on all the aspects of a complicated and delicate subject"?—Of course, this is earlier than the other pamphlet, No. 359, from which I quoted. No doubt there has been a certain progress of opinion in the Union. Indeed it is stated in our printed document that there is a difference of opinion as to whether control or nationalisation is the appropriate remedy, and in making my statement coming down on the side of nationalisation, although, I believe, I represent the great majority of the Union, I do not want it to be understood that I am pledging every member of the Union. I know there are some who strongly disagree; they think that control is the appropriate remedy. Certainly at the date that this pamphlet was written it was a matter of—I do not know what words were used then—great delicacy and difficulty; but I do not think you must press those words too far, because they had some regard to the internal conditions of the Union.

18. I do not know whether you have had your attention called to a document which has been supplied to us, which is a report prepared by Mr. Manley Hudson presented by the American Committee in Geneva to the United States Committee of Inquiry. Have you seen that?—I expect I have seen it. I have not it in mind.

19. In a passage on page 2 he says: "Article 8 of the Covenant of the League of Nations, originally proposed as a provision for the abolition of private manufacture, states that the private manufacture of arms and ammunition is open to 'grave objections' and envisages measures to prevent its evil effects." Then he goes on: "For 14 years, various agencies of the League have been engaged in an endeavour to deal with the problems connected with private manufacture. First the Temporary Mixed Commission, then a Committee of the Council, then a Special Commission, then a Committee of the Disarmament Conference, have occupied themselves with the problem, and each year for 10 years or more the Assembly of the League of Nations insisted that something be done. The contest has waged chiefly over the proposed abolition of private manufacture; short of that step a licensing system was proposed

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

for private manufacture, with publicity required as to both private and State manufacture." That is a fact, is it not?—Undoubtedly there was a very strong division. I think you will probably find in the Temporary Mixed Commission's debates a very considerable difference of opinion as to whether nationalisation or control is the proper remedy; in fact I think the Temporary Mixed Commission reported in favour of control as the only thing upon which they could get something like unanimity. They were all in favour of control but they were not all in favour of nationalisation. I was at that time representing the British Government and I suspect that you will find—I have not looked back at the record—statements in which I advocated control, rather than abolition, as the practical thing to be done at that moment. But since then there has been a very considerable change of opinion on the subject internationally. At that time the United States were vehemently opposed even to control. They said it was impossible for them to do anything, because of their constitution. They have now abandoned that attitude altogether, and they say they can propose control. In the same way the French Government have now become much more definitely in favour of nationalisation than they were then. At that time the French members were divided in the Temporary Mixed Commission, some being in favour of control and some in favour of nationalisation. Now, I believe, they are all in favour of nationalisation.

20. The present proposition which is under discussion, the American proposition, is founded upon control, is it not?—Yes, it is. What has happened, as I understand, is that there was a debate in the Conference itself. A considerable number of people, including the French, argued vehemently for nationalisation. The British Government in effect expressed itself as hostile to nationalisation at that time, and in view of that the Committee has been seeking some measure short of nationalisation which they think might receive international unanimity, and that is the origin of the American proposal. I understand that that is what has happened, but, of course, that does not alter my opinion as to which would be the more desirable if we could get it.

21. It is extremely important, is it not, to come to some agreement if possible?—Yes.

22. And one may have to give way on one's own convictions in order to secure agreement?—Unquestionably. That is, of course, true of everybody, and you have to have in international matters, as you are well aware, and particularly matters of this kind, if not absolute unanimity, unanimity of the more important Powers, in order to do anything effective. Therefore it might well be, even if the British Government could agree on nationalisation, they might find it impossible to secure unanimity on that point. I can only say this: I should very much like the British Government to try. I have a strong feeling, from my experience of Geneva, that if the British Government were to go all out for any of these proposals, their position in the world is such that the prospect of unanimity would be very great.

23. Are you acquainted with the grounds upon which the British Government have put forward their proposed amendments to the American scheme?—Not more than appears from that speech of Lord Halifax; I have no private information, and if I had I am afraid that I should not be at liberty to give it to this Commission without the leave of the Government. As matter of fact I have no private information on the subject.

24. We have been supplied with a statement which indicates that the British Government's proposal is put forward upon the ground that it is more likely to receive general acceptance than the American original proposals.—I know.

25. They may be wrong, but that is the ground they have taken.—You are taking me on the very broad ground of policy, but I have no objection at

all. I would say it is a pity for the British Government to take that kind of attitude. They must make reasonable proposals, of course; but if they think one proposal is the right proposal, they should make that proposal, and let other Powers make objections. My experience with the League is that if you do that with vigour, if you are right, you will find an extraordinary rally to your opinion. I should like the British Government to put forward a proposal for definite abolition, and say that in their view that was the proper remedy. If they did that, although I cannot tell for certain, I believe the Germans would accept it and I think all the smaller Powers would accept it. You might have difficulty with the Americans—I do not know—but you would certainly have a very large majority of acceptances, and then it would be a question whether the countries which were opposed to it, whoever they might be, would think it worth while to hold out against something which the great majority of the governments desired and probably an even greater majority of the peoples.

26. Your Union recommends us and recommends the Government to accept the American proposal?—Oh! yes. I certainly recommend it. It is a stage in the right direction.

27. We have to consider the grounds on which the Government is putting forward these amendments?—Yes.

28. And to take the whole matter into consideration?—Certainly. There is another argument that they have used in public. They think it would be a simplification to avoid these inquiries on the spot, and, of course, it would be a simplification to get rid of the Permanent Disarmament Commission. I am not clear whether they are prepared to insist on the latter point. From the language of Lord Halifax I should gather they would not be prepared to insist on it if they found a majority of the Commission were in favour, but on the question of examination on the spot I admit that this would not be so simple a business as merely to send in reports to a central body at Geneva, which you must have if you are going on with that Convention, which in any case I think you ought to do.

29. May I now consider more closely the terms of our reference with reference to your evidence. What we have to do is "To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (a) by the United Kingdom alone, (b) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trading in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade." You have the terms of reference, have you not?—Yes, I have them before me.

30. With regard to the limitation of armaments, you have expressed the opinion that no scheme can ever be really successful unless it is general. Would your opinion be the same in reference to those two points that we have to consider—prohibition or State monopoly?—I should certainly say it can never deal with the whole evil unless it is general. The broad evil is the existence of financial interests which are in favour of war and hostilities, and unless you can get rid of all those financial interests you are evidently not dealing with the whole evil. I should say there was no evidence, to put it mildly, that the British manufacturers were the worst. Therefore if you only deal with the British manufacturers you only deal with a fraction of the whole evil. In that sense I have no doubt at all that the proper thing to aim at is a general scheme.

31. Assuming we start from the point of view that it is, I will not say absolutely necessary, but that it should be general to be effective, then it would lose a great deal of its power and influence if it is not general?—Certainly.

1st May, 1935.]

The Right Hon. Viscount CECIL OF CHILWOOD, P.C.

[Continued.]

32. In considering the question whether from a national or international point of view it is practicable, must not one consider the possibility of agreement?—Yes.

33. Can you say it is practicable from an international point of view unless you come to the conclusion that there is some probability of agreement?—I think the best way of ascertaining the probability of agreement is to try. That is where I respectfully disagree with the policy of the Government. I think it is a pity to go about making private inquiries too much beforehand, because I think people are much more unreasonable in private than they are in public. If you put forward a proposal which is in itself reasonable and commends itself to the general opinion of mankind, I think you will find that governments are reluctant to oppose it in public, and particularly if it is put forward by a Government of the authority of the British Government. I need not go into the international position, but everybody knows that in the world as it now exists we must have a very exceptional authority compared with other nations. We stand a little apart, and on whichever side we throw our weight it will probably be decisive. Therefore we have immense authority and responsibility. And in my view, the best way to ascertain what is practicable is to put forward our proposals reasonably—not putting them forward as an ultimatum and saying, "There they are, and we will not take anything less". Let us hear what the objections are, and if they are insuperable you will have to make concessions. Anybody who has had experience of Geneva knows that you do not get exactly what you want in the first instance. You put forward your proposals, you see what objections are made, and, as in Parliament, you accept amendments in order to get general agreement.

34. That is so far as the international point of view is concerned. From the national point of view, Parliament can always do what it wishes?—Yes.

35. But either course is of very little practical value unless it is general. Is there much practical value in any one country alone adopting either the one or the other?—There are two questions. As to this, I shall have to be rather careful as to exactly what I say. There are many people who would say that this trade is so repulsive that it ought to be abolished, like the slave trade. Exactly the same arguments were used when it was a question of the abolition of the slave trade. It was said, "You should not abolish it; all you will do is to injure British trade". All sorts of arguments were used, and very highly respectable people were vehemently opposed to touching the slave trade. They thought it would be disastrous not only to the fortunes of the people engaged in it, but to the fortunes of the country. The very strongest language was used. If you take the view that I myself take, that this is a trade comparable to the slave trade from the moral point of view, then I am certain that you ought to abolish it in this country in any event. That is to say, you ought to abolish the element of private profit. If you can so control private profit by such measures that you can get rid of that first motive, and yet keep alive private manufacture, I should see no objection to it; but I think it would be very difficult in practice to do it. Therefore I am personally in favour of the abolition of private manufacture in this country even if the other countries would not agree. I fully agree with what you are suggesting, that from the point of view of putting an end to the evils of the system, the adoption of those measures by one country would evidently be of infinitely less importance than a general adoption. That is approaching the question from a moral point of view. From the financial point of view, I do not see any reason why you should not do it in this country; I do not see that it would hurt us at all to do it. I do think that it would not be very much good from the point of view of getting rid of the whole evil; that is to say, you would still leave quite a number of sources of the evil; you would only get

rid of some, and perhaps not the worst, sources of evil, if you abolished the trade in this country. But I do think you have got to consider the moral aspect of it. To avoid the use of the word "moral" I have said "emotional" in my evidence, but "moral" is the more correct term. It is important in a democratic country to have that in mind, and one must not forget that the example given by this country would be of some value—one cannot know how much—as it was in getting rid of the slave trade. We abolished the slave trade in our own country and everywhere in our possessions, or the greater part of them, at considerable cost, and for some time other countries did not follow our lead, but they did follow it eventually; and at the moment there is no difference, at any rate on the statute book, between us and all the other civilised countries on that point.

36. The next point I ask you to consider is this: Supposing it is practicable to come to some general agreement about creating a State monopoly and abolishing private manufacture, what would then be the position? "Arms"—I will use the general term—would only be procurable from the State, but the State could still continue to employ a private firm to manufacture arms? The setting up of a State monopoly would not put a stop to that? It would have to be very carefully controlled?—Obviously, if the private firms were allowed to have any voice in the sale of the exported arms, it would merely be introducing by a back door the evils that already exist.

37. What was in my mind was this, that unless there were some form of general limitation of armaments it might suit some governments to turn trader?—Yes, it might.

38. It might suit some governments to make a profit and to employ private firms to manufacture for them?—Yes.

39. Then does it not necessarily follow that a State monopoly without limitation of armaments would be of little value?—I think it would be of much greater value with a limitation of armaments, as indeed anything that you are going to do with armaments must be, but I would not quite agree with you that it would be of little value. If you had all armaments manufacture in the hands of the State, I think you would have very much less probability of the kind of evils that admittedly exist in the trade. You could scarcely imagine, for instance, a State employing a man like Shearer to go and prevent the conclusion of a treaty for the limitation of armaments. They would not need to do that, and they would not do it. And it is very difficult to imagine that the so-called Skoda scandal in Roumania, or the so-called Mulliner scandal, earlier, would have occurred if the supply of arms had been in the hands of the State. I cannot imagine that you would get the same kind of scandals or evils. That there would be at times a motive for the State to supply arms, I do not deny. But it seems to me that States have so much larger and wider considerations to govern their policy, than the question of making a little profit out of arms; because, of course, it is a little profit compared with other State interests. They are less likely to be moved by motives of profit to do things which are against the peace of the world.

40. Thank you. That was all I wanted to ask on the first branch of our reference. The second branch of our reference deals with abuses. I notice in this little pamphlet issued by your Union, No. 347, under the heading "Evil effects of private manufacture", your Union adopts the description of the abuses which were contained in the Report of the 1921 of the Temporary Mixed Commission of the Assembly of the League. You will find that on page 4.—Yes.

41. That is rather a formidable list, is it not?—Yes.

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

42. You think it is fairly exhaustive?—I should think so. I remember very well that being put in. It was not put in as the view of the Temporary Mixed Commission. It was put in merely as a statement of the kind of objections that we knew, from the evidence given to us, were made to this trade.

43. This question of the abuses in the trade is really a minor concern, is it not, compared with the major question of control or limitation? We are not considering the question whether you can get rid of abuses and by that means be relieved of all the difficulties in connection with the trade; the question we are asked is whether or not by prohibition or control you will so regulate matters that these abuses will either die or be perceptibly diminished. For instance, if you have a State monopoly, as has been pointed out just now, you can hardly assume the possibility of the continued existence of those abuses?—No.

44. And the same if you have effective control, the possibility of this class of abuse is very much diminished?—Yes. The difference between the two remedies is that by substituting the State for the private individual you would remove the temptation to commit those offences, whereas by the imposition of control the temptation would still remain, though you might be able to prevent that temptation having practical results.

45. The question of the existence of these abuses is only an incident in the whole question? Our decision does not depend upon whether it is possible to get rid of the abuses or whether it is possible to reduce the abuses?—I am not sure that I should be able to assent to that proposition as you state it now. I should have thought that, granted the existence of the kind of abuses which I indicated, and which are indicated in a number of papers, the object of this Commission is to suggest the best way of getting rid of them, having regard to other considerations.

46. You think the best way would be either by controlling the trade or by nationalisation?—I am afraid I am not following exactly your question. If you mean that, for instance, armaments manufacturers should not have any newspaper connections, I should not think that at all a useful proposal, because it could be evaded directly if they wished to do so. In the same way, if you were to go into many of the matters raised before the American Committee of Inquiry—the question of agents, of bribery of governments, and that sort of thing—those do not seem to me to have a direct bearing on the subject that you have to consider. That is my feeling.

47. That is what I am endeavouring to find out from you, but I do not wish to go through this list in detail. There are one or two questions that I would like to ask about what you have just told us in the statement of your views. You said that you thought that the cost of armaments was a direct incitement or inducement to war. Is it the cost? Supposing, for instance, a State decided to increase either its army or its navy, its neighbour would act upon that, not upon the question of what the cost would be. It is the fact that its neighbour is increasing either its offensive or defensive forces that is the inducing motive for action, is it not?—What I meant by cost was this: I took the condition in Germany and to some extent in France before the War. There you had perpetual increases made in the German army and navy, one after another. Of course, the increases were reflected in the budget; taxes had to be imposed; everybody who was familiar with Germany said there was a very considerable irritation at this growing cost, and in order to meet that irritation the German Government had to explain why that cost was necessary. In doing that they had to say, "We have got to increase our cost because"—in effect they said—"without that we shall not be able to resist France, and we regard France as the great danger." The

same thing is happening at this moment in Germany. The case for the recent German action has been their fear of attack by France. They say they are at the mercy of France; that France at present has overwhelming power. The Germans say, "We are not only at the mercy of France; we are at the mercy of any foreign Power as long as we are not allowed to rearm." They have put that across in Germany to a great extent, so you have great popular agitations in favour of rearming, so as to make them safe against foreign danger. That necessarily involves the elevation of one or more foreign Powers as the potential enemies of Germany, and that means, of course, an increase of the difficulty and tension and ill-feeling between those countries. Unless I have entirely misread the years before the War, that was one of the great causes of the state of feeling in Europe which, when the murders took place and the match was thrown in, resulted in the general blaze. It was the attitude of hostility and general enmity. I could quote the late Lord Grey to that effect. He made very strong statements that it was the piling up of armaments against one another, and all the accompaniments of that, which created the state of mind which led to war. I do not know whether I have made my point clear.

48. Yes. I should have thought myself that the cost was a deterrent. You take the other view?—Of course, no doubt it makes governments less anxious to spend money—at least, some governments—but the point is that once they have made up their mind to spend the money, they have to justify that expenditure, and in doing so they have to arouse the national feeling and the xenophobic feeling in their own country.

49. Just one question about the trade generally: I understand that your view is this, that the trade is so well organised, and takes such full advantage of all the opportunities afforded by the Press and so forth, that it has acquired an influence which is a danger and which ought if possible to be reduced; not that the trade is in itself from this point of view any worse than any other trade. It is not carried on in a worse way than any other trade?—No.

50. But the fact that it deals in armaments, and is so well organised, and is taking advantage of all the opportunities of Press publicity, makes its influence a danger?—I would rather put it in this way, that the existence of the principle that armaments should be a source of profit is bad in itself. In so far as it has an influence, that influence becomes obviously greater in proportion to the existence of the trade; and the more you can show that this trade extends to a very large degree all over Europe and—not more than any other trade, I agree, although I do not know very much about trade—has relations with other countries, it must have a very powerful influence.

51. *Dame Rachel Crowley*: I had a very large collection of questions to ask Lord Cecil after reading through the Union's paper, but he has answered a good many of them in his presentation of the case. I was also going to raise the question that the Chairman has raised in this last discussion. Therefore, I am rather more limited than I expected to be. I would like to go back, if I may, Lord Cecil, to some of the details that you quote, and particularly to the Chaco case. I was very much impressed, in reading the Union's Outline of Evidence, not only by what you say in the Annex, in Note A, but by what you say on the first page. "The continuance of the war between Paraguay and Bolivia, despite the repeated efforts of the League of Nations to bring it to a conclusion, was made possible, according to the report of the Chaco Commission of the League, by the constant supply of arms to the belligerents by armament firms in other countries." Then, under Note A you say that those arms were supplied to the belligerents by American and European countries. I should very much like to ask if you have any reason for believing that British firms,

1st May, 1935.]

The Right Hon. Viscount CECIL OF CHELWOOD, P.C.

[Continued.]

or firms created as British firms, took part in the supply of arms in this particular war or are taking part in the supply?—I think you had better ask somebody else about that, Dame Rachel.

52. Perhaps evidence will be given by one of your colleagues?—I should think so. I think the evidence, broadly speaking, is this, that there was a very considerable export from this country of ammunition to both Bolivia and Paraguay. There was a certain export of arms, but not so large. I have here the whole of the figures, which I believe come from the Board of Trade, and I shall be very glad to hand them in if you like to look at them.

53. *Chairman*: We have got them already, I think. *Dame Rachel Crowdy*: I do not know whether it would be in order to ask the names of the firms who exported?—No doubt the Government could tell you; I could not.

54. They were presumably exporting under licence?—They must have had a licence, I presume.

55. From the Board of Trade?—I presume they had a licence. I do not know anything about it.

56. *Chairman*: We shall get that evidence from the proper authorities and from the firms, no doubt?—I am afraid I cannot go any further.

57. *Dame Rachel Crowdy*: I should like Lord Cecil to expand his statement on the comparative efficiency of private manufacture and State manufacture as he himself knew of it in the Great War. It is a very interesting problem. One heard people say so often that efficiency would suffer if private enterprise were abolished?—Mr. Syrett knows more about it, but my recollection is that this is what happened originally. The Government found that they required immensely more armaments than they had anticipated—than anybody had anticipated, when they saw the kind of numbers that were engaged in the War—and the official provision for it was, of course, quite insufficient. They then turned, in the first instance, to the various armaments manufacturers, and gave orders for various things. I am speaking out of my own recollection, which may be inaccurate. They found that in point of fact the armaments manufacturers combined to pool their own resources—that they were unable to act independently—so that in fact the Government only got one additional source and that at a very considerable price. After trying that for a comparatively short time they set up the Munitions Department with the view of taking over the whole supply, the import as well as the manufacture of munitions. Then, under the inspiration of Mr. Lloyd George and other people, they expanded that to an immense extent. I do not think I am committing any breach of confidence when I say that I remember hearing from Sir Eric Geddes, who had a great deal to do with it, the kind of feverish activity in which they were engaged in order to create this gigantic State monopoly, and from that moment the private firms faded out altogether. They no longer had any independent existence—at any rate they did not play any considerable part during a large period of the War—and from the Report of the McKinnon Wood Committee, which examined the question, I believe you will find that the Government found that, although it was frightfully expensive doing these things, it was not so costly as if they had had to rely on private enterprise. But I am speaking with all reserve. I have not looked right into it.

58. If a State monopoly were set up, you do not think it would lead to loss of efficiency?—I see no reason to think that it would. And, after all, it is not as if we were starting a new State experiment; there is a very large State manufacture at present, and I think you will find that those at present engaged in it will hotly deny that the State business is any worse managed than that of private firms.

59. The only question is whether there would be an increase of cost because competition would be removed?—You would have the internal competition removed, certainly.

60. And profit making would be abolished?—Profit making would become a very minor consideration. That is the main point, and so far as this country is concerned it would not have any influence on policy at all.

61. I, and I think the other members of the Commission, very much wanted to hear an expansion of your proposals for nationalisation and how you think a monopoly could be brought about. I imagine from what you have said that that matter will be dealt with by later witnesses?—You will find that by far the most elaborate version of it that I have come across is in Appendix III on pages 24, 25, 26 and 27 of Pamphlet 359. There, I think, the whole of the difficulties—at least, all that occur to me—are faced. Probably Colonel Carnegie can give you detailed information on that point, if you require it. I cannot give you any more.

62. I was particularly interested in the national board which is spoken of, and I wondered if we should hear more about that?—I think I must leave that to those who are rather more technically equipped than I am.

63. *Mr. Spender*: One of my difficulties personally is to get into my head the proper definition of an armament firm. As one reads the Proceedings of the American Inquiry it is brought home to one that to make the armament firm the sole villain of the piece is to let other people off much too easily. The firms which seemed to play the greater part were not the armament firms in some cases, but the great Steel Trust. Mr. Shearer, whose name has been mentioned here, was, I think, the nominee of the steel industry?—Yes, the Bethlehem Steel Corporation.

64. And again in France it is not the armaments firms which have this influence over the Press—it is the Comité des Forges?—Yes.

65. If we are to nationalise, how are we to prevent the same profit-making going on by the great industries, and the same pressure being brought to bear by them on governments as is now attributed to the armament firms? Take the chemical industry?—I quite agree that that is a point which has to be met, but I think the answer to it is this, is it not, that the greater part of the evils arising from this trade, if not the whole of them, arises from the attempts to sell the finished article, and the question of whether they are going to supply a certain amount of steel to the government—I take that case—for the purpose of manufacture of armaments would not be a very important matter to them. They would not have any substantial control or any means of controlling the amount of steel that the government would require. The test that is suggested in the passage that I read just now is this: Is the product, which is being made, ready for use as a weapon of war? It is that process which constitutes the essential part of armament manufacture. As long as that process is in the control of the governments, and then they really have the means, and the duty, and the inevitable power of preventing the abuses which take place.

66. If one applied that to the agitation of, we will say, Mr. Shearer and other similar agitations which I myself have witnessed in Washington and elsewhere, would it make any substantial difference? Because there you had the ship-building interests, and the effort of the propagandists and their lobbying was directed to keeping up the level of ship-building in order to make profitable business for steel concerns?—It is conceivable that if the only people who were to be the sellers of the cruisers that were in question in the Shearer case were the governments, the Bethlehem Steel Corporation might have

1st May, 1935.]

The Right Hon. Viscount CROIL OF CHELWOOD, P.C.

[Continued.]

thought it worth while to send out Mr. Shearer because they were afraid that the result of an agreement would be to diminish the demand for cruisers, and consequently the demand for steel.

67. He was doing that?—Yes, but it was much more than that. It was the direct demand for the guns and the actual ships that he was concerned with. There would be an indirect demand for the raw materials no doubt; but in that case the motive surely would be infinitely less for private firms to spend money on sending out individuals to prevent international agreement. And in any event such agents would be met by the representatives of the governments in whose hands were the actual furnishing of those guns. I should have thought they would thus be in a very much weaker position.

68. I do not want to press it, but it is a rather important point. All these concerns would have very great interest, especially in naval production, in keeping it at a high level?—I admit that the existence of arms must make a demand for steel, and for coal if you like, and that therefore you might say that the coal miners ought to be sending out people to stop these negotiations. But they do not. When you get far enough from the finished article, the motive becomes so attenuated that it is not worth while spending the money. I am afraid I cannot give you any better information.

69. I have read, in the Proceedings of the American Academy of Science, an article in which somebody who was watching the American Inquiry argues that it must lead to nationalisation of everything?—If that happened you would have to take fresh measures, that is all I can say.

70. *Professor Gutteridge*: As a matter of fact no country had a State monopoly before 1914. That is correct, is it not?—I should think it is correct.

71. So that we have not any experience at the moment of what the position would be if there were a State monopoly and war broke out very suddenly. We are facing a new situation there, are we not?—I suppose we are.

72. And I think you would agree that that is the kind of thing we have to consider amongst other matters?—Oh, certainly.

(Adjourned for a short time.)

On resuming:

84. *Professor Gutteridge*: You suggested that it might even be a good thing for this country to adopt nationalisation unilaterally?—Yes.

85. Would not there be a certain difficulty there? That is what is rather troubling me. We should have to change over from our present system to a State system at a time when nobody else was doing it?—Yes.

86. It would be a disadvantage whilst that process was going on, would it not?—I do not think so. Of course, we have a State system to a very large extent; we have Woolwich, for instance, and other State factories, already. It would merely be extending that part of the system and diminishing the other part.

87. But it would mean, would it not, the establishment of new factories and a certain amount of absorption of labour, and so on?—It might; but I should have thought the probable course would be taking over certain portions of the existing factories.

88. You mean buying them out?—Yes; or giving them stock, or something of that kind—government stock—and buying them out in effect.

89. That would cause a good deal of dislocation for the time being, would it not?—It might. It would not necessarily have to be done all at once; it would be a thing that you would do gradually. I do not pretend to be an expert.

90. I was not suggesting that. I was wondering whether the point had occurred to you; that is all?—Yes, it has occurred to me.

73. We have to consider the national safety?—Without a doubt. If you are satisfied that the existence of private manufacture is an important element in national safety, you will give it great weight.

74. The thing is experimental to the extent that it has not yet been put to the test?—Yes, but the answer to that is that if it were put to the test it would be a good thing.

75. I am not saying that it would not, but there is that possibility that I have indicated?—Yes, I am not saying that the other system would not be equally good; all I am saying is that it was not an effective element in the national defence during the Great War.

76. The situation would be different in the case that I am putting to you, that of a State monopoly and a sudden outbreak of war. That is a situation that, so far as I am aware, has never yet been put to the test?—I suppose that is true.

77. I am anxious to have your views about this. Do you not think that there are certain difficulties in the way of inspection on the spot in a system of control?—There are great difficulties.

78. It would lead to a great deal of friction, would it not?—I do not think so, if it were a general thing. Of course they had a very elaborate system of inspection on the spot after the War.

79. It was unsuccessful, was it not?—I would not say that.

80. There was a great deal of evasion, was there not?—Not according to one view. There was very little evasion; there was some evasion no doubt, but I should have thought that, broadly speaking, it was fairly successful. The difficulty lay in the fact that it aroused such violent national feeling; it was the imposition of inspection on a beaten country. Here it would be inspection to show what were the actual resources of the country in armaments.

81. There was a certain amount of *amour propre*?—Oh, yes, it became a patriotic duty to evade disclosure. But if the kind of inspection now contemplated were instituted it would be instituted by agreement.

82. We should have to modify our national legislation, should we not?—I should think so.

83. The Official Secrets Act and so on?—Yes.

91. Is there not rather a dangerous transition period there? Let me put it in this way: There would be a period of transition which might be dealt with possibly by negotiation, if we did it unilaterally?—If the opportunity came about of doing it, you would have to do the thing reasonably, obviously.

92. *Sir Thomas Allen*: You quoted a statement made by Lord Halifax in the House of Lords? That statement did not express either his view, I take it, or the view of his Government; but rather was his idea of the position that public opinion had reached at the present moment with regard to the position of arms?—I think you are probably right; it was summarising public opinion rather than expressing his own; at any rate, that part of it that I read. He went on to express his own opinion later.

93. He laid a good deal of emphasis on profit motives?—Yes; that is the thing.

94. Telling us that public opinion is deeply moved by the fact that profit is derived from making and selling armaments. Are we to understand by that the elimination of the profit motive?—I should think so, certainly; that is to say, private profit and all that that brings with it.

95. But you would agree that the arms manufacturers are not the only people who take profit out of the traffic in arms?—I should think that probably is true. Obviously the shipping companies take part, in their freight business, and so on.

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

96. But are not enabling credits put up and loans floated sometimes by State action, with State authority? To put it in another way, firms could not effect sales at all unless loans were advanced previously?—I am afraid I do not follow your question.

97. Enabling credits are put up for the various nations to buy the armaments; the armament firms themselves do not give credit to the various nationals who want the armaments?—They sell to the governments, of course. Under our system they cannot sell, as I understand it, to private individuals; at any rate, not to any large extent; they have to sell to governments.

98. And the governments themselves would float the loans?—The foreign governments would float the loans, no doubt.

99. Would you agree that whilst armament makers make their profits in the main from economic motives which lead to one country quarrelling with or conquering another, that does not come from the armament firms?—I should think it was very, very exceptional that the sale of armaments is the main motive, but I think the existence of the system does contribute very largely to the keeping alive of that kind of frame of mind between nations which is the main motive.

100. Assuming for the moment that armament firms have profited vastly by the war between Paraguay and Bolivia, the gain sought there is sought by both sides for wider territory, is it not?—No doubt.

101. There is a motive sometimes greater even than the motive of armament firms getting profit out of war?—Certainly. The actual proximate motive of war is obviously not the armament firms; it is the motive of the countries; but the armament firms or the system, rather, of selling armaments for profit does, in my judgment, contribute very largely to the atmosphere which renders those motives the effective and particular cause you mentioned. No doubt it would have been very difficult indeed for those countries—at least, so the League Commission found—to have gone on with that particular war without the assistance of the armament firms. That is a different aspect of the thing altogether.

102. Can you take it, then, that the members of your Union are convinced that, so long as the manufacture of arms is deemed a part of national defence, it must for the future be regarded in the light of a national service and not as a legitimate field for profit making?—That is our conviction.

103. As being too dangerous a weapon to be left in the hands of private enterprise?—That is so.

104. Your Union hold the view that to deprive the weapon manufacturer of the incentive to gain is a very important step in the removal of the influences which now divide the nation's conscience?—I think so.

105. You referred to the National Peace Ballot. You have been asking people to make a definite declaration on the question of peace or war—what action and machinery they favour for the purpose of preventing war?—That is so.

106. Is this the significance of the Ballot, that the people have seized upon it as their opportunity to make what they believe to be a real and timely contribution to national security?—I think so.

107. What effect has the National Peace Ballot had upon the Union and its activities? Has it increased or decreased the membership?—There has been an increase of membership.

108. Would you agree that, notwithstanding the enormous success of the Ballot, the political and traditional obstacles in the way of the proposals that you outline are still enormous and less easy to be overcome than the taking of profit out of arms manufacture?—You mean the other questions?

109. Yes?—Well, of course, the first question is support of the League. There is no insuperable difficulty about that. The second question is general

disarmament. We know there are very grave difficulties about that, because we have had experience. The third question is the abolition of air armaments. There are certainly very grave difficulties about that, and it is one of the questions on which there has been relatively more doubt in the answers. The last question, of course, is sanctions, economic and possibly military. No doubt there are difficulties about that, but it fair to observe as to the first question and the last two questions that they are merely saying in effect: Do you approve of the Covenant?

110. You are aware that we are to inquire, if feasible, as to whether it is possible to nationalise this trade?—Yes.

111. Do you hold the view that the matter of arms construction can be solved as a separate problem?—I think I have already answered the Chairman on that matter. In my view it would be a very important element in the solution if you could get a limitation of armaments. That would make it much easier. Whether you proceeded by way of nationalisation or by way of control, it would eventually be a very much easier problem to deal with if you could get an international limitation of armaments. I do not know whether I am answering your question, but I am doing my best.

112. Would not, say, State factories acting only as the finishing instruments collapse as a business proposition in the first hour of crisis?—Do you mean to say the moment war broke out?

113. Yes?—I think it is true to say that all these provisions which aim at disarmament would come to an end when war broke out. The purpose of them is to make it less likely that war would break out, not to control the operations of war once that took place. I have no doubt that every government will do what it thinks is necessary for its own safety once war has broken out.

114. And you think that we can effectively nationalise armament construction without nationalising a large slice of our general industry?—I think so.

115. Now with regard to monopoly. Do you see any insurmountable practical difficulty in the way of State monopoly?—I do not myself.

116. You answered a question put to you by Dame Rachel Crowdy with regard to the drug traffic. Would the arms traffic, by reason of its precision and size, be a simpler proposition to control than the drug traffic?—I think it is fair to say that. I think that is true.

117. Given a State monopoly of manufacture, who is to be the salesman?—The government.

118. While arms continue to be produced, how are those non-producing nations to acquire their requirements under State monopoly, purely national or international?—They would have to buy from governments that produce. At present they buy from private manufacturers, of course; and in the passage I read out in most cases the governments have sufficient influence with their private manufacturers to be able to utilise political pressure in connection with the sale of arms.

119. But I gather from you that there would be less inducement to sell to governments requiring arms?—I think there would.

120. If there were a State monopoly?—I should think there would always be sufficient inducement to sell, but I should not think they would press governments to buy if they were not willing to buy or were not ready to buy.

121. Given a State monopoly, is there any guarantee that there would be less eagerness to sell the commodity as a government product than as a product of private manufacture?—I think there is this difference: that the element of private gain would be largely absent. There would be the desire to make the government arms business a success, no doubt, and the officials connected with it would

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

desire to make it a success and make it pay, but it would not make any difference to them pecuniarily whether it paid or not.

122. I have in mind a reference made by Sir John Simon to a question in the House with regard to diplomatic influence. Would not there be the same eagerness if a nation were a non-producing nation and it wanted armaments?—I think there would, but there would be this difference: that at present the diplomatic influence, whether it is exerted to the very limited extent that Sir John Simon described in this country, or to the more extreme extent that it is in foreign countries, is exercised on behalf of private traders for private gain, rather than with due regard to all the political circumstances of the case which would be present to the mind of any government.

122A. But given a series of State monopolies, would not these foreign governments be seeking orders just as much as private manufacturers?—I think that to some extent they would. It is difficult to speculate. To some extent they would, but their governing motive would be the motive of public policy. That is to say, the question whether they make a profit out of their arms business would be comparatively a small matter to them compared to the very much bigger questions that they would have to take into consideration in dealing with a question of this kind.

123. If we find that nationalisation is not feasible, we are to report on what system of control might be effectively employed. Can you see any way of taking profit out of the construction of arms and still leaving the construction to private manufacturers, even under a system of control?—I think it extremely difficult; indeed, the question almost, if I may say so, answers itself.

124. If there were one salesman, say, and one purchaser in a State, would it matter whether the producer was a private manufacturer or the State?—They might buy from private individuals and sell again. All export would be in the hands of the government. That would be a possible solution. I am afraid I have not thought about it sufficiently to be quite sure whether that would meet all the cases; I should rather doubt whether it would, but it would meet the greater part of them, no doubt.

125. You referred to the American draft proposals, and you say that all your members desire agreement with the United States, and as a first step the adoption and ratification of measures not less effective than those which the American Government have recently proposed. As a first step to what?—What I think was meant was that though, at any rate, a majority of the Executive Committee of the Union would be in favour of nationalisation, yet even they would be prepared to support, as a first step towards the complete control and the complete abolition of the abuses which we fear, the American scheme. I think that is the meaning of "a first step."

126. But you would agree that even the American draft falls far short of the demand of your Ballot?—Yes—taking private profit. It would not take private profit out by itself, but possibly with some such machinery as you have suggested, a central selling board in each country, that might meet it; and, of course, it is quite true that if you combined the American proposals with a complete system of limitation of armaments everywhere, there is no doubt you would get much nearer the abolition of private profit than you would without a limitation of armaments.

127. As far as I gather, even the American proposals fall far short of prohibiting private manufacture?—Oh, certainly.

128. I note also that the Russian delegate to the Conference pointed out that they did not make for even the checking of profits of private manufacturers?—No.

129. And that it was vain to entertain the illusion that the American draft plan would change the situation. Would you agree to that?—I think that

is unduly pessimistic. I think it would be an improvement.

130. I note also that the American draft plan falls very far short of what Mr. Henderson describes in the Labour's Foreign Policy pamphlet, where he says that the Labour Party is determined, if it is returned to power, to take profit out of armaments, and that it will propose the total abolition of the private manufacture of arms and munitions which the members of the League have agreed to in the Covenant. I think it is correct to say that Great Britain does not accept the American draft proposals in their entirety?—Not in their entirety, I gather, but it is difficult to say, because the Committee has been sitting behind closed doors.

131. Can we take it, then, that the opinion of your Union is that whilst arms production is essential to the life of the nation, the time has now passed when it can be trusted to the uncertain and uncontrolled operations of private firms?—Yes.

132. Sir Philip Gibbs: I gathered from your statement this morning that you think that the profit of armament firms is increased by the deterioration of the international conditions?—Yes.

133. Do you think that there has been a rather steady deterioration during the last year, or even the last six months, in international relations?—Yes, I think, broadly speaking, that would be true; but it was because we thought that the situation was developing so dangerously that the Ballot was set in motion a year ago.

134. In view of the fact that you think these conditions have deteriorated, do you think that the possibility of getting an international agreement on this particular subject, the arms traffic, is more difficult now?—Of course that depends. I would be very glad indeed to answer that question, because I have a very strong view, but I am not quite sure that it will not go a little beyond your terms of reference. However, that is not for me to judge. I think that in a sense there has never been so good a chance of dealing with the arms situation as there is now. I think the countries are up against it now, and they have really to do something effective or they will slip down to a situation which must end in war. I think everyone, all over the world, is realising that. So there is a considerable reaction in favour of collective action, collective control, and collective security, and, in fact, something which is indistinguishable from the League of Nations. I think that is true, and it is obvious it must be so, that the moment you have a country which appears to be making preparations for an eventual war, you have got to deal with the situation somehow. In my judgment you will not deal with it by any measure of security by itself, unless you accompany that with measures of disarmament; and, as the Chairman has pointed out, this question of private manufacture is ancillary to disarmament. I think you will have to deal with it. I am sorry to make so long an answer and I hope you will forgive me. To my mind that is the essential part of the situation. We are charging the Germans with breach of treaty. Unquestionably their reply is: Yes, but you are guilty of a breach of your undertakings, which were to reduce armaments roughly on the same lines as we did, and you have failed. Therefore, if you are going to make any effective reply to the Germans, in my view you must make it quite clear that part of your policy is going to be reduction of armaments.

135. And you still think it possible with the state of mind in Europe to-day, with all these fears of hostilities, to get some kind of international agreement on this particular subject?—I should have thought—not perhaps on this particular aspect of it, but on disarmament generally—that, properly handled, the situation was more favourable to an agreement than it had ever been. But you must be courageous; you cannot get anything for nothing; you must be prepared to make your proper contribution to collective security and all the rest of it.

1st May, 1935.]

The Right Hon. VISCOUNT CEZIL OF CHELWOOD, P.C.

[Continued.]

That must be part of your settlement. I admit this is all rather political.

136. It is rather important to know whether we are dealing with a thing which is not from the very outset futile?—Yes.

137. And to know that there is a chance?—In my view there is.

138. That is why I asked you the question. Could you give us any explanation as to why there was a complete failure in carrying out the Convention for the Supervision of the International Traffic in Arms, of 1925, which was ratified by 14 nations. How is it that with the ratification of 14 nations nothing whatever was done to carry that into effect?—I speak from recollection, but I think I am right in saying that the ratifications were conditional on ratifications by certain arms-producing countries.

139. One of them being the United States of America?—Yes, the United States of America.

140. And Italy?—Yes; and that at that stage the United States of America took the view that the Federal Government could not enter into obligations of that kind because that would be to interfere with State rights. I understand that that view is no longer held by those who have been negotiating at Geneva, and that they are prepared now to enter into some very considerable obligations which they at that time thought were *ultra vires* of the Federal Government.

141. And so in view of the change of opinion in the United States you think perhaps that the chances of getting agreement are better now than previously?—Certainly. There is a very strong feeling in the United States on this subject; at least as far as one can judge, there is. It is not for me to say, but my impression is that that general feeling is shared by the President.

142. Do you think there would be any danger in the case of State monopoly of private firms setting up factories in remote and backward countries and operating from those districts?—I think there is a danger. That has happened, of course, in the drug traffic. But it is not so easy to happen, I should think, with regard to such things as armaments as it is with regard to drugs. I do not know. I think it is a possibility, and, therefore, it would be necessary to get as general agreement as you could.

143. Do you think that any rigid system of licensing control could prevent bootlegging and gun-running in arms? I am talking now entirely of a licensing system?—I think a great deal could be done if it is done by a very powerful, effective and uncorrupt government, but I do not think it would be a practicable remedy in the case of a good many governments.

144. I suppose in the case of an international agreement it would be very much easier to prevent?—Yes. Of course in my judgment it would be far easier to enforce a monopoly agreement than a control agreement, but I may be wrong. That is my feeling; that it would be a simpler matter really to enforce monopoly than control.

145. Do you think that private firms as now operating in this trade have a direct incentive to arm a nation which is preparing for an aggressive war?—Yes, I do certainly.

146. Do you think that that incentive is very strong?—It is evidently good business. You have these letters like Jonas's letter. He was afraid that Bolivia and Paraguay were going to settle the matter peacefully. It is obvious that there must be a much greater demand for arms in time of war, or when a war is threatened, than in time of peace.

147. Do you think perhaps it is happening now with regard to countries which seem in public opinion to be aggressive, like Germany, that these manufacturing firms in all countries are touting for orders in Germany?—I should be surprised to hear that they were not, but I do not know anything about it.

148. You do not know anything direct about that?—No.

149. Have you any particular knowledge about our present licensing system?—Not except very generally.

150. Have you studied it at all generally?—Of course I have been a member of the Government and I have seen the working of it—as to whether a licence should or should not be granted, and so on.

151. Do you think it is operated on any particular principle, on any ethical principle, or on any practical principle?—I would much rather you asked someone who could speak positively about it; but my impression is that, generally speaking, it goes almost as a matter of course. If an application for a licence is made it is granted by the Board of Trade as a matter of course. If they have any doubt as to the desirability of granting it, I think they refer the matter to the Foreign Office, and if there is any considerable doubt about it, it goes to the Cabinet. That is my impression, but I would rather you asked someone who knows how the thing is actually worked.

152. Have you personally been aware, at Geneva or elsewhere, of any attempts by financial or industrial interests to bring pressure on yourself or on your colleagues or on the Conference in which you were engaged?—Of course I was there when Shearer was there, and there was unquestionably a most tendentious telegram sent to America by Shearer—all sorts of nonsense about intrigues, by me, among other people, with the Japanese delegate—the suggestion being that we were getting behind the Commission and that the Americans were going to be left in the cart. All that was absolutely invented. There was not even a scintilla of truth in it, except that the Japanese delegate came to have tea with me one day as a matter of ordinary diplomatic courtesy. We could not carry on much of a discussion because he did not talk a word of English and I did not talk a word of Japanese.

153. *Sir Philip Gibbs*: You have not been aware of other cases?—I cannot say that I have been aware of them, but I have an impression, which I must admit I could not substantiate, that the more international negotiations get near to a definite attempt to limit armaments there is an influence, which appears in a variety of little ways, which seems to be hostile to its success.

154. *Professor Gutteridge*: Is that necessarily from the armament makers?—I could not say.

155. It might come from another quarter, might it not?—It might come from any quarter. I may be entirely wrong; I do not want to put this too high; I should not have said it in chief, but as I am asked the question I am bound to reply, and I have the impression that there has always been this kind of atmosphere of difficulty the moment you get near agreement dealing with the question of private manufacture of arms; so long as you are dealing with other questions—the general questions of the League—

156. Soldiers and sailors have rather pronounced views, I believe, on this matter, quite apart from the armament makers?—There are very few questions on which they have not pronounced views.

157. *Sir Philip Gibbs*: Do you draw any strong distinction between State control and nationalisation in your own mind?—I draw the distinction that as I understand State control, you will leave in operation the motive of private profit, whereas if you have nationalisation you get rid of the motive of private profit. It is quite true you might conceivably have so stringent a method of State control that it would eliminate private profit altogether, and then it seems to me it is very doubtful whether you would find that private enterprise would go on.

158. Continue working?—That is so.

159. Do you think that one of the dangers of private manufacture of arms is the constant invention of new types, and that, therefore, it creates

1st May, 1935.]

The Right Hon. Viscount CECIL OF CHELWOOD, P.C.

[Continued.]

competition between nations for the possession of those new types. Do you think that would be eliminated by State control?—No, I do not think it would be eliminated. I think it would be probably diminished. There would be less motive for doing it, but it would certainly go on to some extent. I speak on this matter purely at hazard. I do not know whether I am right, but I should imagine considerable improvements have been developed in the State factories at Woolwich and elsewhere which have been adopted in our armaments and in other armaments. They have not been only the work of private individuals, I should think. But I speak at hazard; I do not know whether it is so or not.

160. It would be a little difficult, of course, under complete nationalisation, because one nation would possess more modern types of weapons and the other nations would not possess them, and if you eliminated private trade in arms then you might create new hostilities and fears among nations, who would know that one nation has a very superior type of weapon which it could not get hold of. Would you think that would be a lesser danger than the present system?—That danger exists now, of course. Take the French '75 gun. That was practically a monopoly of the French, as I understand it, or the French and one or two of their allies. But you know much more about that than I do, Sir Philip. Certainly, at one time some of the torpedoes were monopolies of the British Admiralty. The Whitehead torpedo originally was the monopoly of the British Admiralty, and so on. On occasions, the government to which the invention is sold makes it a condition that they shall not sell it to anyone else, and in that case you get the monopoly. But in point of fact I believe I am right in saying that those secrets are almost always discovered rapidly and become public property, and once they are discovered, of course, other countries begin to manufacture either exactly the same thing or something of the same kind.

161. I gather your greatest hostility to private manufacture is that owing to the profit making system the more strained international conditions are the better it is for trade, and that if you can eliminate that profit, you eliminate also the incentive to keep those conditions strained?—That is it.

162. That I imagine is one of your strongest arguments?—Certainly.

163. Would it be fair to say that you would go so far as to say that the private traffic in arms is one of the actual causes of war?—Yes. A predisposing cause is the way I should put it, rather than a proximate cause; and I think it is undoubtedly an obstacle to efforts to peace in the way you have been alluding to in the questions you have put to me.

164. *Dame Rachel Crowley*: When I was in Washington a month ago I talked over with members of the Nye Committee what they called the armament ring. They told me that the fact that manufacturer A. could not export because of trade regulations, or whatever it might be, from this country to the scene of war, they would pass on the contract to manufacturer B. in another country, where the laws were less stiff, and they would get a commission on the export from country B. Do you know anything about that at all?—I only know of the evidence which has been given before the Nye Committee. There is evidence of letters of this kind. "We have, of course, heard from several sources that Bolivia wants A.A. guns quickly, but we do not think for a moment that a shipment or sale to Bolivia could be made direct, while that country is at war. If, however, an American armament firm of some standing bought the guns, for eventual resale, things might be easier—or if the Colombian Government, who are not at war, bought the guns, they could no doubt have them. We are investigating the question with the War Office here regarding a direct supply to Bolivia through yourselves, and will inform you of the results as soon as we can, but in principle we are not so hopeful of permission being

given. In any case, we do not think there are many A.A. guns apart from ours to be got from stock and quickly, so your chance of selling new guns with a few months delay may be increased if we cannot supply, or if we refuse to supply, should we be allowed to do so. We shall promptly advise you of any new developments on this subject."

165. That does not absolutely refer to the point that I was on?—No, not quite.

166. The point of the Nye Committee was that manufacturer A., having handed on the order, took a large commission, having himself been forbidden by his government to export to that particular warring country, and I was going to ask you if you have any idea, supposing the monopoly is introduced into this country and there is control of private manufacture, of any way of which a ring of that type could be made non-effective?—I think it is all very difficult, but theoretically I suppose it is possible to make it a condition of the licence that the goods are only to be sold to a government. That would be, I suppose, one of the conditions, and then it would have to go to the government direct. It would still be possible, as these people suggest here, to sell to the Colombian Government, who would pass it on to the Bolivian Government. I should hesitate myself to think that any system of control would be so effective as to make it impossible to get round it. Indeed that is my principal doubt about the system of control.

167. Would you think the best method would be an import certificate system issued by a responsible government?—I think you will be able to tell me, but I think that is the system in force with regard to drugs?

168. Yes, it is; but I wondered whether you consider that would be any solution?—I think that is the best way of dealing with the difficulty. It is a form of government monopoly though it is not actually complete nationalisation.

169. In which case presumably our Board of Trade would not give a permit to export unless the exporter from this country had an import certificate licence signed by the foreign government?—It would have to be something of that kind.

170. *Chairman*: With regard to the position in the event of there being a State monopoly, as you have pointed out, or as you said in answer to a question, the only source from which a non-manufacturing nation could obtain arms would be from a manufacturing nation. Assume the case where a manufacturing nation refused to sell to a particular State for political reasons; that State would then have to apply to another government. Do you think that if the other government complied with that request, it would be considered as an unfriendly act by the government that had refused to supply the arms?—It depends on the circumstances, of course. If it was with a view to attacking the first government there might be difficulties, but I should not have thought so. What is said in that passage which I read out is that at the present time in a great number of countries a government will intervene if they have strong political reasons for preventing a sale by their nationals, even private manufacturers, to a particular government. They will intervene to prevent it, and according to these people who spoke for certain governments they do not think that the difficulty of the non-manufacturing governments would be any greater under a system of government monopoly than it is at the present time.

171. I want to call your attention to your pamphlet, No. 359. There is a very striking passage on pages 15 and 16. It is rather a long passage, but if you will turn to page 16, about half way down you will find this: "Only when the peoples as a whole accept as a reality the renunciation of war as an instrument of national policy, and look upon their national forces principally as a means of maintaining order within their territories and of

* Appendix: Annexe, Note C, item 20.

1st May, 1935.]

The Right Hon. VISCOUNT CECIL OF CHELWOOD, P.C.

[Continued.]

co-operating with other nations to defend international order, will the system of international supervision have a good chance of success".—I agree with all that. I have not the least doubt that the best remedy is to get rid of war.

172. It goes a little further than that because it says until you get a better feeling amongst nations, a better spirit amongst nations, there is no chance of doing anything. In substance, that is what it says, is it not?—I should agree, broadly speaking, with that as a proposition, which you have quoted, that no arrangements for the bettering of international life will permanently succeed until you get rid of this conception that each nation is seeking to attack another nation; but I think you can do something. The passage in question relates only to international supervision; it is not at this moment

dealing with the question of national monopoly. I ought however to call your attention to the rest of that paragraph which you read, and particularly to the last sentence: "It is, however, contended that measures designed for the curbing or repression of commercial interests, which profit by the manufacture and sale of implements of war, and which at present exercise a very powerful influence upon sections of public opinion, will in themselves contribute to the required enlightenment of the public conscience in all civilised nations".

173. I did not mean to conceal that.—No, I am sure you did not, but that really states what I was trying to say.

174. *Chairman*: We are very much obliged to you, Lord Cecil, for your evidence.

(*The Witness withdrew.*)

Miss K. D. COURTNEY, called and examined.

175. *Chairman*: I believe you are a Member of the Executive Committee of the League of Nations Union, you were formerly President of the Women's International League and you attended the Disarmament Conference as observer of the Women's International Disarmament Committee of the Women's International Organisations, 1932-1934. Is that correct?—Yes.

176. You are prepared, as I understand it, to make a statement to us supplemental to what Lord Cecil has said?—Yes. I should like, if I may, to say something about the American proposals of 1935—those which are now before the Disarmament Conference. I should like just to remind you of the origin of those proposals. They were first made when there were prospects of at least an armaments limitation convention being agreed to and were accordingly made to fit into a limitation convention. When it became obvious that no convention was likely to be agreed, even a limitation convention, the character of those articles was changed and the centre of gravity, if I may call it so, was altered and their whole weight depended upon publicity. Without limitation obviously you are dealing with a kind of bottomless sink; manufacturers can go on making armaments to any extent. You have to have some kind of criterion, and failing limitation the criterion became publicity; and so publicity is really the keyword to the whole of the American draft proposals.

As you know, the essential idea is one of control, national and international, and the draft convention is not an alternative to nationalisation because the control set forth in the American proposals could be exercised, and indeed would be exercised, over States which have a State monopoly, such as Russia, just as much as over States which have private manufacture, like our own and most other States. Consequently we must not regard it as an alternative to monopoly; it would operate whether or not there were a State monopoly because it provides that every government shall assume responsibility for the manufacture of armaments within its territory. Consequently every country would be free under the American proposals, were they accepted, to set up a system of nationalisation, if it wished, without affecting the American scheme in the least. As far as the American draft convention is concerned it makes each government responsible for the manufacture of arms within its own territory. It further proposes (and these are two highly important matters, because they have been raised several times in the course of the discussion this morning and this afternoon), to equalise the situation as between producing and non-producing States, and to equalise the position as regards State manufacture and private manufacture. In regard to State monopoly it may be noted that although per-

haps Russia is the only country in which the manufacture of armaments is nationalised, the possession of arms and the whole question of armaments is a State monopoly in those countries which are not producing States, because the only body which can own armaments on a large scale is the State; consequently in such countries armaments are already a State monopoly. International control is set up by the American proposals not only over private manufacture but also over State manufacture, thus eliminating some of the difficulties which have been raised this morning and this afternoon; and this control, this equalisation, is arrived at really by means of publicity.

The Americans propose to set up a system of licences, a very strict system of licences, both export and import licences, so that any armament manufactured could be traced through its whole life, from its start, where it was made, to, finally, where it ended up in the possession of a State. Further, there are to be licences for the manufacture as well as for export and import of armaments—that is a new proposal. In this country we have licences for export, and so have a few other countries, but none has licences for import; and, of course, no system exists of licences for manufacture. The draft convention sets up licences for manufacture; it makes provision for a very complete system of publicity, by which there would be publicity before manufacture, publicity, by weight, by value, by number and by categories.

It further provides for inspection on the spot—not merely the verification of documents, but inspection, by an international commission, of factories which are licensed to make armaments. It was suggested this morning that such a system might produce friction. I would suggest that the alternative system proposed would produce more friction; the system by which inspection on the spot would only take place in the event of a complaint having been lodged. For instance, all of us are subject to a customs examination and we accept it as ordinary routine. If our luggage were only examined because someone said that we were carrying contraband, I think that would create friction very much more than the present system; we should want to get our own back on the person who had denounced us, and that would be the kind of friction set up under the alternative system. However, I will come back to that in one moment.

I want now to dwell for a second on the question of the categories, enumerating the armaments to be controlled. The American proposals set up a very valuable list of categories of armaments, defining, in short, what armaments are. That definition has

1st May, 1935.]

Miss K. D. COURTNEY.

[Continued.]

two values, one inasmuch as it is a definition, and secondly inasmuch as it provides for varying degrees of inspection, licences and publicity, according to the character of the armaments enumerated, whether wholly military, partly military, or not military at all, such as weapons intended for sport. On that question it is interesting to note that the air weapon has been very carefully defined. The British Government raised the question, at an early public meeting of the Committee at Geneva, of the importance of bringing civil aviation under very strict control—civil aeroplanes and parts of machines—and as a result of the discussion certain kinds of aeroplanes and certain parts of aeroplanes are put into the categories which get the most supervision. Perhaps it is worth while calling attention to the fact that the criterion agreed upon for military aircraft lies in its equipment with special guns, machine guns, and their mounts and frames, the theory of course being that they cannot be used for military purposes without some equipment of this kind. The fact also that the special guns with their mounts and frames, the bomb racks and release mechanisms are put into Category III makes them subject to the strictest form of supervision. This means that they cannot be bought or sold without both import and export licences, nor can they be manufactured and stocked in reserve without the fullest publicity, if the American text for manufacture is adopted. I venture to call your attention to that because, on a side line, it is a way of bringing civil aviation under some kind of control and supervision.

The British Government, as you know, has objected to the kind of publicity proposed in the Convention, and it has objected to the plans for inspection on the spot. In the last speech of the British representative he referred to the fact that people had been spoken of as maximalists and minimalists, and he declared himself a maximalist because he was supporting the form of Convention which he believed would receive the greatest amount of support. But upon looking at the list of supporters of his proposal I find it consists of Great Britain, Italy, Japan, with Poland rather doubtful, whereas all the other States supported the fullest amount of publicity and inspection, and it seems odd—I do not quite understand; I speak in ignorance—that Great Britain should suppose the greatest amount of agreement would be obtained for the proposition which had the smallest amount of support, because that is actually the case—only three countries, with a doubtful fourth, supported the proposal which our representative declared had the greatest probability of general acceptance.

177. *Sir Kenneth Lee*: What countries were absent?—I do not know what countries were absent at the last meeting but the other countries on the Commission were the United States of America, France, Czechoslovakia, Spain, Sweden, Switzerland, Canada, China, Belgium, Turkey, Denmark, Russia, Italy, Poland, Japan, South Africa, Lithuania, Mexico, Persia, Afghanistan and Venezuela.

178. *Professor Gutteridge*: Were there any reservations?—There have been a very large number of reservations.

179. The reservations simply have the effect of knocking a hole through the whole thing have they not?—I do not know that you could say that. We believe that agreement could be reached if the two really outstanding difficulties of publicity and inspection were overcome.

I should like to make two further observations, one on the question of so-called neutrality if it could ever be said to exist under the League of Nations. The report is accompanied, as you no doubt know, by a very detailed report of the committee of jurists which dealt with the whole question of derogations from the Convention, and with what would happen in the case of war. I will not

venture to comment on it, because I am quite incompetent to do so, and no doubt you have it before you.

I should like also to make one other comment. A question was raised in the early part of this afternoon with regard to the habit of governments of making loans to non-producing countries with the idea that the countries would use those loans to buy armaments from the producing countries making the loans. The British delegation, when this matter was being discussed, did make a proposal, which I do not think has been followed up, that the convention should deal with this very question of loans; but as far as I have been able to see, looking through the text which has emerged from first reading, that subject has been omitted. I should like to call attention to the fact that the text you have in your hands emerged from first reading materially altered, though the substance I do not think has been changed. Those are all the remarks I desire to make on this subject, I think.

180. *Chairman*: What is the position of the discussion upon the American proposals now? Is the matter adjourned?—The end of the first reading has been reached, and it has been adjourned; I do not think any date has yet been fixed for the second reading.

181. From your observations there appear to be only two main questions which are left in dispute: publicity and inspection on the spot. Is that so?—No, I should not say that. There are a whole lot of other points which have been reserved, the decision on which depended upon a decision upon other points. Those were the two big outstanding questions. A large number of other questions were reserved.

182. *Dame Rachel Crowley*: You said something at the opening of your speech, when you were explaining to us the various articles of the American draft convention, and you said publicity was required before manufacture. I think that is what you said, and I did not quite understand what it meant. You said it required not only publicity but publicity before manufacture. Do you mean that the parties to the convention would have to send in estimates of their requirements for the coming year?—No, I meant publicity for orders; that any order received by a firm would have to be reported at once to its government and by its government to the international commission at Geneva.

183. Before it was fulfilled?—Yes within thirty days of reception of the order, I think it is.

184. I think you said something about the Union regretting any amendment to the American draft convention which would lessen its effectiveness—that any amendment of the draft proposed by the British delegate at Geneva would, in your view, make the American draft convention ineffective, or less effective?—I think the amendments we had in mind in making that statement were amendments relating to reducing the quality and character of publicity, and to the question of inspection on the spot. I think those were the two specific matters which we had in our mind which we believed would make the draft convention ineffective because they would probably make it unacceptable to other countries.

185. *Mr. Spender*: Are the British proposals being pressed, or merely put down as a contribution to debate which could be modified as they went forward?—Do you mean the amendments of the British Government?

186. Yes?—They were pressed. They are put down under the first reading as alternative proposals supported by the British Government, by Italy and Japan, and some of them by Poland.

187. The matter is still under discussion?—Yes.

188. There has been nothing final?—No. It is simply the first reading text which we have before us now.

189. *Dame Rachel Crowley*: Have the Americans suggested in any way a compromise from the draft convention which they are putting forward—any

1st May, 1935.]

Miss K. D. COURTNEY.

[Continued.]

suggestion which might meet the points of view of Japan, Italy, and ourselves?—The first reading text is in itself a compromise; it is the result of discussions that have taken place over a period of nine weeks, mainly in private, and I think that as it emerges it no doubt is capable of further alterations. But the articles as they now appear are not the articles as they were put forward by the Americans; they have been a good deal changed already in various ways.

190. *Professor Gutteridge*: As a matter of fact, there has been—I am not concerned at the moment with the proportions—considerable division of opinion on this Committee?—We imagine so. The whole thing has been conducted in private, so we only know what we are able to obtain from the reports which have been issued.

191. I am speaking from memory, but I have a recollection that the Polish and Swedish delegates at an early stage of the proceedings urged the Committee to refrain from trying to aim at too much, but to try and get something on which there would be general agreement. Is not that so?—I do not know. That has all happened in private. They certainly did not do so while the proceedings were in public.

192. Do not you agree that it would be better to do something which will secure universal agreement than to aim at something which will merely result in nothing?—I should say so, yes, if I knew what the universal agreement was going to be.

193. I will tell you what I have in mind. You know the Geneva Protocol against chemical warfare, do you not?—Yes.

194. That was agreed to in 1925, was it not?—Yes.

195. Nothing has ever been done with regard to that, has it?—Well, it is supposed to be in operation, I think.

196. Are you sure?—The reason why it does not work, if you remember, is—

197. They cannot define the appliances?—I think the reason is that it permits the use of chemical warfare by any State against whom it is used, and this means that the whole business of invention and experiment is kept going.

198. *Professor Gutteridge*: It is not very much good.

199. *Mr. Spender*: Was not the prohibition very much earlier; was not it laid down at the Hague Conference in 1907?

200. *Professor Gutteridge*: That is so; but the matter was revived again after the War. My only point is this: There you get a definite thing agreed to at Geneva, and then nothing comes of it; and that is why I was suggesting that if we can get something which is really going to be agreed to and really is going to function, is it not better to try for that than to try and aim at something which will come to nothing? You are familiar with Geneva, I think, are you not?—*Miss Courtney*: I have been there pretty often.

201. Is it not a fact that at Geneva countries very often sign and then do not ratify?—It has happened with a good many countries, I think.

202. Is not that one of the difficulties of working the Geneva system, that you cannot be sure that if people sign they will carry it out?—I suppose it is a difficulty of any system in which delegates are authorised to sign, but must refer to Governments for ratification.

203. With regard to inspection *en place*—on the spot—I should have thought there are certain practical difficulties there, are there not?—I think there are a great many practical difficulties.

204. I am not referring merely to any possibility of friction or anything of that kind. What I mean is this: If the people who are being inspected are playing the game, if they are being honest, then you will probably find out what is going on; but if they are being dishonest and not carrying out the agreement you probably will not find out what is going on?—I should think that is very likely.

205. I am not convinced of the efficacy of it. Do you really think it is more efficacious than a system of national inspection together with verification at Geneva?—I have not really got the knowledge to be able to reply "Yes" or "No" to that question; but certainly the opinion of the majority of the Conference is that it would be more effective. A number of persons who are quite entitled to think so would not accept a convention unless it provided for inspection on the spot, because they do not believe—

206. You say some countries go as far as that?—I think so, yes.

207. They will not have it unless there is inspection on the spot?—I think that is France's attitude.

208. And there are some countries which will not have it if there is inspection on the spot?—Yes, Great Britain, Italy, Japan and probably Poland.

209. Do not you think there would be a certain amount of uneasiness in this country if emissaries from Germany at the present time were able to enter our dockyards and see what was going on there?—Not if we were able to enter theirs on the same terms, I think.

210. If we were able to?—We should be, because the inspection would be international.

211. I am not quite so sure about that as you seem to be. It seems to me that one difficulty is that you may get one country giving facilities to another and then not receiving facilities in return. I am afraid I have not got the belief that you have.—If the country in question did not afford the facilities the convention would be broken and the matter would have to come before the Council of the League.

212. What do you suggest would be done then?—I do not think I could go into the mind of the Council.

213. Perhaps I might ask you one more question. Are you familiar with the working of the Drug Convention?—I know it in general.

214. I think that has been successful, has it not?—I do not know to what extent it has been successful, but you have a member on the Commission who does know.

215. I wondered whether you had studied the matter?—I only know about it in a very general way. It has occurred to me that it would be far easier to control arms than drugs, because arms are so much bigger than drugs.

* 216. If the control of drugs has been a success, you think the control in the case of armaments has more chance of being successful because it is a larger article?—I think so; because you could not smuggle arms as easily as drugs.

217. *Sir Thomas Allen*: These American draft proposals were designed as part of the groundwork of the general Disarmament Conference, were they not?—They were originally so designed, but when it became obvious that no convention was likely to be agreed within a reasonable period of time, they were proposed as a separate convention to stand by itself.

218. I understand that the British Government agreed on all points with the American draft except one referring to proposals for international inspection?—In addition to inspection there was the question of publicity on which they were not agreed.

219. Do you think that each country could be relied on to make honest returns?—I should not like to dispute any country's honesty.

220. You are aware that Sir John Simon in the House of Commons said that verification by a committee at Geneva was to be preferred?—He said so, yes. That is the British position.

221. *Sir Philip Gibbs*: Is an agreement on this convention dependent upon the re-entry of Germany into the League of Nations?—I do not think it has been made dependent upon it.

222. It seems to me it would be extraordinarily awkward to work if Germany were outside the convention?—Yes, I think it would be.

1st May, 1935.]

Miss K. D. COURTNEY.

[Continued.]

223. You have no knowledge yourself as to the German attitude on this subject?—No, I have not. I have no doubt that some of the countries have, because they have kept in touch with the German representatives.

224. Do you happen to know, for instance, whether France would ratify this convention without the re-entry of Germany?—I do not know.

225. There has not been any discussion on that subject, as far as you know?—Not as far as I know; and, as has been repeatedly said, unfortunately all the discussions have taken place in private.

226. How is it that Japan is acting on this convention; she seems to be taking part in this?—Japan left the League, but she did not resign her membership of the Disarmament Conference, and it is in that capacity that she is represented.

227. Is there any chance of Japan withdrawing from this particular convention when the period arrives when she withdraws entirely from the League of Nations?—I think that if she signed the Convention—(the period of her withdrawal from the League has expired)—she would stick to it, no doubt, until such time as she withdrew her signature or it expired.

228. Do you know whether there are any other nations which would abstain from this particular

(The Witness withdrew.)

Colonel DAVID CARNEGIE, C.B.E., J.P., called and examined.

232. *Chairman:* You are prepared, Colonel Carnegie, I understand, to give us your views on some points not already touched on?—Yes.

233. Would you prefer to make a statement?—Perhaps I might just say a few words to begin, and then perhaps questions could be asked of me. I am concerned with national boards in particular. First, may I say that I agree with all that Lord Cecil has said this morning about the dangers arising from the uncontrolled arms industry. As you know, the proposals that have been made to remove the dangers are two, control on the one hand, and abolition on the other, of the arms industry and the private manufacture of arms. A great deal of discussion took place at Geneva over the two remedies during the time I was a member of the Temporary Mixed Commission, and I then shared with Lord Cecil in supporting that majority report to which he referred this morning. At that time we had in view the difficulties which are set forth in the documents that have been presented to the Commission, and reached the conclusion that a form of State control or licence, under all circumstances, would be more likely to remove the evils referred to in the Covenant than the total abolition of private manufacture. The nature of the control with which we then dealt was merely licensing, and, as Lord Cecil pointed out this morning, it included a good many restrictions upon private manufacture.

Since then I think we have moved forward, and, in the reports which have been handed in—the reports published in the Unions Pamphlets Nos. 347 and 359—we have there set down the arguments; we have repeated the arguments which were advanced at Geneva, and also arguments that have grown around the subject since then, and have reached the conclusion that the nationalisation of the arms industry—and what I mean by nationalisation is this: I mean the full nationalisation of the arms industry embodying all that is employed in manufacture—would entail the complete State ownership of all industries, which, as far as our Committee agreed, was not desirable at the moment. We therefore thought that the means of control which were more likely to be effective in removing the evils were to be found in a system by which a government would place into the hands of a public authority the control of the manufacture, sale, and distribution of arms, not only for a home government but for any foreign government requiring arms from the country manufacturing them; and so there is set out in the reports before you

convention?—I do not think it is possible to say that. This convention has been elaborately studied by a committee which consists of certain nations, and I should imagine that if the countries which are on the Commission accepted it the other countries would do so also.

229. Do you know whether France is satisfied with the American proposals, or does she want to make them rather more stringent?—I think France is satisfied with the first reading, with certain reservations which she has made on the first reading. The American proposals have been considerably altered during these nine weeks, and the French delegate has put in certain comments.

230. *Chairman:* We are much obliged to you, Miss Courtney.—May I just say this? We do not know what the German position would be, but the Germans have always said that they would accept any form of supervision or inspection that other countries were willing to accept.

231. *Sir Philip Gibbs:* How long ago did they say that?—*Miss Courtney:* Hitler said that again quite recently. At the same time he said they would do away with any armaments which other countries would abolish.

the idea of national armaments boards, the object being to give to the public authority the right to control the arms industry in the country, not only private industry but also the State factories producing arms. That control would eliminate entirely what I, personally, consider to be the greatest evil in connection with the private manufacture of arms. That is the power that is left in the hands of the private manufacturer to go to A, B and C countries and solicit orders without any restrictions whatever being placed upon them, and at the same time using all kinds of propaganda—which are well known to you—which have led to very serious abuses and the dangers which we have heard referred to already.

The board would be the sole channel through which all orders from the home government or from foreign governments would pass. The private manufacturer would be prohibited from going outside his own country or even approaching the national board in his own country for any orders from foreign nations; he would be restricted to a licence granted by the national board for any measure of work required by him in aid of the manufacture of a weapon. Further, one of the other functions of the national board would be to place with the government factories orders for the completed weapons. The national board would have no authority whatever to determine policy; it would exercise no right to say what arms might be required by a nation; that would be simply the policy of the government; but its business would be, once that policy was determined and the measure of arms required by a nation was settled, to obtain results, and it would obtain them in a definite way. First, it would place the order for the completed weapon in the hands of a government establishment. The government establishment being unable, perhaps, under present conditions, to supply the component parts of the weapon necessary for the completion of the weapon, it would request the national board to supply either the raw materials or the semi-manufactured materials in aid of the completed weapon for which it held the order. Then the national board would licence A, B, C or D manufacturers to produce those component parts in aid of the completed weapon, but in no circumstances, according to our proposals, would the private manufacturer be entitled or given the right to produce the final weapon. Thus, the existence of such a body, it is believed, would remove that incentive to profit which the arms manufacturer in his freedom to secure orders has, and in consequence of which he is tempted to use methods which are not often

1st May, 1935.]

Colonel DAVID CARNEGIE, C.B.E., J.P.

[Continued.]

considered proper. Further, with reference to the question of the supply of arms for foreign nations the procedure as outlined here would be very much the same. That is, the foreign nations, knowing through a central authority what capacity a country had to produce the arms, would apply to that country through the national board for the supply of arms. The national board then would exercise the same function of ordering the completed arm through the national factories, and, in turn, the component parts which could not be made by the government factory through private manufacturers. Generally speaking, that would be roughly their function. As to the nature of that body, one of the reasons why it has been suggested is this: that it could be composed as a body free from military control or political control. It might be considered somewhat on parallel lines with the body which was set up under the Dangerous Drugs Convention two or three years ago at Geneva, but it would, while only being a human instrument, have more liberty of action which would give it the right to secure the munitions required by the home and foreign governments without the dangers that now exist from the private manufacturers soliciting orders from foreign countries.

The question of inspection has been referred to. Of course, that would be part of the work, and while there are difficulties in connection with inspection, they are not by any means insuperable. As to national inspection, if I may say so, I found no difficulty whatever in getting even a fairly satisfactory inspection in the case of munitions during the War in Canada while I was a member of the Imperial Munitions Board there, and had no difficulty in arranging contracts for the supply of munitions by Canadians to the United States through our Imperial Munitions Board, and proper inspection without more than the ordinary irksome things that arise.

234. *Chairman*: Was this during the War?—Yes.

235. But, of course, very different considerations existed than would exist in peace-time?—Certainly.

236. Everyone was willing to help during the War; everyone might not be so willing to help in peace-time?—Yes. If I may refer to the question of inspection now, the inspection of arms now made either in government factories or in private establishments is all done according to specification; the inspectors have their specifications for the supply of munitions; so that the difficulties which have been raised as to the question of the inspection of materials—

237. Has anyone suggested that there is a difficulty in inspection, assuming the inspector is one of your own nationals?—No. I am coming to the question of international inspection; I am referring now to the question of national inspection. International inspection would be quite another matter. I quite agree about the difficulties which might arise where suspicion arises, but it is not an uncommon thing for inspectors from a foreign country to come over to Britain to the various yards, or the various private establishments, to inspect and test and pass the materials made there; that is the foreigners who come over for the purpose of passing their own materials.

238. They come by invitation more or less?—They come in order to see that the work which has been ordered by their governments has been made to the specifications supplied.

239. *Sir Thomas Allen*: That is an inspection of their own work?—Yes; but the other inspection, which is the troublesome inspection, is where there is any doubt of a nation fulfilling its bargain under any treaty arrangements, where inspectors are supposed to come over and inspect facilities and the kind of work done. That is another matter and quite a serious matter, but that does not come into the range of functions of this particular national board. I see the possibility of setting up such an

organisation as this even in our own country, without similar powers in other countries, although that would be a better arrangement; but I see the possibility of such a board functioning and thus preventing the evils arising from the freedom of private manufacturers at the moment in our own country. That is all I have to say.

240. *Chairman*: In substance, what you have outlined is all contained in this pamphlet, is it not?—The two pamphlets.

241. Yes; but generally in No. 359?—Yes.

242. *Professor Gutteridge*: I think it is No. 347 which has most in it, is it not?—Yes. No. 359 embodies what is not embodied in No. 347; that is, the manufacture of the completed article by governments.

243. *Chairman*: I think that all you wish to say is plainly set out in these two pamphlets as I see them; but are you assuming that an effective purpose would be gained by unilateral action by one nation, or are you assuming that to make your suggestion effective it must be international?—It would be international, but my assumption is that it would function unilaterally.

244. It would function, of course, but would it function usefully?—I think so.

245. Would it advance other than the moral side of the question?—It would certainly be moral, but I think practical. That is my own feeling from some experience of such boards.

246. It would not reduce the number of available arms if you cut one country off without cutting all the others off?—No, it would not; but its function would not be to limit arms at all; only to make arms determined by the government. The board would simply be the authority to manufacture and to issue export licences for what was manufactured.

247. Would you be prepared to allow under your system the exportation of arms made in this country to the extent to which exports exist now?—No. I am not concerned at the moment about measure; I am concerned about the principle of the organisation that we are considering. Supposing the British Government orders x arms, this national board would only be responsible for the production of x arms.

248. Yes; but supposing the Government continued its present policy—I do not know exactly what the policy may be, but it is said that they grant licences almost automatically now—supposing they continued that policy, even under your system that would be possible, and there would be exactly the same amount of arms exported, only they would be produced under different conditions?—Yes, that is so; but under the proposed system the export licences would be issued only from the one authority, that board whose knowledge would be purely that of a particular industry. The licences at the moment are issued through the Board of Trade, which is dealing with all kinds of materials—not that I am suggesting they do not know what they are doing, not at all—but here is a board dealing with a particular industry, a board which is set up to watch the abuses which have been alleged, and it would be their business to see that no licences were issued for the export of any materials that were not right.

249. But, then, I do not quite follow. Why should not the board have the same policy as our present Government has, or any existing government?—There is no reason why the board set up should not have the same authority to issue licences, just as, say, the Board of Trade issue licences to-day. But what I am trying to emphasise is this: Here is a board set up to control the arms industry, not to control all industries; its functions will be to watch that the materials that are exported are the materials that the board has ordered. The Board of Trade do not handle the orders.

250. No; but supposing the board were to think that the more arms we export the better; your system would not improve matters at all, would it?—That is rather an impossible thought, is it not?

1st May, 1935.]

Colonel DAVID CARNEGIE, C.B.E., J.P.

[Continued.]

251. Well, I do not know.—I should suggest it is, with due respect to you, Sir. I think it is not likely that any board set up with the object of removing abuses would encourage the multiplication of arms instead of trying to reduce them. If I might emphasise just one point which Dr. Garnett has mentioned to me, it is this—I have said so before—the chief difficulty that I see at the moment in the freedom of private manufacturers is in their power to solicit orders.

252. *Professor Gutteridge*: Touting?—Yes. The board would stop that entirely; they would be prohibited entirely from touting because they would not be permitted to take any orders except through the one source, the national board, and they would be prohibited, in peace-time at least, from the manufacture of any completed weapons.

253. *Sir Thomas Allen*: Why could not all this be done by a national authority?—I distinguish very greatly between State ownership and control by a public authority. The public authority would have nothing whatever to do with the finance of the factories; their business would be simply to see that the orders were completed, that they were passed to the government factories, and they would arrange also for the inspection in the way that is mentioned in the report, but they would not own the factories. It goes to the broad question of national ownership, and the difficulties arising from that are so many that it is unnecessary for me to go into them now, as they are known to you.

254. *Professor Gutteridge*: You put this forward as a really permanent scheme, I take it?—Yes.

255. As I understand it, your view is that it gets rid of all these abuses connected with soliciting orders in South American republics, and that sort of thing; and not only that, but it affords something which can be brought into operation at once?—Yes.

256. It can be brought into operation unilaterally if necessary?—Yes.

257. And it avoids all these complications of deciding what parts of the national industry shall be nationalised?—Yes.

258. I am rather interested in this matter. Are you the author of this scheme?—I should not like to say that I am the author, but I proposed the scheme and submitted details of same in a memorandum to the National Executive Committee of the League of Nations Union. Some modifications were made by the Committee of the Union and the scheme was finally embodied in the reports which have been handed in.

259. My reason for asking you is this. Have you ever considered the working out of the administrative details of this question?—I have, yes.

260. For instance, have you formed any idea as to what the composition of the board would be?—I have in my own mind.

261. How many members would you suggest?—If I may say so—it is only a suggestion—I think there ought to be about 12 members. There ought to be a financial member; there ought to be a legal member; there ought to be a commercial member; there ought to be an engineer, and so on. You see what I mean?

262. Yes, I see what you are after.—A board which will envisage the industry as a whole and deal with it.

263. They will be full-time paid members?—Certainly.

264. Something like the Electricity Board?—Yes.

265. What is puzzling me a little is this: What would be the relation of that board to the present buying departments of the Services? You have been a soldier, have you not?—Yes.

266. You know the sort of arrangements which are made?—I have been on ordnance work.

267. So have I; I have been an ordnance man, too.—That is my work. If this board were carried out on the lines suggested in our report we should bring under control the Air Ministry and the War Office.

268. Take them over?—Yes, so far as they were affected. We would take over the inspection departments in so far as they were affected, and pass on to them that authority that you would pass on to your buying department or your ordering department and the like, and also pass over to the inspection department the details necessary for the examination of the work.

269. May I put it to you in this way: Supposing the Government want to reinforce the artillery in India and they decide they want to have an additional eight mountain batteries—shall we say eight quick-firing mountain batteries—could you give me an idea of how that would work in this case?—Yes. The order would come through the M.G.O. or through the War Office. It would come to the national board; it would then go—you are speaking of mountain guns—to, say, Woolwich Arsenal, and they would quote for it. The board would receive the quotation and say "O.K." or not. Naturally there would be certain component parts which Woolwich could not manufacture, and they would immediately send back to the national board: "We require certain components for these mountain batteries," and then the board would go to A, B or C private manufacturers and they would licence them to produce the component parts. Those component parts would be inspected by the inspection department of the board; they would go back to Woolwich and be assembled at Woolwich.

270. You said that the order would go to Woolwich, but there is no reason, I take it, why it should not go somewhere else?—Not necessarily.

271. There is no reason why it should not go to a State factory, or, if a private firm were better fitted to carry it out, it would go to them?—No; I am not suggesting that.

272. That is what I want to know.—I am suggesting that if it goes to a private factory that private factory shall be State owned. For instance, supposing it were found that we could not extend Woolwich to deal with the particular order, we would look around and say: "Well, there are certain private armament firms that are capable of producing these things." That factory would either be taken over entirely as a State owned factory for the final completion of the work and become part of the State establishments, or—

273. In other words, take a certain type of submarine which can only be built at Vickers? As you know, there are certain types?—Yes.

274. Would you take over Vickers?—Yes.

275. Why should not it be sufficient if you order the submarine from Vickers?—The reason why is that if we admit the principle of the final manufacture of a submarine by Vickers, why should we refuse them the right to make submarines for A, B and C foreign countries?

276. Take the Bolivians—they will not do because they have no seaboard—but take the Peruvians; supposing they want submarines, why should not they come to the board and say: "We understand that Vickers make excellent submarines; we would like one of them; we cannot approach Vickers direct, but can you get one for us?" Why should not that be done?—I see one reason.

277. There would be no soliciting or touting there?—That is just what I am going to say. There might be. It might be that the knowledge of Peru requiring submarines would put Vickers' people on their track, and that would suggest to them that the name of Vickers should be used in the application to the national board, that they should receive the order, and certain moneys might be passed over.

278. I see what you mean.—That is a possibility. You are speaking of submarines; I am thinking of other things.

279. Yes—rifles and explosives. There are certain private firms which make rifles?—Yes.

280. The B.S.A. Company and Enfields, and so on. You might get this type of case, where 10,000 rifles

1st May, 1935.]

Colonel DAVID CARNEGIE, C.B.E., J.P.

[Continued.]

would be ordered from the board and it might be left to the board to place that out between Enfields and the B.S.A.—Yes.

281. There would be no difficulty there in a case of that kind, because nothing would be suggested to the board; the board would control the matter absolutely?—Yes; but I am suggesting that all the finished weapons should be made in State owned factories.

282. That is what I was trying to get at. Your scheme is really a combination—?—Of nationalisation and control of the arms industry.

283. Might I call it the last stage of nationalisation?—Yes; because I personally from the experience that I have had think that if we nationalise the arms industry we must nationalise every industry.

284. That is your experience in Canada, is it?—Not only in Canada, but in this country too.

285. Having been an ordnance man I can hardly think of anything that is not wrapped up in it.—That is so.

286. *Sir Thomas Allen*: When you speak of a State-owned factory are you speaking of factories owned for the time being for the making of specific orders?—No, I do not mean that; I mean a factory such as Woolwich which could be extended as a permanent establishment for the manufacture of arms. I am not overlooking the question which was raised this morning about expansion and the need for expansion in time of war. That is a possibility.

287. In respect to placing an order with Vickers, say, with a State-owned factory?—Yes; that would become part of the State.

288. Permanently?—Yes.

289. *Sir Philip Gibbs*: If it does become part of the State permanently, it seems to me that that is nationalisation?—Of the final article, certainly.

289A. *Sir Thomas Allen*: I was going to pursue that. You will be creating a new authority, a third authority in that case, will you not?—I think not. In what way? I want to follow you.

290. The private manufacturer would still be allowed to exist under this scheme?—Certainly, but only for the supply of the raw semi-manufactured material in aid of the completed weapon.

291. But still he is an armament manufacturer?—Absolutely.

292. Engaging in a certain process up to a certain point?—Yes.

293. *Sir Philip Gibbs*: Do not you think that your system would eliminate the private manufacturer, and that if he cannot make profits and if he cannot tout in foreign countries and get orders in foreign countries, he could not carry on private manufacture; and it would really mean that he would surrender himself to the government as a private manufacturer except in so far as he is a manufacturer of steel or raw material?—Exactly so.

294. So it is the elimination of the private manufacturer of arms?—It is the elimination of the private manufacture of the finished arm. The output of every private manufacturer of arms at the moment, I should say—perhaps a little more now than a few years back—consists of perhaps 90 per cent. ordinary commercial products, and 10 or 5 per cent. armaments.

295. You think it is as high as that, do you?—I do not think it is as high in some cases; it would be less in many. Perhaps it is as high to-day; I do not know exactly; but what I mean by that is that the private manufacturer is not to suffer severely by reason of being deprived of the final manufacture, because he would still be licensed, if he were a suitable manufacturer, to produce the component parts and supply the raw materials; so that he would become a useful help in time of need even in expanding the instruments that he had in his possession.

296. *Professor Gutteridge*: There is a little difficulty in defining "components," is there not?—There is no difficulty when you come to the classification set forth in the American document.

297. How do you deal with the bolt of a rifle?—That is a component. If it is a finished bolt it is a component.

298. Would not it be possible in that case that by piling up enough components you pile up enough completed articles?—There is a danger, but can you conceive of a manufacturer piling up components if he has no outlet for them?

299. I was merely thinking if there was any dirty work going on?—Take a manufacturer; it is not likely that the board would place with A all the component parts.

300. I think that is the answer to the question?—They would be spread as at present. Take Woolwich, for instance; you purchase all the time many components from A, B and C factories throughout the country that are not recognised as armament manufacturers at all; they make certain commercial parts that fit the weapons that are used at Woolwich; and such people would still exist and would be useful in helping in the final manufacture. But what I do want to stress is that we do remove from the manufacturer the temptation to abuse which may arise and has arisen over solicitation and the use of propaganda; for I cannot conceive of a manufacturer owning the Press or spending money in advertising through the Press for orders that he is not likely to derive any benefit from. He would not be sure, under such a system as we propose, that he would receive any order at all; he would certainly not have the order for the completed weapon under any circumstances.

301. *Chairman*: Supposing he was in a trust?—Even then he could not. The State factories would make the completed article.

302. *Mr. Spender*: The only point which occurs to me is this: You are proposing to add another piece of machinery in the making of munitions between the beginning and the end?—Yes.

303. Of course, I agree it is very important to avoid abuses, but at the same time we do not want to run up against technical people who will say that speed and efficiency are very important in this industry, and by adding this additional piece of machinery, as they will call it, you are putting obstacles in the way. Cannot we find some method which will not be liable to that objection and yet will help to remove the abuses?—But, Sir, this proposal is on the lines of the ordinary rationalisation of industry to-day. There are bodies set up for dealing with the production and distribution of materials. In a sense it is a kind of combine; it is a combine for public value and public safety instead of for profit.

304. We are starting with great industries which have elaborate machinery for dealing with the finished product. Now we have to start by breaking those up?—No.

305. That is so, is it not?—No.

306. For the finished product?—No. That would not be the idea. The idea would be to use all the machinery, which now exists for the final completion of the weapons, where they are, or in any suitable place where they may be assembled, such as, if you had room, at Woolwich. You might make your armour plates there instead of at Sheffield, but there would be no real advantage either from the money point of view, or from the labour point of view, or from the point of view of having a central place for expansion, to shift the plant from Sheffield, but they would be purchased and owned by the State. That is the only difference I have to suggest.

307. Purchased?—Yes, owned by the State.

308. *Sir Thomas Allen*: Would the board be allowed to accept orders from abroad?—Manufacturers would not be entitled to receive orders from abroad through the board for completed articles; they would only have the component parts or the raw materials.

309. *Professor Gutteridge*: I gather that is the essential part of your scheme, is it not?—Yes.

310. *Sir Kenneth Lee*: How would you deal with the aircraft industry under your scheme?—May I

D

1st May, 1935.]

Colonel DAVID CARNEGIE, C.B.E., J.P.

[Continued.]

suggest what we did in Canada? We built a national factory there in an agricultural country for making aircraft, and to my amazement we were able to produce aircraft at the rate of five a day in a few months; and under the scheme we could certainly have all aircraft produced in the same way as naval products or land products, State finished, component parts made by private manufacturers.

311. It would mean that the State would buy the present aircraft factories?—Certainly that part of the factory where the final assembly took place.

312. There would be no aircraft factories except State owned?—None, for the complete aircraft, apart from State owned factories.

313. *Chairman:* Not even civil aircraft factories?—That is a question. I personally should include them all, but we are now dealing with the arms industry.

314. *Sir Philip Gibbs:* Is not that nationalisation under another name?—No.

315. It would eliminate the entire aircraft manufacture and take over the sheds of Vickers and other people. It seems to me that it is the

(*The Witness withdrew.*)

Mr. H. S. SYRETT, C.B.E., called and examined.

320. *Chairman:* I think you propose to give us a short statement? I think the public generally would like to know your special experience?—My special experience is that I am a member of the Executive Committee of the League of Nations Union; I am Chairman of the City Branch; and during the War I was personal private secretary to Mr. Lloyd George at the Ministry of Munitions. I mention the last matter as indicating that I have some knowledge of control, although I should not wish to be examined with regard to the activities of the Ministry of Munitions.

The matter which I wish specially to deal with is the question of the armaments board, which has already been dealt with by Colonel Carnegie. I should like to say, first of all, that, generally speaking, I am in entire agreement with what Lord Cecil said this morning with regard to the evils of the industry. I am not quite in agreement with him as to the desirability of nationalisation; I think that would be a very big problem and would meet with tremendous opposition, and from that point of view, at all events, it is not what I call practical politics. I am anxious to get something done, and I think that if the Commission would follow the proposals contained in this report of the Union, which were arrived at after a great deal of discussion of conflicting views, they would agree at all events that there is a good deal to be said for it. One or two questions which were put to Colonel Carnegie seemed to indicate that the Commission were not quite versed with the idea of the national armaments board as we visualise it. Our idea is that that should be a body of eminent persons appointed for a term of years and quite free from any political influence; and I must say, having had something to do with politics, that I think that is a very essential feature. We want to get a body of men, with possibly one or more women, who would be free from political influence or control, and would deal with the matter somewhat on the lines of the Electricity Board or other boards which are now set up and advocated with regard to what is known as the rationalisation of industry.

I think that the armaments industry, in common with a great number of other industries, would welcome such a proposal. In fact, only to-day, I see that Sir Harry McGowan at the meeting of Imperial Chemical Industries got up and defended himself and his company from any participation in the arms traffic. I think that the Commission will find, when they came to hear evidence from representatives of the armaments industry, that they are as anxious as anyone that their position should be regularised, if I may so describe it, and I think

nationalisation of the arms industry to a very great extent?—To a very great extent, but it does not eliminate private manufacture.

316. I am not so sure about that. There is not much left, is there?—There would be a great deal left. What I want to emphasise is this fact: that it would not deprive private manufacturers from receiving a fairly large quota, and that quota would be extended.

317. *Professor Gutteridge:* May I make a suggestion to you? I think what you really mean is this, is it not: that your scheme would avoid any possibility of having to nationalise every industry in the country?—Surely.

318. If you put it in that way, I am with you. But otherwise it seems to me to be a nationalisation scheme, up to a certain point at all events?—Yes.

319. *Chairman:* I think your scheme is first cousin to nationalisation?—Yes, of the arms industry, but not nationalisation of industry as a whole.

they would find that some such scheme as we have put forward in this report would work and would be welcomed by the industry. I am not suggesting that it is not capable of improvement; I am not suggesting that there are not a lot of details to be worked out; obviously there are; but I am not a technical man, I am a lawyer. I have followed the problem since the beginning of the War, and during the whole of the time I was associated with the Ministry of Munitions, and I have given some study to it. I think that if you got a body of independent persons appointed in that way, they would deal with a lot of the difficulties which were put to Lord Cecil this morning.

As regards the supply of arms to foreign countries, obviously if orders have to go through national armaments boards of this description there cannot be any graft, there cannot be any question of political or other pressure, there cannot be any question of commissions, there cannot be the abuses which are set out in this little pamphlet (No. 347) and have been referred to in the American Inquiry. They would be entirely free from any influence of that sort.

I am not quite sure that I understand Colonel Carnegie's method of working this armaments board. Speaking for myself—and I say at once that I am not a technical man, and there may be difficulties in what I am suggesting—I cannot see why the armaments board should not continue the present armaments system in existence, but subject to complete control, just in the same way as we controlled them at the Ministry of Munitions during the War. We had most effective control—financial control, technical control—and we had inspection from beginning to end, and we found that it worked extremely well. I am not such an extreme nationalist as some of my friends, who would wish to eliminate private profit altogether, but what I would like to see would be control; and during the War, as you know, by means of our system of accountancy we did control the profits made out of arms. I may mention, as Sir Thomas Allen knows, that I was also at the Food Ministry. We controlled the profits made out of food. It is a complicated matter, but it is not insuperable; they can be controlled. If it were possible to control the profits made by armament firms by this armaments board, surely it would be possible to avoid the scare raisings which go on—for instance, on the stock exchange during the last few days, because the public think there are going to be tremendous orders given for aircraft, with the consequence that up goes the price of aircraft shares. If the public knew that the armaments board controlled the profits made by aircraft firms,

1st May, 1935.]

Mr. H. S. SYRETT, C.B.E.

[Continued.]

then speculation in the rise and fall of shares would at all events be very much minimised; and my suggestion is that this national armaments board formed on the lines indicated in this report is a sound idea which could be put into force.

The objection which Mr. Spender made, that we do not want to set up more bodies, I quite agree with, but here we are up against a terrific problem, a great evil, and we have to get over it, and if by setting up a body of this kind which commands public opinion and public approval we are able to meet the problem, surely that is a way out of our difficulties. I think, as I said before, it would be a scheme which would be welcomed by the armament firms themselves. I believe that, generally speaking, they are as anxious as any citizen to avoid any suggestion that they are fomenting war or doing anything to encourage strife, but they have to carry on their business. At the present time they do not know how to carry their business on. Obviously, if they are to do it to advantage, they have to get all the orders they can; they have to take advantage of all new patents and new ideas which come into force, but if they have this armaments board to go to who will tell them what is wanted, how they are to carry on, what orders coming from abroad are to be fulfilled, and who is to carry out those orders, and what price is to be charged, their difficulties will be very largely removed; difficulties with regard to armament rings will be got over, because the armaments board will see that a proper proportion of orders is put with different firms; there need be no unnecessary competition in that regard, and in my view a large number of the armament firms would feel, as they did during the War, that they were really rendering a national service because they were carrying out the instructions of a public body to provide for the defence of the country. I am assuming, of course, that in the present stage we are unable to visualise the total abolition of armaments, or even any great measure of limitation.

Dealing with the international side of it, I agree that there may be difficulties there, because obviously we cannot say to all other countries in Europe and elsewhere, "Well, you set up armaments boards," but we could put the proposal before them, and even if this idea were not adopted by other countries, that would not prevent me from advocating it, because I believe that in matters of this kind example is far better than precept, and I think, as Lord Cecil said, that this country has now an enormous opportunity of giving a lead in this particular matter. How far it would commend itself to our American friends I do not know, because, though I am quite in favour of the suggestions made in their proposals, they would not militate against the proposals contained in this report. I think you would find that it would deal with a great many of the evils which at present surround the traffic. I think it is the first step towards taking profit out of war and of controlling the arms industry in an effective way.

321. *Chairman*: Under your scheme, supposing an order comes from abroad for some particular article of Vickers' manufacture, naming Vickers' name, and that comes to the board, would the board be obliged to pass it on to Vickers, or could they say: It is not Vickers' turn; someone else must have it?—Not necessarily. Obviously, if it was an article which only Vickers could supply, they would either have to take the course of saying to the foreign government, "We cannot agree to your having it," or they would agree; but it would have to go through the department and they would have an opportunity of seeing whether it was desirable to supply that particular government with that particular article.

322. Of course, if an order came for an article of Vickers' manufacture, and it came to the board, it would have to pass from the board to Vickers, and Vickers would have the same inducement to tot for the order as they have now?—Except that you would have the safeguard that it has to go through the supervision of the armaments board, who could say, from all their knowledge of the circumstances, the position of the foreign government, the nature of the article which was required, and the general position at the moment, whether it was desirable that that article should be supplied or not.

323. They might refuse to accept the order?—Yes.

324. *Professor Gutteridge*: It would prevent this commission on selling the same thing to two parties and then playing them up one against the other?—There is no doubt that if a supervisory body were set up it would be a safeguard against all that sort of thing.

325. *Sir Thomas Allen*: How could they decide, seeing that there would be no military person allowed to sit on the board?—Obviously they would have to take advice, in the same way as Cabinet Ministers have to take advice from the particular department concerned, but they would have the responsibility of saying whether the order was to be put through or not.

326. *Sir Philip Gibbs*: Would not there be considerable pressure put upon the board, by the Government itself, perhaps, if they felt, for instance, that the country was losing a great deal of money, say two million pounds a year, by the restriction of the export of arms; would not this board be rather under pressure from the government to increase its exports, and so forth?—There might be a certain amount of pressure, but I am imagining a board which would be above that pressure and would be able to stand up to it. After all, they would have the advantage of having public support and opinion behind them.

327. *Professor Gutteridge*: It puts an end to tout-ing; I think that is the great thing?—Absolutely.

328. And all this business of going about bribing?

—And all newspaper opinion.

329. That comes to an end?—Yes.

330. *Chairman*: Thank you. We are much obliged to you for your evidence.

(Adjourned.)

APPENDIX

OUTLINE OF EVIDENCE TO BE TENDERED ON BEHALF OF THE LEAGUE OF NATIONS UNION BY THE RT. HON. VISCOUNT CECIL OF CHELWOOD, P.C.

1. Public Opinion.

The Union's experience goes to prove that public opinion is deeply moved, not by any particular instance of this commerce, but by distrust of the system by which profit is derived from making and selling armaments, and is increased by every deterioration in international relations. The Union, judging by the evidence of its public meetings, its correspondence, etc., believes that Lord Halifax truly summarised the situation in saying " . . . this is one of the questions which arouse a very sincere and profound feeling in the minds of our people. . . . Rightly or wrongly . . . the great majority of them . . . conceive this question of the private manufacture of and trade in arms to be directly connected with the great issues of peace and war, on which they feel more deeply and vehemently than on anything else. Therefore, regarding war, as they do, as the greatest evil to which the nation can be exposed, and regarding it indeed as only justifiable in cases of ultimate and extreme national necessity, they are . . . disposed to regard the preparation of instruments of war as too high and too grave a thing to be entrusted to any hands less responsible than those of the State itself, fearing any intrusion into so dangerous a field of any interests less imperative than national security and national necessity."—(*House of Lords, 27th March, 1935.*)

A remarkable indication of the strength of this public feeling is afforded by the votes recorded in the National Peace Ballot. The thirty-eight Societies who have united in asking British citizens over eighteen years of age to express their views by voting in this Ballot on five questions of international policy have included the following question:—

"Should the manufacture and sale of armaments for private profit be prohibited by international agreement?"

Out of the votes already recorded* 5,276,899 have answered this question in the affirmative and 391,946 in the negative.

Through its relations with the International Federation of League of Nations Societies and its correspondence with these and other foreign associations, the Union has learnt that the same strong feeling prevails in many other countries; in France, for instance, where, in response to public demands, proposals for the nationalisation of the industry have been put forward by Government; in the United States, where the Senatorial Inquiry was instituted in response to a similar public demand. The resolution on this subject unanimously adopted by the most recent Congress of the International Federation of League of Nations Societies held in May, 1934, is in the following terms:—

"XVIIIth PLENARY CONGRESS,

"Voices once more the demand of public opinion that prompt and energetic measures should be taken against those industrial and financial interests who derive profit from the manufacture of and traffic in arms by sustaining the war spirit and by paralysing all efforts for peace and disarmament."

2. Grave Objections to Private Manufacture and Trade.

The Union as a whole maintains that this anxiety of public opinion is well-founded and that the grave objections mentioned in the Covenant do not admit of serious doubt. At the same time the Union has no special means of ascertaining how any armament

firm conducts business. It cannot, therefore, profess to offer direct evidence of the evils in question. Its knowledge depends on published facts which cannot be unknown to the Royal Commission (e.g. the Shearer case, 1927; the Skoda case, which led the Roumanian Chamber of Deputies to recommend, on 27th March, 1935, the prosecution of General Cihosky and the former Minister, M. Popovici; and the Swedish Air Force scandal of 1931). The continuance of the war between Paraguay and Bolivia, despite the repeated efforts of the League of Nations to bring it to a conclusion, was made possible, according to the report of the Chaco Commission of the League, by the constant supply of arms to the belligerents by armament firms in other countries.¹ It is only too clear from the financial columns of the daily press, that the deadlock in the Disarmament Conference, together with the tension recently obtaining between the Great Powers, have added considerably to the profits of such firms.²

Such experiences lead to the conclusion that the commercial activity of the armaments trade tends to be inconsistent with negotiations for disarmament and the pacific settlement of disputes. It may easily become an influence hostile to the "good understanding between nations upon which peace depends".

While, therefore, the Union suggests certain ways in which the Royal Commission might use the powers conferred upon it to bring to light concrete evidence about the working of the industry (e.g. by calling for records and evidence of the McKinnon Wood Committee of 1919; by verifying communications from and contracts affecting British firms produced in the U.S. Senatorial Inquiry³), the Union's main contention is that unrestricted manufacture or sale of arms by private enterprise is, by the nature of the case, likely to become incompatible with the purposes of the Covenant of the League of Nations.

3. Remedies.

Opinion in the Union is divided upon the question whether the necessary remedy should take the form of the national and international control of private firms engaged in the trade or of a State monopoly of armament manufacture in each country. Proposals and suggestions for carrying into effect both these measures are contained in special reports produced by committees of the Union and published as a basis of study (pamphlets 347 and 359). The principal official documents presented to the League of Nations or the World Disarmament Conference on this subject have been reprinted by the League of Nations Union. This volume⁴ is at the disposal of the Royal Commission and will be used for reference by members of the Union whom the Royal Commission may desire to call before it. Members of the Union's special committees on this subject are at the disposal of the Royal Commission to answer questions or give explanations (Mr. P. J. Noel Baker, Colonel D. Carnegie, Miss K. D. Courtney, Major the Rt. Hon. J. W. Hills, M.P., Captain the Hon. J. de V. Loder, M.P., and Mr. H. S. Syrett), as are the Union's permanent officials who have given special study to this subject.

(a) State Monopoly.—A considerable body of opinion in the Union's ranks holds that the disturbing influence exerted by the private armaments industry can only be overcome by the transfer of that

¹ See Annex, NOTE A.

² See Annex, NOTE B.

³ See Annex, NOTE C.

⁴ "Documents on the Traffic in Arms."

* 11th April, 1935.

industry to the State. They regard it as a more efficient, if more drastic, remedy than the public control of the industry. They recognise the technical difficulties arising from the fact that the manufacture of products designed for military purposes and of those designed for peaceful purposes is intermingled. They hold, however, that the desired end could be achieved were the State to concentrate in its hands the completion of the manufacture of clearly defined categories of arms, munitions and implements of war such, for instance, as are laid down in the Draft Convention put forward by the American Government on 20th November, 1934. Those who take this view desire the suppression of the private manufacture of arms in the sense described in the following passage from the joint memorandum of the Danish, French, Polish and Spanish delegates presented to the Disarmament Conference (Conf. D./C.G./48, 3rd March, 1933):—

"The abolition of arms manufacture is not designed to concentrate in the hands of the State all manufacture that might serve to produce arms. The sole object is to reserve to the State that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes and destines it exclusively for military use."

They would also contend that the objection to the establishment of a State monopoly which arises from the present state of international law relating to neutrality could be overcome by the answer contained in the same joint memorandum and by other considerations of a like nature.⁵

(b) *Control*.—Another section of the Union's members, who are averse to nationalisation on grounds of international policy or national defence, or do not believe it to be possible on technical grounds, favour the general expansion and improvement of the system of export licences at present obtaining in Great Britain. Under the heading of improvements in this system would be included measures providing for publicity for orders, exports and imports, a system of inspection and the extension of the licence system to manufacture.

4. International Action.

The Union does not believe that a mere system of control without any limitation of armaments would

⁵ See "Documents on the Traffic in Arms," pp. 25-33.

be very effective. It is, however, argued that State monopoly would be of a certain value in counteracting the objections to which the Covenant refers even without an all-round limitation of armaments. Whatever remedy is adopted, the Union is united in its belief that such remedy, to be effective, must be embodied in an international convention. Its members would all be prepared to accept the general lines of the American Draft Convention⁶ as a first step, but most of them would desire to go further. This treaty, while leaving it open for the High Contracting Parties to have arms manufactured in private factories, in State arsenals, or in both, stipulates that they must assume entire responsibility for the manufacture and trade in their respective territories. The Union would regret any amendment to the draft convention which would lessen its effectiveness and hopes that the Royal Commission will recommend the signature and ratification of such a treaty under the second of their terms of reference.

Under the third term of reference it would be appropriate to suggest the modifications of the present arrangements in force in the United Kingdom relative to the control of the export of arms, which ratification of such a treaty would involve.

To sum up, the Union believes that the unrestricted manufacture and sale of armaments by private enterprise is open to grave objection. A considerable section of its members are of opinion that the most effective remedy would be to make such manufacture and sale a State monopoly: others are opposed to a State monopoly and believe it possible to establish effective control of the industry. They all believe that without limitation of armaments by international agreement neither remedy would be completely successful. They are further agreed that any remedy should be international in character applied by international agreement. All would desire agreement with the United States, and as a first step the adoption and ratification of measures not less effective than those which the American Government have recently proposed.

⁶ *Ibid*, pp. 80-101.

Annexe

NOTE A.

EXTRACT FROM REPORT OF CHACO COMMISSION TO THE COUNCIL OF THE LEAGUE OF NATIONS.

"The armies engaged are using up-to-date material; aeroplanes, armoured cars, flame projectors, quick-firing guns, machine guns and automatic rifles; the automatic weapons are available in great quantities, but the other arms are few. The arms and material of every kind are not manufactured locally, but are supplied to the belligerents by American and European countries."

NOTE B.

THE ARMAMENTS INDUSTRY AND THE DISARMAMENT CONFERENCE.

The Disarmament Conference began in January, 1932, and at first promised to succeed. It was at this time that Sir Herbert Lawrence (Chairman) stated at the annual meeting of Vickers, Ltd.:—

"Reductions in armaments, under the influence of public opinion, have affected adversely your company's trading result."

¹ League of Nations Document C. 154, M. 64, 1934, vii.
² 8th April, 1932.

Later, however, the progress of the Conference was suspended; and since October, 1933, the relations of the Powers of Europe have grown increasingly strained.

The result has been a marked increase in national armaments. The increase is most evident in air armaments. During 1934 the following states (among others) announced enlarged air-programmes: Britain, France, Italy, United States, Russia, Sweden, Spain, Portugal, Greece.

The following table gives such figures as can be ascertained for the air strengths of the Great Powers:—

Approximate numbers for military and naval aeroplanes of chief Powers—Various dates.

Explanatory Note.

There appears to be no authoritative or complete up-to-date list of figures for the air forces of the chief Powers. The development of the air weapon is one of the chief features of post-war armaments policy. Some Governments maintain great secrecy even as to the approximate totals of their air forces. Such statistics as are available are rarely based on the same calculations; some refer only to front line planes, others include reserves, or training planes and so on. Information is least available as regards

the development of the air weapon in Russia, in Japan, in Italy and recently in Germany. But in general such information as is officially supplied to the League Secretariat for the Armaments Year Books is inadequate and out of date.

The figures given below are therefore very approximate and must be regarded with some reserve. But they do mark, in a general way, a rapidly changing development of a new weapon for war of which the offensive, destructive capacities seem incalculable.

The authority for A and B in the following table is the *Foreign Policy Bulletin* "Limitation of Air Armaments", October, 1930. For C the authority is

official figures supplied by Governments to the Disarmament Conference in 1932: these give "total aeroplanes", but Russia, France and U.S.A. do not give full figures for reserves.

For D the authority is the German publication *Volkerbund*, 10th October, 1933; the figures are stated to include all active reserve, school and training planes, and some factory reserves. But the *Volkerbund* quotes no source for its detailed information. For E the authority is a statement by the British Under-Secretary for Air in the House of Commons on 20th February, 1934. For F the authority is the military aviation correspondent of the *Daily Telegraph*, 18th July, 1934.

	Great Britain.	France.	Italy.	Japan.	Soviet Russia.	U.S.A.
A.						
1919-1920—Effective aeroplanes ...	14,000 (3,300 front line)	12,000	—	—	—	10,000
B.						
1922—Front line	368	928	454	—	—	630
C.						
1931-1932—Totals	1,434	2,375	1,507	1,639	750	1,752
D.						
1933—Totals: active reserve and training, and on stocks.	2,400	4,500	1,500	2,000	2,700	3,058
E.						
1934—Front line	850	1,650	—	in process of development.	1,300 to 1,500	1,000 to 1,100
F.						
1934—Totals including reserves ...	1,434	3,000	1,500	1,939	1,700	2,351
1935—Established totals	1,500	3,020	1,640	2,100		2,660
1934—Front line	910	1,650	1,500	1,385	1,300 to 1,500	1,100

Note on German Air Strength.

By the Treaty of Versailles Germany is not allowed to possess any military or naval planes. But there is no doubt that since 1933 she has been, in spite of the treaty, building up an effective air force. Mr. Baldwin, in November, 1934, in the House of Commons, gave an approximate figure of over 400 machines. This total has since been outdistanced. In March, 1935, "Air personnel" became part of the official Reichswehr. On 16th March the German Government denounced the restrictions of the Versailles Treaty. The Foreign Secretary informed the House of Commons on 3rd April that, in the course of the Berlin conversations, Herr Hitler had stated that Germany had already attained parity with Great Britain.

Note on British Air Force.

Lord Londonderry, Secretary of State for Air, in a Memorandum attached to White Paper Cmd. 4822, 1935, on Air Estimates, stated that the British air programme, launched in July, 1934, would provide, on completion in 1938, a total first-line strength, in regular squadrons, of about 1,330 aircraft; and 130 aircraft in non-regular squadrons.

This competition in air armaments was reflected in the increased value of the shares of British aircraft manufacturers. Thus *The Investor*² reported:—

"The rise in aircraft shares."

"The demand for aviation shares was stimulated by the declaration of Mr. Baldwin that in the event of the failure of the Disarmament

Conference this country would feel compelled to embark upon a big programme for strengthening its air defences. Apparently there is little chance that the Conference will be saved, and consequently it is considered that there is every prospect of a substantial increase in the production of aircraft in this country, thus greatly augmenting the profits of the manufacturing companies. Apart from this, the past year or two has witnessed a very big increase in the development of civil aviation, and the chances are that this progress will become more pronounced in the future. It is not surprising, therefore, if many investors are now considering the advisability of buying aviation shares, despite the remarkable rise in prices already recorded this year, in view of the prospective increase in profits and dividends. Before considering whether such purchases can be recommended, it may be useful to indicate the upward movement in shares of the leading companies this year:—

	Lowest in 1934.	Recent Prices.	Rise from Lowest.
	s. d.	s. d.	s. d.
De Havilland	37 6	66 0	28 6
Fairey Aviation 10s. ...	25 7½	35 0	9 4½
Hawker 5s.	18 9	28 3	9 6
Napier 5s.	7 7½	14 0	6 4½
Rolls Royce £1 units ...	75 10½	105 6	29 7½"

The point of view of the aircraft manufacturers in regard to the reduction or expansion of armaments

² *The Investor*, 26th May, 1934.

is indicated by the following quotations from directors' speeches:—

Mr. S. R. Worley (Chairman) is reported to have said at the annual meeting of Handley Page, Ltd.¹⁰ in 1934:—

"The directors noted with satisfaction that on the breaking down of the Disarmament Conference the Government had decided upon increasing the Air Force to bring it more into line with the other nations, and they were hoping that in the near future they might receive further orders."

Mr. T. O. M. Sopwith, C.B.E. (Chairman), is reported to have stated at the 1934 annual meeting of Hawker Aircraft, Ltd.¹¹:—

"Excellent relations with Air Ministry."

"Our relations with the Air Ministry are on an excellent basis, and technical co-operation is carried out to the fullest possible extent. We have delivered during the past year more aircraft than any other firm in any one year since the war. (Applause.) We now manufacture eight different types of Hawker aircraft for the British Government. The Air Ministry continue to exercise their rights under the royalty agreement whereby Hawker 'Hart' type aircraft are sub-contracted to other firms and additional orders have recently been placed. At the moment it is no exaggeration to say that in their respective classes Hawker types are the foremost in the world, and it is important and interesting to record that the British Air Ministry are purchasing these air-frames at lower prices than any other Government is paying for comparative types. Not only so, but, despite their superior performance, Hawker types have proved most economical under service conditions and have definitely set new and considerably improved standards from the point of view of length of life before reconditioning."

"Foreign business continues to be satisfactory. During the year under review we have delivered aircraft to four foreign Governments, where they have given satisfactory results. At the moment orders are in hand for three foreign and two Dominion Governments. The total value of these orders is very substantial, and we anticipate that deliveries will be completed within the current financial year. Apart altogether from the sale of aircraft abroad, we have disposed of the manufacturing rights of certain of our products in South Africa, Denmark, Persia and Sweden, while options are held by certain other countries pending completion of tests. Royalty is accruing, and will accrue, from these sources and revenue is received for the purchase of manufactured components and spare parts for the construction and maintenance of these aircraft." . . .

"Strength of the R.A.F."

"Although there has been a considerable amount of discussion as to the necessity of increasing the Royal Air Force no active steps have yet been taken. It should be obvious to every right-thinking person in this country that not only the safety of the nation but the future of the Empire demands an Air Force at least equal to that of any other. The disparity with the strength of other Powers is perturbing and, whatever future policy is decided upon, the Royal Air Force is at present too small to cope with an emergency, and the reserves are too inadequate to cover the period between the outbreak of such emergency and the day when the industry could raise its output to meet the increased demand."

The export trade in armaments as a whole also profited during this period of international tension:—

Figures given by the Board of Trade on June 15th, 1934, indicate the increase of such

exports in the first five months of 1934 as compared with the equivalent period in 1933.

	1933.	1934.
	£	£
Ammunition	805,194	934,668
Arms	248,478	355,722
Torpedoes and submarine mines	28,854	85,061
Other ordnance	283,093	105,656
War vessels	Nil	276,896
Aircraft	560,023	724,233
	£1,925,642	£2,482,246

Foreign firms were similarly affected. Thus the following report¹² is available of the increased prosperity of the French firm of Hotchkiss:—

"An increase in dividend was announced at the annual meeting in Paris of the Hotchkiss Company, the large international armament firm."

"A dividend of 16s. 10d. a share for 1933 was announced compared with 15s. 7d. for 1932. Profits for 1933 were higher by approximately £200,000."

"The Hotchkiss Company makes arms of all kinds, including the famous machine-gun British, French and American capital is invested in the company. The Japanese Army machine-gun is made under Hotchkiss patents."

Vickers Armstrongs, in 1935,¹³ showed a profit in armaments business for the first time for five years:—

"Vickers-Armstrongs Limited—the main subsidiary in the Vickers group—has for the first time since 1930 earned sufficient profits to pay a full year's dividend on the 'A' Preference shares. This result is all the more gratifying as until December 31, 1932, the company had the benefit of the guarantee given by the Sun Insurance Company. The greatest credit reflects upon the managing director—Sir Charles Craven—and those associated with him for the satisfactory results attained. (Hear, hear.)"

"At Barrow there are now under construction four submarines, two destroyers, and three large passenger liners for the P. & O. Company, the Orient Company, and the Union Company of New Zealand. H.M.S. Ajax, a first-class cruiser, five submarines, and two destroyers were completed in 1934."

"During the year the naval yard at Walker-on-Tyne was reopened, and under construction there are H.M.S. Newcastle and H.M.S. Sheffield, both first-class cruisers of a new type, and two destroyers for the British Navy. The machinery for the cruisers is being built in the engine shops at Barrow."

"The total number of employees in the Vickers-Armstrongs works and subsidiary companies at the present time is 30,200 compared with 24,600 in January, 1934—(applause)—and as the order book of the Vickers-Armstrongs group is better than it was at this time last year, it is hoped that a steadily increasing number of people will be employed."

Other evidence of the same kind could doubtless be discovered by a closer examination of the stock markets, etc. But, indeed, it is a case to which the maxim *res ipsa loquitur* may well be applied.

NOTE C.

DOCUMENTS ILLUSTRATING THE INTERNATIONAL CONNECTIONS OF BRITISH ARMAMENT FIRMS CITED IN THE RECORD OF THE UNITED STATES SENATE INVESTIGATION INTO THE MUNITIONS INDUSTRY, SEPTEMBER 4TH-21ST, 1934.

(The figures given below are those attached to the documents as exhibits in the official American record, together with the part of the Inquiry to which they relate.)

1. Agreement between Imperial Chemical Industries as successors to Messrs. Nobel and two German companies: Part V, exhibit 512.

¹⁰ British United Press, 29th May, 1934.

¹¹ Vickers, Ltd., Annual Meeting, 2nd April, 1935.

¹² 5th July, 1934.

¹³ 12th July, 1934.

2. Letter from Sir Harry McGowan, Chairman of Imperial Chemical Industries, to the Du Pont Company: Part V, exhibit 516.
3. Letter from L. Y. Spear, Vice-President of Electric Boat Company, to Vickers Ltd. *re* supply of war vessels to Chile: Part I, exhibit 68.
4. Correspondence between Electric Boat Company and Sir Basil Zaharoff: Part I, exhibits 31, 32 and 36.
5. Military sales agents shared by Du Pont Company and Imperial Chemicals, Ltd., in Argentine, Brazil, Bolivia, Chile, Colombia, Ecuador, Paraguay, Uruguay and Venezuela: Part V, exhibit 483.
6. Letter from L. Y. Spear, Vice-President of Electric Boat Company, to Sir Trevor Dawson, Chairman of Vickers, 1924: Part I, exhibit 89.
7. Correspondence between Electric Boat Company and Vickers Ltd. *re* Brazilian Naval programme, 1933: Part I, exhibits 105-109.
8. Licence agreement of December 12th, 1902, modified by agreement of October 21st, 1913, *re* patents, secret processes and division of profits between Electric Boat Company and Vickers Ltd.: Part I, exhibits 11 and 11a.
9. Licence and sales agreement of March 4th, 1924, between same companies: Part I, exhibit 12.
10. Construction agreement of March 4th, 1924, between same companies: Part I, exhibit 12.
11. Statement of royalties received by Electric Boat Co. from Vickers Ltd. and firms licensed by Vickers, Ltd. (Mitsubishi, Japan; Vickers, Holland; de Schelde, Holland; Vickers, Australia; La Sociedad Espanola Construcion Naval, Spain; etc.): Part I, exhibit 8.
12. Licence agreement of January 1st, 1926, between Du Pont and Nobel Industries Ltd. (now I.C.I.): Part V, exhibit 473.
13. Relations between Du Pont and I.C.I., including sales agreement of October 10th, 1932, replacing agreement of 1928, for sale of military explosives in Europe, Asia and South America: Part V, exhibits 463-465.
14. Licence agreement of 1933 between Du Pont, I.C.I. and Canadian Industries Ltd. (jointly owned by Du Pont and I.C.I.): Part V, exhibit 475.
15. I.C.I. Ltd. Subsidiary companies and investment and contractual interests in world markets affecting Austria, Belgium, France, Czechoslovakia, Germany, Roumania, Spain, Hungary, Africa, Argentine, Australia, Canada and Chile. Sales agreements with explosives and chemical companies in Belgium, France, Germany, Italy, Norway, Africa and Switzerland: Part V, exhibit 461.
16. Report from Sir Basil Zaharoff to Electric Boat Company, 1927, *re* Spanish naval contracts: Part I, exhibit 35.
17. President of Electric Boat Company to Sir Basil Zaharoff, 1928: Part I, exhibit 37.
18. Minutes of a meeting between representatives of Du Pont and Nobel Industries, Ltd. *re* manufacture of explosives in Chile, 1927: Part V, exhibit 514.
19. Letter from Soley Armament Company, Ltd. to American Armament Corporation, February 3rd, 1934, *re* sale of arms in China: Part III, exhibit 256.
20. Letter from Soley Armament Company to the American Armament Corporation *re* indirect supply of arms to Bolivia: Part III, exhibit 260.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

SECOND DAY

Wednesday, 22nd May, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKS, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Sir EUSTACE HENRY TENNYSON D'EYNCOURT, Bart., K.C.B., F.R.S., LL.D., D.Sc., called and examined.

331. *Chairman*: What has your experience been? First of all, what was your original training, and then would you tell us what offices you have held of different kinds?

Sir Eustace d'Eyncourt: Originally I was trained as an apprentice at Messrs. Armstrong, Whitworth's, at their Elswick Works, Newcastle, where I served my time in various trades as an apprentice. During part of that time I went to the Royal Naval College, Greenwich, to do the course of naval architecture there. I began that apprenticeship in 1886, and I was with Messrs. Armstrong until 1912, with the exception of four years, when I was naval architect with the Fairfield Company at Glasgow on the Clyde. I worked on ship designs and to some extent on gun mountings, and so on, when I was at the Elswick Works. In 1912, when Sir Philip Watts left the Admiralty, I was appointed Director of Naval Construction. In that position I was responsible for the design and construction of His Majesty's ships, and I held that position until 1924, when I resigned. While I was at the Admiralty I was not only responsible for the design of the ships, but I was also responsible for the design of the airships, which were just beginning to be developed at that time; and, further, Mr. Churchill, when he was First Lord of the Admiralty, asked me if I would undertake the responsibility of forming a committee to develop land ships. That committee produced the first of the tanks which fought in the war. After my time at the Admiralty I returned to Messrs. Armstrong, Whitworth with a seat on the board, as a director, and as naval architect in charge of the design, and construction, of all their ships. Soon after that there was a change in the affairs of the company, and I had to leave the board, and since that time I have been retained as adviser by Vickers-Armstrong (Vickers having amalgamated with Messrs. Armstrong); and also when I left the Admiralty I was retained as adviser to the Admiralty for the ships which were under construction, which I had designed, such as the "Rodney" and "Nelson" and various others.

332. *Chairman*: Have you retired now altogether from any form of practice?

Sir Eustace d'Eyncourt: I work for Vickers-Armstrong to some extent, and I am a director of the Parsons Steam Turbine Company at Wallsend, and I do a certain amount of consulting work as a naval architect and engineer, too.

333. *Chairman*: While you were serving your time with Messrs. Armstrong did you go through the whole of the shops, or were you confined to any particular branch of their business?

Sir Eustace d'Eyncourt: No; I went right through the shops and worked at everything. I was a riveter, carpenter, and blacksmith and other trades; but that was in the shipyard, not in the ordnance works.

334. *Chairman*: I think you have prepared and submitted a statement, have you not, dealing with the matters which we as a Commission have to express an opinion upon?

Sir Eustace d'Eyncourt: Yes.

335. *Chairman*: Would it be convenient that you should read it, do you think?

Sir Eustace d'Eyncourt: Yes; I shall be very glad to read it, if you wish.

336. *Chairman*: Very well.

Sir Eustace d'Eyncourt: (*reading*) The aspect of this question to which I specially wish to draw attention is the necessity of ensuring that war material should be of the best and most efficient design and construction. That this is a necessity is obvious, whatever the decision on the question of limitation of armaments may be; although it may be argued that the more limited the quantity the better still should be the quality.

Having had experience with establishments manufacturing armaments, and with government departments, for nearly fifty years, I have been in a position to form an opinion on the subject; and as the result of the most careful study of the question, my considered opinion is that to abolish the private manufacture of arms altogether and put the whole thing under government control would certainly not make for efficiency.

There are many reasons for arriving at this opinion.

With private firms, not only is there competition between one firm and another—whether in the case of home firms against one another, or British firms versus foreign firms—but there is a strong incentive to individuals to find some new and improved devices which will not only help the firm for whom they work but will also improve their personal position with that firm. This is a consideration which does not exist to nearly the same extent in government departments.

The average man who enters government service knows that he accepts a position and a salary of moderate amount, and his great desire is to continue to do his work in the position in which he finds himself, and he does not wish to take on any added responsibility, nor to get into bad odour with his superiors by making suggestions which may probably be scouted as impracticable; and above all he does not want to make any mistakes in his work which can get him into trouble.

22 May, 1935.]

SIR EUSTACE HENRY TENNYSON D'EYNCOURT, Bart., K.C.B.

[Continued.]

This attitude, which my experience shows exists widely in various departments of the government service, does not make for great improvements or help inventive genius. Though, of course, there are outstanding men who have done marvellous work for the Government, a little reflection shows that practically all the great inventions and improvements in engineering, etc., have emanated from men outside the government service. It is only necessary to mention the Armstrong gun, Parsons steam turbine, wireless, the internal combustion engine, the aeroplane, amongst many others, all of which were invented and developed by private enterprise.

During the war, numbers of men in the government service certainly developed various new inventions; but most of these were men who at any rate started in a private capacity, and only came into government service as a war-time measure.

A notable instance which came under my own purview was that of the tanks. This particular form of mechanised warfare which did so much in the latter years of the war, was definitely given up as impossible by the War Office. Mr. Winston Churchill (who was then First Lord of the Admiralty) with great foresight saw the possibilities of the suggestion, and asked me—as I was a designer of warships—to form a committee to produce “land ships.” The men who did this work were men from private establishments, and as the constructors under me at the Admiralty were fully occupied with ships I was not able to engage their time on the matter. The men who developed the design and construction of the tanks were all drawn from private sources.

I have seen enough of work, both in government service—the Munitions Department, the War Office and the Admiralty—to say that it is of the utmost importance to be able to draw upon the genius and skill of men outside the service for new developments and thus obtain the most perfect and efficient material for our purposes.

There are several small points which tend to damp down the ardour and keen inventive capacity of men in the government service. For instance, a patent taken out by a servant of the Admiralty, under his conditions of service must be assigned to the government department for which he works.

Another point is that with the building of warships in particular—and in all government contracts placed outside—the materials being of the highest class helps to produce a large number of workmen of the highest skill in various branches of engineering, and it has been of the greatest importance that these men have been distributed about the country and have used their skill not only on the production of war material, but also on the highest class of products for civilian and private work; and it was largely this fact which gave us the lead in engineering, shipbuilding and kindred industries.

Already the gradual reduction of the number of these men in private works has had its effect; and the foreigner has of late years—and especially since the war—become almost, if not quite, equal to the British workman in the production of the best material of various kinds. If a sudden demand for skilled labour be made at any time it is vital to be able to draw men from all parts of the country, and not merely from a few government establishments.

Whilst advocating the private manufacture of armaments, and although I have made the remark that I do not think the government service is a favourable atmosphere for the production of the most efficient and latest designs of war material, I do not for a moment want to imply that government servants are not fully equal to men outside; but the conditions are such that they have not the same chance of developing or showing the inventive capacity of which they are capable.

It is my belief that if the supply of war material were left entirely in the hands of government establishments, we should achieve a production of material of a sound and stereotyped kind but of an average mediocrity, which would not realise the best or latest improvements which are likely to be obtained if the production of war material be more widely spread in various private establishments throughout the country.

337. *Chairman*: Is there anything you wish to add to that statement?

Sir Eustace d'Eyncourt: Yes. I should like to add that one of the troubles with regard to the idea of a new form of mechanical apparatus, or whatever it is, under the government service is that it is so much easier in private firms to get the money quickly. A young man comes along with a good idea and it is submitted to a few of the head people, and they say: “Well, what will it cost to start?” and then they say: “We shall want some new plant—£5,000 or something”; and you can get that through directly. In the government service it has to go through the Treasury and round and round, and a lot of people make objections to it. All these things put the brake on the production of new inventions.

338. *Chairman*: Your evidence is directed practically entirely to the question of efficiency?

Sir Eustace d'Eyncourt: Yes.

339. *Chairman*: In your view, and as a result of your experience, you think that you are more likely to get efficient national service if the private factories are retained?

Sir Eustace d'Eyncourt: Yes, emphatically so.

340. *Chairman*: On the question of efficiency, of course a great deal depends upon whether you have an efficient staff of skilled men, does it not?

Sir Eustace d'Eyncourt: Yes.

341. *Chairman*: Assuming that it was thought right to abolish private manufacturers of arms and nationalise the service, would there be a difficulty, in your opinion, in retaining or supplying a sufficient number of skilled men in a national factory?

Sir Eustace d'Eyncourt: Yes, I think there would be considerable difficulty. The trouble is the individuals; it is not easy for them to come to the top as soon as they have got into the government service.

342. *Chairman*: Yes; but if there was a government service for the supply of munitions, it would be confined to the supply of munitions, I assume?

Sir Eustace d'Eyncourt: Yes.

343. *Chairman*: In private factories are there men employed in branches of the work of the factory other than arms, who can be drawn into the arms service in the event of pressure?

Sir Eustace d'Eyncourt: Yes, certainly.

344. *Chairman*: I mean, is the amount of skill that they acquire in other branches of work of value if there is found to be a great pressure of work in the manufacture of arms?

Sir Eustace d'Eyncourt: Yes, it would certainly be of great value.

345. *Dame Rachel Crowdy*: You lay great stress on the fact that initiative is cramped in government service. That is one of your chief arguments, is it not, against government manufacture?

Sir Eustace d'Eyncourt: Yes.

346. *Dame Rachel Crowdy*: It seems to me to be rather a sweeping statement. You say: “. . . the conditions are such that they have not the same chance of developing or showing the inventive capacity of which they are capable.” Then you also say at the beginning: “This attitude, which my experience shows exists widely in various departments of the government service, does not make for great improvements or help inventive genius.” Is that your general opinion of government service? I have

22 May, 1935.]

SIR EUSTACE HENRY TENNYSON D'EYNCOURT, Bart., K.C.B.

[Continued.]

in my mind, of course, at the moment the Post Office, and I think that none of us would deny that there has been a great deal of scientific research in the Post Office organisation and a great deal of invention within the Post Office, which, after all, is essentially a government service?

Sir Eustace d'Eyncourt: Yes. Of course, I would not for a moment deprecate the research work done by the Department of Scientific and Industrial Research, with which I am connected. The National Physical Laboratory do magnificent work in the research line, and the work they do and the researches they complete are of the greatest help in developing things like aeroplanes, and so on; but, at the same time, I think these improvements are more quickly developed by private firms, who have the advantage of being able to consult the government research departments.

347. *Dame Rachel Crowdy:* Therefore you really feel that it is in connection with this one particular subject, armaments generally, that research is cramped within government departments?

Sir Eustace d'Eyncourt: Yes. I have been thinking about armaments in the whole matter; I have not thought about the Post Office particularly.

348. *Sir Kenneth Lee:* One of your points is that there will not be skilled men available. Are skilled men so important to-day as they were before the war?

Sir Eustace d'Eyncourt: I should say so—even more so. Things are becoming more scientific, and more accurate workmanship is wanted in almost everything.

349. *Sir Kenneth Lee:* But is not the machinery more automatic?

Sir Eustace d'Eyncourt: Yes; but someone has to make the machinery; that is one of the great points. The fellows who make the jigs and gauges are perhaps the most skilled men of all.

350. *Sir Kenneth Lee:* But do not they make them now in the government service?

Sir Eustace d'Eyncourt: Yes, I suppose they do to a certain extent; but you want a lot of these men, and when a large quantity of material was wanted there would probably be a shortage of the most skilled men who make the jigs and gauges and who carry out the draughtsmanship, and so on, of all this very complicated machinery, which is getting more complicated and scientific every day.

351. *Sir Kenneth Lee:* But it is more on the gauge side than on the ordinary production side that you think skill is required?

Sir Eustace d'Eyncourt: No; I think both.

352. *Sir Kenneth Lee:* You say that people working for private firms get patents and keep them for themselves. Is that so?

Sir Eustace d'Eyncourt: I do not think they keep them for themselves; they take out a patent and try to develop the invention and make money out of it.

353. *Sir Kenneth Lee:* Do not nearly all large concerns put their servants under some obligation?

Sir Eustace d'Eyncourt: A great many do; that is quite true; but I think the servants generally get a good deal of consideration from the firm for what they have done; and, of course, there are a large number of inventions which are made by people, in their private capacity, who are not in the service of any big firm at all, perhaps.

354. *Sir Kenneth Lee:* As I understood your evidence, I thought you meant that such firms as Vickers did not put their people under any obligation.

Sir Eustace d'Eyncourt: I do not know exactly what obligation Vickers put their people under, but I know that in the ordinary government service there is not much encouragement to the inventor in the ordinary way.

355. *Sir Kenneth Lee:* But is it not probably because they have not had the opportunity?

Sir Eustace d'Eyncourt: Well, I have endeavoured to show in my memorandum how difficult it is for them to bring their inventions forward and to get them adopted and encouraged, to find money to start them, and so on, in the government service. Of course, in the war it was very much easier, because money was no object and one got away with the thing; but in the ordinary way the government arrangements are very clogging for developing a new idea.

356. *Sir Kenneth Lee:* Your evidence suggests, of course, that people working for the State do not give of their best?

Sir Eustace d'Eyncourt: Well, I think they give of their best in a sort of way, subject to the feeling that they do not want to add to their responsibilities or get into bad odour from being a nuisance to their superiors, which comes in a good deal.

357. *Mr. Spender:* Might not it possibly be said that the conditions you describe are the natural result of relying mainly on private firms, and that you might have another system in which the incentive to private effort and to research and enterprise might be as strong as they are, say, in the Post Office? I am not expressing any opinion as to the right or wrong solution, but I am putting that to you on this particular point.

Sir Eustace d'Eyncourt: It would want a great deal of reform and re-modelling of the procedure, and so on.

358. *Professor Gutteridge:* If one approaches this from the point of view of our national security, I suppose the most important point is to ensure an adequate reserve of highly trained men. Is that so?

Sir Eustace d'Eyncourt: Yes, I think so.

359. *Professor Gutteridge:* Is it your view that that would be quite impossible under a national system?

Sir Eustace d'Eyncourt: I think it is very much more difficult; and I think, as I have said, that the results of most of the great inventions coming through private individuals indicates that.

360. *Professor Gutteridge:* Some of these things have been invented by government servants, have they not? Was not the paravane invented by a member of His Majesty's service?

Sir Eustace d'Eyncourt: The paravane was invented by Commander Burney, and it was developed, I think, in conjunction with Messrs. Vickers.

361. *Professor Gutteridge:* For our purpose he may be regarded as an employee of the State, I take it, at the time he invented the paravane?

Sir Eustace d'Eyncourt: Yes; but it was not his particular line. He was a naval officer.

362. *Professor Gutteridge:* You draw a distinction, do you?

Sir Eustace d'Eyncourt: He was in the sense of being a private person *vis-à-vis* the paravane.

363. *Professor Gutteridge:* Supposing you had a national system, what would you have to do in order to provide for this adequate reserve of skilled men? Have you ever considered that question?

Sir Eustace d'Eyncourt: I think it would be very difficult. I think they would always have to draw on private sources when an emergency arose. You would have to get skilled men from outside; there would not be enough otherwise.

364. *Professor Gutteridge:* There are certain trades available at once in time of war, are there not? I believe that watchmakers can be used for some of the more delicate work on gun sights, and that sort of thing?

Sir Eustace d'Eyncourt: Yes, I dare say. Motor-car people, of course, are very useful, but in time of war probably they are wanted for making more motor cars.

365. *Professor Gutteridge:* You mean there may be a shortage?

Sir Eustace d'Eyncourt: There would be a shortage, I am sure.

22 May, 1935.]

SIR EUSTACE HENRY TENNYSON D'EYNCOURT, Bart., K.C.B.

[Continued.]

366. *Professor Gutteridge*: I am asking you these questions because what is troubling me is this: How would it be possible under a national system to maintain this reserve?

Sir Eustace d'Eyncourt: I think it would be very difficult to maintain a reserve of highly skilled people. It would want considering.

367. *Sir Philip Gibbs*: When you say you advocate the private manufacture of armaments, I imagine you are looking at it mainly from a technical point of view; you are not considering at all the moral side of the question and the alleged abuses of private manufacture and private traffic in arms?

Sir Eustace d'Eyncourt: No.

368. *Sir Philip Gibbs*: You have left that entirely out of your consideration.

Sir Eustace d'Eyncourt: Yes; but, of course, I have had considerable experience in trying to get orders for warships, and so on, in foreign countries.

369. *Sir Philip Gibbs*: Do you agree that there are abuses with regard to the private traffic?

Sir Eustace d'Eyncourt: I have not come across any in going to foreign countries for orders, with which I have had considerable experience. I always found that the foreigner knew what he wanted—he wanted to get a better ship, or gun, or whatever it was, than his neighbour and potential enemy, and that was all that he thought about. There was never any inducement from any firm that I represented to try and make him go to war, or anything of that sort.

370. *Sir Philip Gibbs*: You did not find it necessary to indulge in a little "backsheesh"?

Sir Eustace d'Eyncourt: Personally, no.

371. *Sir Philip Gibbs*: Or your agents?

Sir Eustace d'Eyncourt: It is rather difficult to speak about all the agents. It is rather difficult to define "backsheesh," I think, too.

372. *Sir Philip Gibbs*: Let us say friendly presents?

Sir Eustace d'Eyncourt: I really did not come across anything of that kind myself.

373. *Sir Philip Gibbs*: I see you lay very great stress on efficiency and on inventive genius with regard to arms, and I want to ask you one or two questions on that point. I was wondering, for instance, whether you would agree that high efficiency in the production of destructive weapons is apt to lead to dangerous competition with other countries who naturally want to keep pace with new inventions. Do you think that does in fact lead to international competition?

Sir Eustace d'Eyncourt: Everyone wants to get the best, and we do not want to be left behind, I take it.

374. *Sir Philip Gibbs*: But do you think perhaps that inventive genius applied to destructive weapons is rather double-edged in its effect, and that any invention made in this country is very quickly imitated by foreign nations?

Sir Eustace d'Eyncourt: Yes. I think everyone tries to get the best, whether from their own sources or from learning from the foreigner or whoever it may be.

375. *Sir Philip Gibbs*: I imagine you would agree that the intensive progress in the science of slaughter has been adopted by the world generally and not by one nation; that is to say, you see a steady progress in the efficiency of weapons throughout the world?

Sir Eustace d'Eyncourt: Yes. It is not always the progress in slaughter; there is protection as well, for instance, armour, and so on.

376. *Sir Philip Gibbs*: Do you think it is more likely that private firms would pass on their patents of new inventions to foreigners, or do you think it would be more probable that they would pass on their inventions under a national system?

Sir Eustace d'Eyncourt: No, I should not think so. Surely government control could stop anything of that sort.

377. *Sir Philip Gibbs*: But do you think they are stopping it?

Sir Eustace d'Eyncourt: Of course, as a matter of fact, any invention which is brought out, or any patent, very soon becomes public property, universally almost. In fact, some of the most secret and confidential and important things are not patented, on account of the mere fact that if they are patented the nature of the invention is published.

378. *Sir Philip Gibbs*: I imagine that private firms, if they do produce a new invention, do go about trying to sell it to other countries?

Sir Eustace d'Eyncourt: Of course, inventions which are submitted first to our own departments—the War Office, the Admiralty, or whatever it is—can be made absolutely confidential; there are confidential patents which the inventors have not been allowed to publish.

379. *Sir Philip Gibbs*: Take the aeroplane manufacturer; surely a firm like Handley Page would have a perfect right to sell its patent to foreign countries?

Sir Eustace d'Eyncourt: Yes, I dare say.

380. *Sir Philip Gibbs*: From your experience, would they be under any obligation to sell them solely to the British Government?

Sir Eustace d'Eyncourt: No, I do not think so, not unless it is made a confidential matter, and he is sworn not to divulge it to any foreign country.

381. *Sir Philip Gibbs*: Has the government the right to impose that obligation upon a firm?

Sir Eustace d'Eyncourt: I think the government has a right to do that about any invention, and I think the people are patriotic, too.

382. *Sir Philip Gibbs*: Would not you agree that in general practice these private firms are not under any such obligation, and do not regard it as any sort of moral defect on their part to sell their patents to foreign countries?

Sir Eustace d'Eyncourt: No. I think that any British firm would keep for its own country anything of real value, particularly if requested; apart from any definitely legal obligation, it would keep it within the country and not sell it abroad.

383. *Chairman*: It must depend upon the firm, I suppose?

Sir Eustace d'Eyncourt: Yes.

384. *Chairman*: Some firms would do whichever paid them the best; other firms might do the patriotic thing?

Sir Eustace d'Eyncourt: Yes, possibly.

385. *Sir Philip Gibbs*: Take, for instance, a firm like Vickers, which has many international affiliations; would not it be necessary for them to pass on any secret of manufacture to their other companies?

Sir Eustace d'Eyncourt: Oh, no, not necessarily.

386. *Sir Philip Gibbs*: Do you think it is likely that they would do so?

Sir Eustace d'Eyncourt: I could hardly say; I am not a minor prophet.

387. *Sir Philip Gibbs*: This is within your own knowledge. Have these inventions been sold in the past to foreign firms?

Sir Eustace d'Eyncourt: Certain inventions have become available for foreigners, no doubt; and all inventions become available; it is only a question of time.

388. *Sir Philip Gibbs*: You see, the point that I am driving at, and I think it is rather an important point, is this: that inventive genius applied to arms is perhaps a double-edged weapon; because as quickly as any new invention is adopted, or some superiority obtained, by one country, it is immediately countered by a foreign nation. For instance, I should like to ask you whether that did not happen with regard to the Dreadnoughts? Were you one of the designers of the Dreadnoughts?

Sir Eustace d'Eyncourt: No. I was not at the Admiralty then; Sir Philip Watts was the

22 May, 1935.]

SIR EUSTACE HENRY TENNYSON D'EYNCOURT, Bart., K.C.B.

[Continued.]

Director of Naval Construction when the Dreadnoughts were designed.

389. *Sir Philip Gibbs*: Do you agree that when we decided upon the Dreadnought type, that was instantly countered by Germany building big ships, and our superiority really did not exist for more than a very short time?

Sir Eustace d'Eyncourt: I think that applies to everything. You can only get ahead for a limited time.

390. *Sir Philip Gibbs*: Does not that rather lead to the conclusion that this progress in arms is not really valuable to any country?

Sir Eustace d'Eyncourt: Of course, if you went back to the original base you would get back to bows and arrows and that sort of thing.

391. *Professor Gutteridge*: I have heard it said that if the British army had been armed with the long bow at Waterloo the defeat of the French would have been even greater than it was, because the range of the long bow was so much greater than that of the Brown Bess.

Sir Eustace d'Eyncourt: We beat them, anyway.

392. *Sir Philip Gibbs*: With regard to the tanks, of which you were one of the designers, I imagine that most countries now have some form of tank?

Sir Eustace d'Eyncourt: I imagine so—all the progressive ones.

393. *Sir Philip Gibbs*: Based on our own experience and models?

Sir Eustace d'Eyncourt: Probably.

394. *Sir Philip Gibbs*: There, again, you see that our invention of the tank, which was very helpful for a short time, might not be at all helpful to us if we have another war; it only intensifies the destructiveness of all nations?

Sir Eustace d'Eyncourt: If the Germans had been six months ahead of us they would have won the war with tanks—if we had not had them. That is the whole point. You have just got to get ahead. It is like breeding racehorses; you have just got to win the Derby by a little bit.

395. *Sir Philip Gibbs*: I imagine that applies more to countries in a state of war than in a state of peace; that is to say, the superiority is enormously valuable if you can get it when you are actually at war?

Sir Eustace d'Eyncourt: Perhaps so.

396. *Sir Philip Gibbs*: But it is more difficult when you have adopted the invention before war?

Sir Eustace d'Eyncourt: Right through peace and war you have to keep up the whole idea of keeping the initiative in invention, in my opinion.

397. *Sir Philip Gibbs*: I will just ask you one final question on the same point. Do you think that it is really an advantage to one country to keep on increasing the efficiency and destructiveness of its weapons?

Sir Eustace d'Eyncourt: Certainly, *vis-à-vis* other countries.

398. *Sir Philip Gibbs*: That is to say, you must always be striving for superiority?

Sir Eustace d'Eyncourt: Yes.

399. *Professor Gutteridge*: It is sometimes said that there are certain advantages in selling armaments to foreigners; for instance, I have heard it said that by selling armaments we obtain knowledge of what they are doing. Do you agree?

Sir Eustace d'Eyncourt: Yes, we do, no doubt.

400. *Professor Gutteridge*: I suppose if we sell warships to a particular country we know what we have to meet in time of war?

Sir Eustace d'Eyncourt: Yes, certainly. You find out what they are doing.

401. *Professor Gutteridge*: Do you regard that as an advantage?

Sir Eustace d'Eyncourt: Yes, I certainly do; and, of course, the fact of building warships for a foreigner gives us the advantage of having in our possession the warships that are building. When the war began we took four battleships for which the British taxpayer had not paid a penny; we were able to take them over and they became an asset to us in the war.

402. *Professor Gutteridge*: Were those the Turkish vessels?

Sir Eustace d'Eyncourt: Two Turkish.

403. *Professor Gutteridge*: And two Chilean?

Sir Eustace d'Eyncourt: Yes. I think there were also some smaller ships, too.

404. *Professor Gutteridge*: Your work has been on the constructional side, has it not?

Sir Eustace d'Eyncourt: Design and construction.

405. *Professor Gutteridge*: You are not familiar with the ordnance side, are you?

Sir Eustace d'Eyncourt: Of course, incidentally, one has a good deal to do, certainly, with the bigger gun mountings, and so on.

406. *Chairman*: There is one question I wanted to ask you, and there are two questions that I have been asked to ask by representatives who are here listening to what is going on. *Professor Gutteridge* has raised an important point about maintaining an adequate reserve of skilled men. Assuming that nationalisation of armaments was accepted and adopted, the nation would then desire, I dare say, to keep its plant efficient and to provide sufficient work to keep their men skilled, and would wish also to provide opportunities for training the young men to come on and become skilled men?

Sir Eustace d'Eyncourt: Yes.

407. *Chairman*: If that is so, do you think that the governments who were making arms would be likely to become themselves traders in arms in order to keep their plant and their men, and so forth, efficient? Do you think there is a danger of that, because in peacetime I assume the amount of work which would be required to be done in a national factory would be relatively small?

Sir Eustace d'Eyncourt: Yes, no doubt. That is one of the points, incidentally, which I wanted to make; that by placing government orders where the very highest class of material is required, and the greatest skill is spread widely through the country, you have a heaven of the greatest skilled men everywhere, and if they are in private works their skill can be used for civilian and private work during the time when they are not actually doing the war material for the government—they can do the highest class of work for civilian purposes.

408. *Chairman*: The two questions I have been asked to put to you, and I am quite prepared to put them, are these: Whether you consider that the present private firms contracting for the Admiralty are independent, and whether in the true sense they are competitors for government orders, or are they closely interlocked?

Is there, for example, any connection between Vickers, and Brown, and Parsons—do you know whether there is any working connection between those firms?

Sir Eustace d'Eyncourt: No, I do not think so. In fact I am sure not. Of course, they know what the other firms are doing. For instance, Parsons, with which I am connected, make machinery for Vickers' ships, and we help to design the machinery on Brown's ships, and so on.

409. *Chairman*: I think that what the questioner wants to know is whether, in the event of a government order going to be placed, other firms put their heads together in order to fix a price instead of acting as competitors. I think that is the object of the question. Do you know anything about that?

Sir Eustace d'Eyncourt: No, I do not know anything about that.

22 May, 1935.]

Sir EUSTACE HENRY TENNYSON D'ENCOURT, Bart., K.C.B.

[Continued.]

410. *Chairman*: The other question is this: Could the witness amplify his statement with regard to the experience of armament firms during the war with regard to the ability of private firms to provide efficient personnel and equipment? It is common knowledge that there was a great deficiency of personnel and equipment amongst the private firms when once the enormous requirements of the country were realised. Is not that a fact?

Sir Eustace d'Encourt: Yes.

(The Witness withdrew.)

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P., and Captain the Hon. JOHN DE VERE LODER, M.P., on behalf of the League of Nations Union, called and examined.

413. *Chairman*: Will you give the reporter your full name, Major Hills?

Major Hills: My name is John Waller Hills; I am a Member of Parliament, and I served in the Ministry of Munitions in the war when I came home from the front wounded, and I also served on the Temporary Mixed Commission at Geneva which sat for three years, a sub-committee of which was appointed to consider the question of traffic, and another sub-committee on the question of manufacture. I did not sit on the manufacturing committee, but I was rapporteur of the traffic committee, and I myself drafted the report which formed the basis of the Convention of 1925, which is now before the nations for ratification and acceptance; and I think I may say that they largely took my draft, and that a large part of the present Convention is what I drafted.

414. *Chairman*: And you, Captain Loder?

Captain Loder: My name is John de Vere Loder; I am a Member of Parliament, and a member of the executive committee of the League of Nations Union, on one of whose sub-committees for investigating this particular question I have sat; otherwise I have not any specific connection with the armaments question. It is principally as a member of the Council of the League of Nations Union that I am here.

415. *Chairman*: Are you both members of the League of Nations Union?

Major Hills: Yes. May I add that I am Vice-Chairman, but I do not speak on behalf of the Committee.

416. *Chairman*: No; I understand that.

Major Hills: Lord Cecil has given that evidence.

417. *Chairman*: Lord Cecil told us that there was a difference of opinion amongst members of the Union, and that he represented one view, and I think you two gentlemen represent the other?

Captain Loder: Yes.

418. *Chairman*: I suppose there are a very large number of members of the Union, are there not?

Major Hills: I think about 400,000, or something of that sort.

419. *Chairman*: And there is this difference of opinion?

Major Hills: Yes.

420. *Chairman*: You have prepared a statement. Would you like to go through that statement and read it to us?

Major Hills: (reading) 1. Private manufacture is attacked on the practical ground that it encourages war and on the moral ground that it is wrong to make a profit out of killing. Nationalisation, by which we mean the system outlined by Lord Cecil of Chelwood, is proposed as the remedy for both. On the practical issue we consider that licence and control of manufacture and of traffic would at least do as much to prevent war as would nationalisation, and that it avoids the evils of the latter. We will deal with the practical issue first, and with the moral question afterwards.

411. *Chairman*: I assume that that is what is referred to. I mean, the private firms were unable to rise to the great emergency of the Great War?

Sir Eustace d'Encourt: Of course, they had not nearly all the plant which was necessary; but they had a good deal and they had the skilled men, and it was easier to develop their plant and teach the younger men to do the better class work, and so on.

412. *Chairman*: We are very much obliged to you, Sir Eustace.

2. *Manufacture of Arms: the American Plan.*—

For controlling manufacture, we suggest broadly what is known as the American plan, namely, the Articles submitted to the Disarmament Conference by the American delegation last year (Conf. D. 167). The Commission no doubt is familiar with this document, so we will only say that it would control manufacture by the three principles of licence, inspection and publicity. No arms could be made without a government licence. All manufacture and all sales and purchases would be matter of public knowledge. No arms would be sold except to a government whose name would be known, or in excess of what is allowed by a disarmament convention. All arms factories would be inspected periodically by members of a Permanent Disarmament Commission established at Geneva. The results of inspections, together with particulars of licences, sales and purchases, would be published. We assume that (in the absence of an international disarmament convention) the inspection would be confined to the verification of the returns furnished by the different governments.

This system must be accepted by the chief manufacturing countries, which are not many, in order to be effective. It could not operate if a substantial number of the producers were left out. It certainly would be useless for Britain alone to enforce it leaving the rest of the world free.

We regard international inspection (Chap. IV) as essential. Inspection by nations themselves would not give that confidence on which security depends.

3. *Control and Licence v. Nationalisation of Armament Factories.*—Nationalisation in Britain alone, while leaving the rest of the world free, would not help to prevent war, so that can be disregarded. Nationalisation must include all producing states. Now, if no arms are made except by governments, all nations—down to the smallest South American republic—must either start state factories of their own or come to some arrangement with a producing power for supply. As the world is, nations must be armed. The great majority of states would be in the second class, for they have neither the minerals nor the skilled direction nor the technical equipment necessary for so specialised a manufacture. They would come to an agreement with a producing power. Now, such a bargain must be two-sided. The producing power must be certain that the arms are never employed against itself or its allies; the importing power must be certain that it always gets the arms it wants, especially in the crisis of a doubtful war. It must also be sure that it is to be the judge whether arms are supplied or not, for it could not run the risk of being left in the lurch in its necessity. You would have restricted its power to buy from many sources. Therefore the bond between producer and importer must be close. Countries in the past have used supply of arms as a means of extending their sphere of influence. Whatever this country did,

22 May, 1935.]

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P.,
and Captain the Hon. JOHN DE VERE LODER, M.P.

[Continued.]

certain other countries would do the same in the future and to a much greater extent, since they had not to compete against private supply. In the end we submit that you would get a grouping of the world highly dangerous to peace, with powers that might be peace-breakers stretching their tentacles in all directions. Note, too, that in the case so often quoted, the war between Bolivia and Paraguay, this war might well be harder to put down under nationalisation than under controlled and licensed private manufacture. The producer-country which agreed to supply either belligerent would no doubt have made similar agreements, perhaps many, with other countries. It could not break faith with one without destroying the confidence of all. The supply of arms would have acquired almost the sanctity of a treaty. There would be strong pressure against deserting the importing country in its extremity.

Under the system of private manufacture such a war can be stopped more easily. It can be stopped to-day, if all producing countries agreed to prohibit the export of arms direct or indirect, to the belligerents. If it is objected that such agreement has proved impossible to obtain, and always would be impossible, the answer is that agreement would be equally necessary under nationalisation, and more difficult to get. If a country fails to do its duty by forbidding its nationals to export arms, it would hardly be more likely to act if it itself were the exporter. Moreover, as stated above, a supply of arms might be almost a matter of treaty right.

4. *Countries where all Production is Nationalised.*—There is one point to which we wish to draw attention because its importance seems to have passed unnoticed.

The assumption underlying the proposal for the nationalisation of arms manufacture is that trade in general is free. But there is at least one country where, even now, all production is in the hands of the government. Every factory therefore in that country would, under such a proposal, be a factory authorised to produce arms. But in other countries, our own included, where production and manufacture are still in private hands, only the government arsenals would be in the position in which every factory and shipyard would be in a country where all production is nationalised.

5. *Increase of State Factories.*—Coming to the second alternative mentioned in paragraph 3, compelling all countries who do not have state factories to start them, you would thereby actually increase the amount of arms made. States which do not now have factories would start them and it is difficult to see how this would help disarmament. State factories, perhaps a popular and lucrative employment, would be the hardest of all to abolish.

But there is a greater evil than that. Armament factories now do not make arms all the time. Possibly one-tenth of their output is arms, nine-tenths civil goods. But in this country at any rate a state factory would have to make arms and nothing else all the time. Public opinion would not allow an enterprise financed by government money to compete in building merchant ships or bridges or electrical plant or motor cars. Certain shipyards and certain factories would be set apart to make armaments and nothing else, and they would have to make more than private firms do now for this reason: all manufacturing countries have—we certainly have—an immense power of expansion in war time. We can convert our factories to war production because they have made arms in peace time. But expansion would be more difficult if all armaments had, for many years, been made in state factories and the art was lost in private factories. We suggest that

the result would be that a prudent War Office and Admiralty and Air Ministry would insist on bigger reserves of arms. This would not only cost more but could hardly tend to the peace of the world.

6. *Traffic in Arms.*—We advocate the American plan also for the control of traffic in arms. This brings up to date the earlier Convention of 17th June, 1925 (Command Paper 3448/1929); see Chap. III of the draft American articles. This is based on the principles of licence and publicity and prohibition of sale except to governments. No exports or imports could take place without a government licence, containing full particulars, which would be published. No sales would be allowed except to governments, or bodies authorised by them. Particulars would be given of all warships laid down and completed. Exports to territories under the sovereignty or tutelage of the exporter (e.g., the British Empire including mandated territories) are excluded.

7. *Solicitation.*—No doubt the public is deeply moved by the belief that armament makers persuade a country to arm and then go round and frighten its neighbours into arming also, and we do not disregard the evidence given before the Committee of the American Senate. But if nations were the only sellers, would they be more scrupulous than individuals? Some would, but whether all would is much more debatable. We have no evidence as to how far solicitation is used by armament firms in this country; but we suggest that nations arm not because they are solicited but because they are afraid. Solicitation admittedly may act on fear, but is not the primary cause of fear, and fear is the cause of armaments. Nations would arm, were there no solicitation whatever, until fear is removed. But putting solicitation at its most evil, and no one can feel easy about it, one way to meet it would be to add a clause to the American articles imposing the sanction of forfeiture of the licence to manufacture on proof of solicitation, which would be a heavy and we believe effective penalty. We may point out that the penalty of forfeiture of licence would not be applicable if governments were the only makers of arms.

8. *Disturbance of International Relations.*—It is said that solicitation by sellers of arms keeps the world in a state of permanent unrest. We do not presume to offer evidence on this head, for we have no first-hand knowledge, but we wish to make a comment. In Europe of to-day, where unrest is obvious, is this unrest the doing of Vickers or Krupps or Creusot or Skoda? Probably no one would say that their activities are the sole cause, and we find it difficult to believe that they are even a serious contributory cause. Surely the evils affecting Europe lie deeper than the activities of armament makers, however mischievous. But even if these are a contributory cause, it remains to be proved that nations if they were the only sellers would be less active in soliciting than are firms or companies.

9. *Summary of American Plans.*—All armament firms would be under direct government control (Arts. 2 and 3). No arms would be made except under licence (Art. 5). All licences, all orders received, and all arms made would be matter of public knowledge (Arts. 7 and 23). No export except to a government (Art. 10) and no export or import except under licence (Art. 8). All export and import licences would also be matter of public knowledge (Art. 23). All factories to be inspected by an international body (Art. 20 *et seq.*), the results of such inspection to be published (Art. 22).

No sanctions are attached to a breach of the convention, beyond publicity, that is, special international inspection and report (Arts. 27-29).

22 May, 1935.]

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P.,
and Captain the Hon. JOHN DE VERE LODER, M.P.

[Continued.]

10. *Weakness of Britain under Nationalisation.*—We do not prepare for war to the same extent as some countries. We rely on our power to expand. This is our traditional and commendable policy. This we should sacrifice if we adopted nationalisation. The fact that we have a large armament trade all over the world makes us strong for defence. Our potentialities are great and well known, and consequently we are less liable to attack.

11. *The Moral Issue.*—Possibly most people who object to private manufacture do so either because they think it bad that there should be capitalists and shareholders who profit by war, or because they consider it wrong to make money out of killing.

The first belief, the wish "to take the profit out of war" is partly a moral movement, but also practical, as it is believed that if war is profitable it will happen. This we think debatable; but it is obvious that the fewer the people who benefit by war the better for the world. That cannot be disputed. It is argued that so far as self-interest is a motive, nationalisation, by replacing private self-interest by corporate self-interest, might lessen its intensity. We doubt this; but even granting that it would, we consider that the evils of nationalisation greatly outweigh its advantages.

The second belief, that it is wrong to make money out of death, is widespread. We know it is held by people of high character, for whom we have the greatest respect, and we do not overlook the necessity of dealing with it. We venture, however, to make two observations. Assume all manufacture nationalised, some sales have to be made to non-producing countries, and if these are made at a profit, as they certainly would be, the selling country is profiting out of death. If private action is indefensible, corporate action is no less so; and yet sales must be made or else the unfortunate non-producing countries will be at the mercy of their producing neighbours. Nor would the world be better if Britain alone refused to supply, and left the trade to countries who might be regarded as less scrupulous. That is our first answer, but perhaps a stronger answer is this. Profit in arms may be wicked, but the problem before statesmanship is not one of general rectitude, but how to make the world more peaceable. Before nationalisation is adopted it must be proved that it means peace. We have shown why we think it fails on the practical issue. And for ourselves we cannot see that it even solves the moral difficulty.

421. *Chairman:* You have put your case very plainly, if I may say so. But there is one passage that I do not quite follow, and perhaps you will explain to me what exactly it means. In paragraph 3 you say: "Therefore the bond between producer and importer must be close"—then you go on to say:

"Countries in the past have used supply of arms as a means of extending their sphere of influence. Whatever this country did, certain other countries would do the same in the future and to a much greater extent, since they had not to compete against private supply."

I do not quite follow what you are driving at there.

Major Hills: The argument is that certain countries in Europe after the war have used their supply of arms to make political alliances—say France and Poland—and if they had held the sole supply in their hands and had no competition to meet from private sellers, would not that power, which I regard as a very questionable and dangerous power, operate to a greater extent?

422. *Chairman:* Then, in paragraph 4, you say:

"The assumption underlying the proposal for the nationalisation of arms manufacture is that trade in general is free. But there is at least one country where even now all production is in the hands of the government. Every factory therefore in that country would, under such a proposal, be a factory authorised to produce arms. But in other countries, our own included, where production and manufacture are still in private hands, only the government arsenals would be in the position in which every factory and shipyard would be in a country where all production is nationalised."

I do not see how you arrive at the statement that trade in general is free.

Major Hills: In this country, Sir, if all the making of arms is nationalised, certain factories would be armament factories, but the ordinary private factories all over the country would not be armament factories. In a country where all manufacture is governmental, every factory would be an armament factory, and that would put that country under an advantage, and would make inspection practically impossible. Take a big and widespread country—I think you know the country that we have in mind, Sir—with factories all over it, all government factories, they could make arms or anything else, and they might offer to open them for inspection, but it would take years to get round and inspect them, and they would have, on the practical side, a potentiality of manufacture which gave them the advantages of government and private manufacture in one, against another state which left the rest of its productive capacity free, and could only make arms in government factories.

423. *Chairman:* Now have you considered this question: assuming nationalisation to be adopted, if would follow from that, would it not, that there would be no export by private firms of arms manufactured by themselves; but under nationalisation, a government might employ private firms to manufacture for them, and in that case they would be government factories.

Major Hills: You would distinguish, Sir, between a nationalised factory and a factory employed by the government?

424. *Chairman:* Well, I was asking you whether there really would be any distinction.

Major Hills: I take it that you could not have a complete system of nationalisation unless the factories, whether they were national or agents of the government, were confined to the making of arms.

425. *Chairman:* But is that necessary for a complete system of nationalisation? Nobody could export arms from the country except the government. Does it cease to be a nationalised system because the government employs private firms to make, we will say, parts of armaments or entire guns or entire aeroplanes? Does it cease to be nationalised in the sense in which we are using nationalisation as opposed to private manufacture?

Major Hills: I understood that Lord Cecil applied nationalisation to start from the first process at which the raw material is differentiated for arms purposes compared with civil purposes. If the government gave that final process to Vickers, or Armstrong's, or John Brown, or the Coventry Iron Works, would not that be a system of licensing private manufacture, and not a system of nationalised manufacture?

426. *Chairman:* Well, that remains to be decided by somebody. Assuming again a system of nationalisation to be established, do you think there would be any danger of the private firms at present manufacturing in the country where nationalisation is established, removing their works to a country which is not nationalised, or entering into working agreements with a firm in a country which is not nationalised? Could that be prevented in any way?

Major Hills: I think that is very probable, Sir. I think the big firms that had got skilled men and

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P.,
and Captain the Hon. JOHN DE VERE LODER, M.P.

[Continued.]

a history of armament-making behind them would start factories in some country where armaments were not nationalised; but may I respectfully suggest that the answer is an international treaty, whether it is for nationalisation or for the American plan—that it must extend over all the main producing countries if it is to be effective.

427. *Chairman*: How, under nationalisation, do you think that the manufacture of aeroplanes could be dealt with? We were told by one witness that there was no possible way except the state taking over the whole of the manufacture of aeroplanes. Have you considered the question?

Major Hills: I do not really think that the principle of confining national factories to the last process that differentiates the material from its civil purposes is very effective. I think you would find that except for the processes like the making of the steel, the differentiation starts very low down in the manufacture; but of course I have no technical knowledge whatever, and I believe that with regard to aeroplanes, certainly the differentiation between the civil and the military is increasing every year—and the actual difference is increasing every year—and it may approximate in time to the difference between a merchant ship and a battleship. I venture to think, though it is only my own personal opinion, that you would have to set apart certain factories for the exclusive manufacture of military aeroplanes. I think they are so different from civil machines.

428. *Chairman*: Captain Loder, would you like to say anything in addition to what Major Hills has said?

Captain Loder: No, thank you. I agree entirely with what Major Hills has answered, and the statements he has made.

429. *Dame Rachel Crowdy*: As you know, Major Hills, in Geneva I had a good deal to do with the drafting of the various opium conventions.

Major Hills: Yes, I know you had.

430. *Dame Rachel Crowdy*: I have been much struck with the likeness between the American draft convention and the International Convention of 1931 for the control of dangerous drugs. There is one great difference between them however, I can find nothing in the disarmament scheme which deals with limitation. There is inspection, of course, and there is publicity, as you say. There is no reference to limitation. There is a clause in the Opium Convention which limits manufacture to medical and scientific purposes.

Major Hills: Yes.

431. *Dame Rachel Crowdy*: I quite see that a clause of such a kind could not be applicable to armaments, but do you believe that a tightening up of regulation, and a strictly applied license system, as you suggest, is any good at all unless limitation of some kind goes with it?

Major Hills: No system is any good without limitation of arms, either nationalised or controlled private manufacture. It is the essential condition, and if I may add this, the American draft articles proceed on the basis of a disarmament convention.

432. *Dame Rachel Crowdy*: You, I gather, are in favour of private manufacture continuing, given strict control and an efficiently applied licensing system, rather than that a scheme of nationalisation should be adopted?

Major Hills: Yes.

433. *Dame Rachel Crowdy*: If you continue to have private manufacture on any lines, even licensed and controlled private manufacture, are not you still going to have all the disadvantages which go with business methods?

Major Hills: Yes.

434. *Dame Rachel Crowdy*: You are bound to go on having bribery; you are bound to go on having

touting for orders; you are bound to go on having combines with selling commissions?

Major Hills: Yes.

435. *Dame Rachel Crowdy*: How are you going to get past all that if you continue private manufacture? I should very much like to hear your development of that if you would be good enough to give it.

Major Hills: I quite see the evils that Dame Rachel is driving at, and I recognise them fully. I suggest that if you have complete publicity as to where the armaments go to, and you know, at any given moment, what arms each country is getting, the basis for solicitation and frightening another country into arming would disappear, or anyhow would be lessened; and again, if you had a disarmament convention, and no country could possess more than certain arms, and all those arms were known, solicitation could only take place up to the limit allowed in that convention; it would be a very different solicitation from what exists in an uncontrolled armed world. My third point is that I do not trust governments as much as some people do. I do not believe for one moment that our Government would go and solicit, but I could name some governments that I am pretty sure would go and solicit. I do not think you get very much more righteousness by calling it a government than you do by calling it private individuals, over whom you can keep a much stronger check. Lastly you can forfeit the licence of a man that solicits, and he has no say; it is gone; his trade is done away with, if he solicits. But take a government that solicits; we know that you cannot indict a nation; how do you punish that government? You cannot. You have lost control. A very big part of your control is gone; because, if the private firm breaks out, a government would be very slow to defend the iniquities of its private nationals, but if its own actions were challenged, it would refuse to plead, and you would get a very nasty position.

436. *Dame Rachel Crowdy*: I can think of a case at the moment on which I should like your comments, a case I came across myself. Suppose this system you suggest were in operation, and you believe solicitation can be stopped to a very great extent by governments, how would a case like this be dealt with: Three months ago, in Manchuria, I talked casually to a man in a hotel and asked him what his job was in Manchuria at the moment. He said: "Well, I have just come. I represent such-and-such a firm in the United States"—whose name I will not give because I have already given it to Senator Nye, and it is his business, not ours—he said: "I have just come from Afghanistan, where I have sold"—his exact words were—"where I have induced them to buy twelve tanks." Now, how are you going to follow up solicitation of that kind? The man is working from Manchuria and he has been doing his touting in Afghanistan, among the tribes. Now, how would you cope with that type of thing, which would probably not be done by a government, but which would be done by a private firm?

Major Hills: Yes, I quite accept that that is a common state of things. I suggest that that man's employers would have been less ready to send him out to solicit if they had known that their business was imperilled; and would it be quite impossible that that man should be the representative of some government, and that they were selling to the Japanese and to the Chinese?

437. *Dame Rachel Crowdy*: This actual man, you mean, or any other?

Sir Philip Gibbs: This actual man.

438. *Dame Rachel Crowdy*: This actual man was with one of the big private firms of the United States, and when I commented on this to some of the members of the Commission in Washington, I was told that that was very interesting, because there

F

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P.,
and Captain the Hon. JOHN DE VERE LODER, M.P.

[Continued.]

was a record of tractors having been manufactured and sent abroad; but there was no mention of tanks.

Sir Philip Gibbs: They were, I suppose, actually tanks?

439. *Dame Rachel Crowdy:* They were actually tanks according to this man, who told me merely because he was interested in a job he had pulled off.

Major Hills: We all want the same thing, and I quite see that if you can rely on nations to act more rightly than individuals on the solicitation side, there is a very strong case; but my experience of the world does not confirm that. I am not sure that you could. Just look at what is happening in Bolivia and Paraguay. There you have a certain country, who shall be nameless, breaking what was an agreement and still exporting arms.

Captain Loder: Might I intervene, Mr. Chairman, to elucidate that point?

440. *Chairman:* Yes, by all means.

Captain Loder: It has only just occurred to me that under nationalisation it would be a temptation to governments to keep their armament factories working at full time; that you might get, in an example of this kind, exactly the same kind of agent going to a country like Afghanistan on behalf of the government as you do on behalf of a private firm at the present time.

441. *Dame Rachel Crowdy:* Would not that be rather less likely because, after all, diplomatic relations in such circumstances might be endangered between governments? This would not enter into the question between private firms.

Major Hills: I wonder.

Captain Loder: I have doubts; but of course that must be a matter of opinion.

442. *Mr. Spender:* Would you not agree, Major Hills, that this business of solicitation under various forms has been a part of diplomacy for generations past?

Major Hills: The private sale of armaments?

443. *Mr. Spender:* Not the private sale. The point I want to get at is this. You suggest that it will be aggravated by nationalisation.

Major Hills: Yes.

444. *Mr. Spender:* I suggest that it has been a chronic source of difficulty for a great many years past. For instance, as we all know, governments are very anxious that certain other governments should accept loans from them, and it is a very frequent condition that the loans shall be spent on armaments in the country of the lender. That is true, is it not?

Major Hills: Yes. I think our record is rather better than that of the rest of the world. For instance, the Trade Facilities Act, which allows loans for the purpose of encouraging the export of British manufactures, excludes armaments. And I do not think that we use our diplomatic representatives, if at all, to the same extent as some countries do; but I speak only from general knowledge.

445. *Mr. Spender:* I am not suggesting it is practised by the British Government; I only suggest, as a general statement, that if you look at the diplomatic records of Europe before the War, this was one of the great weapons, the offer to another country, even the persuasion of another country, to accept a loan on condition that it spent it on armaments in the lending country.

Major Hills: Yes, I have heard that stated, but it is not a thing that is made public, usually, and I cannot say.

446. *Mr. Spender:* You will find it in German and Austrian documents. I think you will find a good deal of evidence of it. Then with regard to the arms supplied by one country being used against it, is not that a sort of perennial possibility? It is a gamble all the time. In the South African War the arms we supplied were used against us.

Major Hills: I cannot say. I think it is quite possible.

447. *Mr. Spender:* The Turks, for instance, in asking us to construct battleships for them, certainly had a case for saying that they were left in the lurch when we took the battleships on the eve of the War. I am only suggesting that these are not necessarily incidental to one policy or another, that they belong to nearly all policies.

Major Hills: Would not the position be different if the government themselves were the sellers? No doubt Armstrong's were making a battleship for the Turks when war broke out, and if the War had been postponed for the time that was required to complete that ship, the ship would have been on the other side, I quite agree; but in the case of governments agreeing to supply, would not they make a bargain with the country that the arms were not to be used against themselves or their allies, and would not that, in the end, produce a grouping of the world that would be very dangerous to peace?

448. *Mr. Spender:* Do you think it would be possible for any country to make such a bargain? I mean, it would be quite possible on paper, but do you think there could be any certain guarantee in the very uncertain politics of the world, as they have been, that the armaments supplied would not be used against the supplying power, or that that provision could be enforced?

Major Hills: No. I think it would take the form of political advantages, or a political alliance, in return for a supply of arms.

449. *Mr. Spender:* In fact, everybody would take the chance. They would hope, but they would take the chance. You would get the order for the supplies of armaments, and you would take the chance that the country you supplied would, if war broke out, be either your ally or on friendly terms with you. It is a gamble all the time, is it not? I mean, it is a chance, with governments or private firms, or whatever system there was; there would always be these chances that the arms supplied by one country, whether by government or by private firms, might be used against that country if it came to war. Is not that so?

Major Hills: I agree it is possible, but I think the country that entered into that sort of contract, the producing country, would make every effort to prevent its happening.

450. *Mr. Spender:* You said that everything depended on international agreements. Do you mean that nothing could be done by this country single-handed?

Major Hills: Single-handed? Well, Sir, I see great difficulty. The Convention of 1925 was submitted 10 years ago, and it comes into force if, I think, nine chief producing countries ratified it. We have always expressed our willingness to ratify if certain other countries ratified, and that has never been done, for the reason that if we ratify—and we restrict ourselves in that case—in that case it would simply mean that we opened a door which somebody else used, and unless the Commission think the thing ought to be done away with at all costs, which is a view I know is widely held, I think we should do more harm than good for peace. I do not think that we should increase the peace of the world if we, who do take some means to see that arms do not get into the wrong hands, were to say that we would nationalise all factories and control all export—if we alone did that, and other countries were less particular.

451. *Dame Rachel Crowdy:* Certainly in connection with the drug traffic we found that very strict supervision by governments, and very strong policies of control proposed by different national governments, was what led ultimately to international agreements.

Major Hills: Yes.

452. *Dame Rachel Crowdy:* Therefore, what one country does may bring about concerted action?

Major Hills: Yes, that is so; and we do possess a licensing system now. You cannot take a sporting rifle abroad without a licence for it.

22 May, 1935.]

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P.,
and Captain the Hon. JOHN DE VERE LODER, M.P.

[Continued.]

453. *Dame Rachel Crowdy*: It would depend on how strict that licence might be, and how strictly applied?

Major Hills: Yes.

454. *Professor Gutteridge*: If I understood you aright, what you are afraid of, when you talk about grouping, is this, is it not, that non-producing countries would tend to have a big brother who would supply them with arms as and when they required them?

Major Hills: Yes.

455. *Professor Gutteridge*: And that you might get the countries of Europe grouping in such a way as to make it very difficult to get collective security?

Major Hills: Yes; I think you damage the collective system.

456. *Professor Gutteridge*: Now I forget: are you representing the League of Nations Union, or are you here in your own individual capacity, you and Captain Loder?

Major Hills: Captain Loder and I are giving our own individual views. We have consulted one prominent member of the Executive as well, but except for that, we have consulted nobody.

457. *Professor Gutteridge*: Anyhow, you know there are two pamphlets, published by the League of Nations Union, which are known to us as No. 347 and No. 359?

Major Hills: Yes, I know them.

458. *Professor Gutteridge*: One of them contains an outline of a scheme; I think Colonel Carnegie told us that he had originated it. Are you familiar with that scheme?

Major Hills: Yes.

459. *Professor Gutteridge*: Would you give me your views on that? Do you support that scheme?

Major Hills: He has produced more than one scheme—a scheme that I have in mind was one supporting internationalisation of armament factories, that they were not to be considered as inside a state, but all were to be grouped into one.

460. *Professor Gutteridge*: That is not the one I mean—the one that provides for selling boards.

Major Hills: And the other was a national board.

461. *Professor Gutteridge*: That is the one.

Major Hills: A national board which should receive the orders and allot them to the different factories. Well, I think that is extremely difficult. You would get then, I suppose, competition between the different national boards. Each board would naturally try to get trade for its country, and I am not sure that you would get anything better than you have now.

462. *Professor Gutteridge*: You think we would still have touting.

Major Hills: I think some countries would still solicit.

463. *Professor Gutteridge*: You do not think there is any way of getting rid of the difficulties which arise from solicitation by having a national selling agency from which all armaments had to be sold? Have you applied your mind to that problem?

Major Hills: Yes. I have considered this problem for the last fourteen years, and we have gone round and round and round it, and we have always come back to two ways—either nationalisation or control of manufacture.

464. *Professor Gutteridge*: You think there is no intermediate?

Major Hills: I do not think you get any advantages by any intermediate.

465. *Sir Philip Gibbs*: I imagine that when you advocate the private manufacture of arms, you associate that with a very rigid licensing system.

Major Hills: Yes.

466. *Sir Philip Gibbs*: That is to say that you are broadly in favour of the American proposal for inspection.

Major Hills: Entirely.

467. *Sir Philip Gibbs*: And licensing.

Major Hills: Yes.

468. *Sir Philip Gibbs*: Now, if there were an international agreement on that point, I imagine that the licensing system would be quite severe—that is to say, that it would check the touting for supplies of arms from private manufacturers to other countries, and it would tighten up the general supply of arms to the world. Do you agree with that?

Major Hills: Yes.

469. *Sir Philip Gibbs*: Now, if that happened, would it not have the effect of so restricting the output of the private firms that it would really amount to reducing them to the position of manufacturers for their own governments?

Major Hills: Well, I wish I could think the world would be so peaceful.

470. *Sir Philip Gibbs*: You do not think an international agreement would insist upon that reduction, and the prevention of the free traffic in arms?

Major Hills: Well, may I say that those firms that were licensed would go on with their civil business just the same as before, but their armaments business would depend on the amount that the world was armed?

471. *Sir Philip Gibbs*: Yes; but would not the international agreement restrict that demand?

Major Hills: You mean a disarmament convention?

472. *Sir Philip Gibbs*: I am talking purely of this international agreement for the prevention of the abuses in the traffic in arms, not of disarmament.

Major Hills: I think it would. I think publicity alone would put down a great many of the evils of the forced sale of arms.

473. *Sir Philip Gibbs*: Do you think that private manufacturers would be able to exist under such a system?

Major Hills: I think it would mean that Vickers, and the other armament factories, would incline more and more to peace products, and that a smaller proportion of their business would be arms.

474. *Sir Philip Gibbs*: And you would be in favour of that, of course?

Major Hills: Oh, yes.

475. *Sir Philip Gibbs*: May I suggest to you that probably, without desiring it, in your attack upon nationalisation, you tend throughout this statement which you have given us, to minimise the abuses of the private manufacture of arms?

Major Hills: It is not intentional.

476. *Sir Philip Gibbs*: I thought it was not, but as a matter of fact in many of your phrases you suggest that the public opinion which is so hostile to the private manufacture of arms has been misinformed.

Major Hills: No, I do not think that for one minute. All I do venture to think is that the peace question is a different thing from the moral question. No, I do not in the least think that. I entirely respect the man who says: The thing is evil; do away with it.

477. *Sir Philip Gibbs*: Yes, but in many of your phrases you rather suggest that these evils are really not so great as people imagine, and that you personally do not believe in them.

Major Hills: Oh, I know they exist; I know these evils exist, and I want to put them down.

478. *Sir Philip Gibbs*: I think perhaps it is because, in disagreeing with nationalisation, you rather tend to stress that aspect.

Major Hills: I accept the correction, Sir.

479. *Sir Philip Gibbs*: There are one or two phrases I should like to question you about. For instance, there is one towards the end of your statement, in which you say: "The fact that we have a large armament trade all over the world makes us strong for defence." Now what I would like to put to you

22 May, 1935.]

Major the Rt. Hon. JOHN WALLER HILLS, P.C., M.P.,
and Captain the Hon. JOHN DE VERE LODER, M.P.

[Continued.]

is this. Does not it also make other countries strong for offence?

Major Hills: Yes.

480. Sir Philip Gibbs: You agree with that?

Major Hills: Yes. May I just add one word. I do not believe in isolation. I do not believe that being strong for defence is enough.

481. Sir Philip Gibbs: No; but the point of my question was this. You say: "The fact that we have a great armament trade all over the world makes us strong for defence," but my point really is this—it is not a question of isolation—that we are selling to all the other countries in the world who may be our potential enemies. Do you agree with that possibility?

Major Hills: Well, we have an immensely skilled and expandable industry.

482. Sir Philip Gibbs: You call it a trade, you know.

Major Hills: And if the crisis of war came, we should find that the fact that we had sold all over the world, and perhaps armed potential enemies, was counterbalanced by the fact that we had this enormous and very valuable power of expansion.

(The Witnesses withdrew.)

Mr. WILLIAM ARNOLD-FORSTER, on behalf of the National Peace Council and associated Organisations, called and examined.

487. Chairman: Mr. Arnold-Forster, I think that you, on behalf of a very large number of organisations, have presented a full statement* to us, and in addition you have supplied us with a statement which is rather more a statement of your own; that is so, is it not?

Mr. Arnold-Forster: May I explain, Sir. The memorial submitted to you has been formally endorsed by the twenty-six organisations whose names are subscribed to it. The statement I submit to you is one based scrupulously on the memorial; it represents my views, but I believe it represents also exactly the views of all those organisations, and my statement will purport to represent their view, substantially, with the reserve that I shall make in submitting it.

488. Chairman: Do you think it would be convenient that you should adopt the course that other witnesses have adopted, and read your statement?

Mr. Arnold-Forster: I should like to do so.

489. Chairman: Very well. Have you any special connection with armaments or armament manufacture, or are you connected with the Association whose memorandum we have been supplied with?

Mr. Arnold-Forster: I am adviser to the National Peace Council, which federates many Peace Organisations in this country; also a member of the Executive of the League of Nations Union. I was during the war a naval officer in the service of the Admiralty, and had a position on the Admiralty's behalf on the Contraband Committee at the Foreign Office, and in other Departments afterwards, and also at the Peace Conference in 1919. I have been secretary to Lord Cecil, and have been in government service as secretary to Lord Cecil and Lord Parmoor, in that capacity attending at Geneva in 1929 and 1930, and I have had opportunities of seeing a good deal of the Disarmament Conference there as an observer for the peace movement here.

490. Chairman: Thank you. Then perhaps now you would like to take your statement, would you?

Mr. Arnold-Forster: Thank you.

The Commission has already received, at its previous session, some impressive indications of the strength and extent of the public demand for effective action to deal with the evils of the arms trade as now conducted. To-day I bring you further evidence of this demand. The memorial transmitted to you from the National Peace Council, and which will be the basis of my statement, has the endorsement of no less than twenty-six organisations, some of which are nation wide in scope and

483. Sir Philip Gibbs: I think that rather suggests that we are selling arms—you suggest it in this statement—to other countries, but that we reserve to ourselves a possible superiority. Do you think that is actually the fact?

Major Hills: Well, I should regard that country as strong for war which had a big arms industry. I am talking entirely of strength for war, now, that although even some of those arms that it had made in the past did get into the hands of the enemies, I should regard that country as stronger to go through a war than the country which had not got that manufacturing capacity.

484. Sir Philip Gibbs: That power of expansion?

Major Hills: Yes.

485. Sir Philip Gibbs: And you do not think that would be possible under a nationalisation system—to maintain a potential superiority in production?

Major Hills: Yes, that is quite true. Yes, I accept that.

486. Chairman: I think that is all. Thank you, Sirs. We are much obliged to you for coming.

have a very large membership indeed. Amongst these organisations are:—

The Co-operative Union,
National Union of Teachers,
Union of Post Office Workers,
National Council of Women.

Spokesmen from these four bodies are with me to-day; and I submit the request that the Commission will be good enough to call upon these spokesmen to supplement my statement in due course.

The other organisations include the National Liberal Federation and the Women's National Liberal Federation. Mr. Ramsay Muir, President of the National Liberal Federation, had hoped to be present, but has written me a letter in which he expresses his regret that neither he nor any of the other officers of the National Liberal Federation can attend as they will be engaged at the annual conference of the Liberal Party. He adds:

"The National Liberal Federation, speaking on behalf of organised Liberalism in all parts of England and Wales, is gravely concerned at the evils arising out of the present system of the private manufacture of and trading in arms. It welcomes the inquiry which is now proceeding and is glad to be associated with the National Peace Council in support of the Memorandum which has been submitted to the Commission, and which includes our views. Had it not been that I have to preside at the Party Conference I should certainly have accompanied you when you attend before the Royal Commission."

The other organisations are the Baptist Union, the Women's Co-operative Guild; also the

Auxiliary Movement,
Baptist Minister's Pacifist Fellowship,
Congregational Christian Pacifist Crusade,
Friends Peace Committee,
Church of Scotland Ministers' Peace Society,
International Friendship League,

22 May, 1935.]

Mr. WILLIAM ARNOLD-FORSTER.

[Continued.]

In addition, I have ascertained that the policy set out in the memorial we have submitted embodies the general policy advocated by the British Trades Union and Labour Movement.

I do not claim, of course, that all the members of all these organisations would endorse every word that I shall say in speaking to the memorial; but I do claim that the broad policy and point of view which I shall outline has the full support of many millions of people in this country. So I have a formidable responsibility to discharge.

I shall venture to base my statement upon two assumptions. Firstly, I assume that the Commission, in making its report, will wish to determine what are the "grave objections" to which the manufacture of armaments by private enterprise is said in the Covenant to be open, and what are the objections to the traffic in arms in its present, almost wholly unregulated, condition. So I shall try, in the first part of my statement, to indicate what I believe to be the main grounds for objection to the present system, the main justifications for public anxiety. In doing so, I shall of course confine myself as far as possible to illustrations which concern British firms and which have not been cited before the Commission hitherto. I shall also be at pains to avoid raising merely personal issues, since I presume that what is under examination here is the entire system in which certain kinds of evil are likely to occur, rather than individual scandals.

Secondly, I shall venture to assume, from the terms of reference, that what the Commission will be most concerned with is the formulation of concrete proposals for preventing such "evil effects" as have been shown, or will be found, to exist. So I shall address myself, so far as I can as a layman, principally to questions of constructive policy. My evidence will be directed to the question, what measures might fairly be commended to the country as being at least sufficiently substantial first steps in the right direction? What measures might the Government hope to make practicable, granted courageous leadership?

PART I.

EVILS OF PRIVATE MANUFACTURE AND OF THE UNREGULATED ARMS TRAFFIC.

Firstly, then, I turn to the evils of the present system of manufacture of armaments for private profit, and of the almost wholly unregulated traffic in armaments.

My main thesis, in a nutshell, is simply this:—That the system of manufacture and sale of armaments for private profit, backed as it is by powerful financial interests, served by a widespread selling organisation, often assisted by the governments of the selling countries, and conducted largely in secret, *must* tend to affect public policy in ways prejudicial to peace, international confidence, and general disarmament.

I submit that, even if no specific evidence were available to prove this—and, as I shall show, much evidence is available—it would still be reasonable to deduce that conclusion from the bare facts about the arms industry in its present circumstances.

I will select three outstanding items from the many-sided case against the present system, and will, if you permit, illustrate each of them with a few examples. I must point out, however, that in choosing these examples, I am necessarily under some handicaps at the moment. The competitive arms trade is conducted in conditions which offer every inducement and opportunity for secrecy, and usually it is only some accident, such as a disclosure by a disgruntled Mr. Mulliner or Mr. Shearer, which flashes an occasional light into the darkness. So I cannot hope to give more than a scrappy indication of the complete picture.

Furthermore, I am speaking at the beginning of the Commission's sessions, at a time when there has never been in this country an inquiry into this trade such as the United States have undertaken. No steps have yet been taken here to compel the disclosure of relevant documents by British firms. All the organisations on whose behalf I speak join in urging that the Commission will insist on taking testimony on oath, whenever this may be called for, and will require the production of documents that may be necessary to throw light on the "evil effects" alleged in the Covenant. I hope that if and when adequate publicity is given to the operations of British firms in this trade, it will be found that the British arms trade, whose export business is the largest in the world, has a cleaner sheet than that of its competitors and collaborators in other countries. But I do not know: none of us knows. At present therefore it is inevitable that most of the illustrations available concern non-British firms.

1. The first and most important of my three points is this.

The firms which make and sell armaments for private profit must desire conditions in which there is an effective demand for their products; and this motive force, operating under present conditions, must have the effect of promoting an expansion of sales of armaments and of impeding agreement upon that all-round reduction of armaments which the world urgently needs.

Do the firms in this country whose business is largely concerned with armament production desire conditions in which there is a demand for their products? Of course they do, just like the producers of beer and soap. They do not find it prudent to advertise the fact on the hoardings: they do not invite us with picture posters to "say it with tanks"; "it's nicer with mustard gas." But of course they desire the business. Of course they desire conditions in which there is a demand for what they have to sell.

I daresay that spokesmen of some of the firms in question will presently assure the Commission that they do not desire war. Let us accept their assurance at once, without reserve (though we should be realistic enough to take note of the colossal profits made by certain firms manufacturing armaments, especially during the war period, cf., for instance, Dr. Addison's evidence as to the inflated prices charged by British armament firms before their quotations were challenged by the Ministry of Munitions; also Exhibits 528, 529 and 530 in the American Inquiry). But that is not the real point at issue.

I daresay that all the directors and managers of these firms, when reading their morning newspapers at breakfast, want to see the nations settling down nicely together, demilitarising their frontiers on the Canadian-American model, beating their swords into ploughshares, or learning, like Krupp, to use their gun factories for making stainless steel false teeth. But can it be doubted that these same individuals, when they go to the office after breakfast in their capacity as managers of great businesses, have to switch over their attention to the job of expanding that business so as to produce dividends for their shareholders and employment for their staff and plant.

Lord Cecil quoted to you the reference by Sir Herbert Lawrence, chairman of Vickers, to those reductions of armaments which, when he spoke in 1932, "have affected adversely your Company's trading results." Can it be doubted that, whilst in his capacity as an ordinary citizen Sir Herbert may desire the success of the British Government's efforts to achieve a reduction of armaments all round, in his capacity as chairman of a firm so largely engaged in making armaments he must deplore such reductions?

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

Naturally, the managing director of Vickers, Sir Charles Craven, was anxious, according to a letter disclosed in the American Inquiry (Exhibit No. 22) lest "Geneva or some other fancy convention" should decide that large submarines have to be abolished; his firm was making such submarines, whilst the British Government was advocating their general abolition. Sir Charles is shown, according to the same letter, as writing in October, 1932:—"The political situation in Spain seems very confused, but there seems a considerable prospect of our friends receiving orders for small craft on the pretext that they are purely defensive." He was referring to the Spanish Naval Construction Company, of which he is, I understand, deputy-chairman. The Spanish company is closely linked with Vickers and pays royalties to it and to the Electric Boat Co. in America (Exhibit 134 in U.S. Inquiry). Naturally Sir Charles would like to see the Spanish company building these ships.

Sir Robert Hadfield, speaking at the annual meeting of Hadfields, Ltd., in 1934, described the firm's production of a new armour-piercing shell which had been patented in eight countries and which possessed extraordinary properties of penetration: according to the report of his speech in the "New York Times" (1st April, 1934), Sir Robert added with refreshing candour: "We are indeed devoutly thankful for present mercies, but may I add that for what we are about to receive may the Lord make us truly thankful. And this I say in no irreverent spirit." Mr. Fairey, chairman of Fairey Aviation Co., in an interview in the "Daily Mail" on 5th January, 1934, emphasised the necessity, in his view, of a large increase of the Air Force, including an increase of the aircraft in reserve by 400 per cent. A few days earlier he had said at the annual meeting of his company that the Air Force could not well be maintained at its present size and that "if it is decided to complete or enlarge the original programme, the result should reflect on this company's prospects."

The American Inquiry has, I need hardly say, afforded scores of indications not less candid than these. Let me cite two examples not yet mentioned here. Exhibit 714 shows the Federal Laboratories of Pittsburgh circularising their agents, in July, 1934, as to the sales of tear gas and war material. The circular states that the company were contractors to 17 foreign governments for military equipment, such as airplane bombs, smoke screens, chemical containers, etc.; and it says: "With conditions of unrest as they are to-day throughout the world, you have a real opportunity before you if you will only get back of this thing and push the Federal programme." Of course the company must welcome such unrest. In Exhibit 732, the agent of this same firm, the candid Mr. Jonas, writes: "I am busy as hell on the Brazilian revolution, and Paraguay and Bolivian situation, and I am bidding on a great many things. If I am successful in closing half of all the business I am working on, I will be able to pay off my debts and have a few dollars left over. This is all I want." Or, again (from Exhibit 740), "Have supplied all the bombs and a lot of other military equipment to most of the countries fighting in South America, and if they keep it up much longer I will have no cause to complain." This is that Mr. Jonas who gave the classic definition of the business in which he was engaged: "We certainly are in one hell of a business, when a fellow has to wish for trouble so as to make a living."

But I must not pile up quotations. Is it not fair to infer, even if no such avowals as these happened to be available, that the industry and its agents must desire an expansion of their business?

We must not reassure ourselves with a comfortable pretence that these business firms simply *desire* business to come their way, but wait passively for its coming. They are not merely scrambling for shares in a cake of predetermined size, but are working to enlarge the cake. Their agents are always at work, in many countries, soliciting business on a commission basis: and as I shall show later, the "commission" system in this trade apparently extends far beyond the normal limits of commercial practice.

Let me cite a few outstanding examples of the active steps taken by armament firms to expand the demand for their products.

I make no apology for beginning with one pre-war case which Lord Cecil mentioned, but did not otherwise recall. I refer to the Mulliner case, because it was a significant outcome of that system which still continues, and because we can now, as we look back into history, trace to some extent the actual consequences of that armament expansion which Mr. Mulliner helped to bring about. This is, I believe, a fair summary of the main facts.

In 1906 and the following years this Mr. Mulliner, who was managing director of the Coventry Ordnance Co., informed the Admiralty and the Cabinet of alleged preparations for enormously accelerating Germany's Dreadnought building programme. Mr. Mulliner published the facts in the *Times* on 3rd January, 1910, being aggrieved that a sufficient proportion of the consequent expansion of the British naval programme had not been allotted to his firm. Four more British battleships were ordered in 1908 as a result of the scare for which he had been primarily responsible. Do not suppose that that incident is irrelevant to our present problem. For note the sequel. Mr. Churchill proposed a naval holiday to Germany; and he afterwards declared (*"Times"*, 15th November, 1933) that "I laboured for peace before the war, and if the naval holiday I advised had been accepted by Germany, the course of history might have been different." The Germans, however, rejected that proposed naval holiday, upon the advice of Admiral von Tirpitz, who urged that the proposal was only another dishonest British manoeuvre like "the Mulliner scare." Tirpitz thus succeeded in getting through his supplementary naval bill of 1912, although the Chancellor, Bethmann-Hollweg, feared that this bill "would lead to war with England." The attempt to reach an Anglo-German understanding was thus wrecked: as Lord Haldane wrote, in his book "Before the War" (1920), "Discussion about the terms of a formula became rather futile and we had only one course left open to us: to respond by quietly increasing our navy and concentrating its strength in northern seas. This was done with great energy by Mr. Churchill, the result being that, as the result of the administration of the Fleet by Mr. McKenna and himself, the estimates were raised by over 20 millions to 51 millions." Was Mr. Mulliner correct in his allegations? Let Mr. Churchill answer the question (I quote from his book, "The World Crisis," page 37): "The gloomy Admiralty anticipations were in no respect fulfilled in the year 1912. The British margin was found to be ample in that year. There were no secret German dreadnoughts, nor had Admiral von Tirpitz made any unproved statement in respect of major construction!"

I do not suggest, of course, that Mr. Mulliner was the main cause of Anglo-German naval rivalry. That would be a fantastic exaggeration. But I do suggest that the sequence of events which followed upon that advice given by an interested party has a lesson for us now. The armament firms got the business they wanted: others paid the price.

Lord Cecil has alluded to the Shearer case in 1927-1928. So I will only add, as a supplement, that the three greatest warship building firms in

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

the United States admitted in court to having paid Mr. Shearer at the rate of over \$5,000 a month for having acted as their observer at the three-power naval conference of 1927; and Mr. Shearer claimed in court a further \$50,000 as the balance due to him for his services in helping to prevent the success of that disarmament conference and in helping to prevent the adhesion of the United States to the World Court. Is that not a sufficient illustration of the truth of what a famous ambassador, Lord Rennell of Rodd, has written about this business? "The propaganda of confidence is uphill work; but the propaganda of apprehension is easy and dangerous." Lord Cecil has already alluded to the control of certain great newspapers in France on behalf of French heavy industry and the armament ring; and he referred to the Seletzki case in Roumania in 1930, in which the Skoda Company was shown as having been involved in bribery on a colossal scale to secure orders for armaments from the Roumanian Government and in which precise testimony was given by M. Goga, a former minister, as to the panic about an imminent invasion by Russian troops into Bessarabia, which appears to have been engineered in order to facilitate the placing of a great order for armaments with Skoda.

Finally, let me refer to a few relevant items brought out in the American Inquiry. Exhibit 124 is a letter, purporting to be from Sir Charles Craven of Vickers to the Electric Boat Co., dated 24th September, 1928. It begins "I am trying to ginger up the Chileans to take three more boats, and want to ask if you will accept the same royalty as you did last time. You will remember this was £10,000 per boat." The Inquiry shows the Electric Boat Co. supplying warships to Peru, and passing on orders for Chilean warships to Vickers. The one order would of course have the effect of stimulating the other, for the two countries, Chile and Peru, were at that time in a state of very strained relations. And the two companies profited alike by such business; the arrangement was that the British firm should pay a commission to the American in respect of the orders thus passed on, in addition to the ordinary commission. All these sales of warships in South America tended of course to promote other sales. Shortly after England, and this stimulated the armament programme of other South American powers. The situation was thus described, justly as I think, by Senator Bone, in the American Inquiry (page 141): "Will they ever be able to get" (power in South America) "in balance, with all of these commissions going down there and with every private munitions outfit in the world trying to unbalance it just as rapidly as possible? How in the world are we ever going to have any sort of international comity and peace with not only private munitions concerns, but the governments of the world, the naval powers that ought to have more sense than to do a thing like that, going down there urging these countries in South America to each outrun the other in this race to be in a commanding position."

Other items which, I suggest, may deserve the attention of the Commission are the indications concerning sales by Imperial Chemical Industries of war material not only to the Nanking Government in China, but also to the Chinese authorities "in certain provinces which are not in sympathy with the Nanking Government" (pages 1346-7,

(Adjourned for a short time.)

On resuming.

Mr. Arnold-Forster: I have referred to the "commission" system current in the armament trade and to some of the anxieties lest armament firms should exert improper influence, directly or indirectly, upon the governments whose orders they so largely depend upon. May I point out, further,

1148, 1350, 1158). I refer also to the letter from Captain John Ball of the Soley Armament Company to the American Armament Corporation, 24th March, 1934 (pages 680-1, 631-2) in regard to the pushing of business with China.

But I must not weary the Commission with further illustrations. I submit that it is quite plain, even from the few illustrations I have given, that those who are making and selling armaments for private profit not only desire to expand, but do in fact find means of expanding, the demand for their products.

2. I come now to the second of my three points about the present system of arms trading for private profit. Conducted as it is largely in secret, in the world of power politics, the trade must tend to the infection of public life with corruption and with undue influence, or at the least towards a dangerous confusion of interested with disinterested motives.

The proceedings of the American Inquiry are filled with evidence and precise allegations about the abuses of the commission system which is customary in the salesmanship of the armaments trade abroad. It is evident from these documents that the "commissions" go far beyond such commissions as are customary in commercial agency work: they include, it seems, payments on a large scale to intermediaries inside and outside the service of the governments which are being induced to purchase armaments. British firms are alleged to be involved in this business abroad. It would, I suggest, be desirable that the Commission should enquire as to the extent to which the system of "greasing" officials—corruption direct and indirect—forms part of the business methods of British firms engaged in this trade at home and abroad.

Indications of the extent of the commission system in the armaments trade in general will be found, for instance, in Exhibits 39, 286, 287, 309, 313, 322, 323, 333. As regards British firms, I refer to the correspondence between Captain John Ball of the Soley Armament Co., who is a large seller of war stores taken over from the War Office (Exhibit 258, etc.). I draw attention to the allegations in Exhibits 286, 287, as to graft on a large scale in connection with the sale of aircraft by the Fairey Aviation Co. to Peru; and also to the letters, now well known, in which Sir Charles Craven, of Vickers, refers to his relations with the Director of Contracts at the Admiralty, and with the Director of Dockyards, Mr. Percy Addison. It is not for me to assert that these documents show improper influence or even an undesirable relationship between the firms supplying armaments to the Government for profit and the official servants of that Government. But I do submit that there is here a clear case for searching and public inquiry.

But in expressing the hope that the Commission will make such an inquiry, I wish to emphasise again that, in the view of those for whom I speak, the main issue is not whether British competitors resort to discreditable methods in a business in which such methods are common; the main issue is not even the question whether the present system has actually resulted in this or that case of bribery, or undue influence upon public servants; the main question is whether the armament trade can be suffered, without prejudice to the public interest, to exploit its opportunities for profiting from the world's fears.

how difficult it is under the present system to disentangle the interested from the disinterested motives. At present, a newspaper company, a newspaper proprietor, or a writer for the press, a member of Parliament and even a member of the Government, can buy himself shares in firms whose profits depend largely upon orders for armaments

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

from the British and other governments. In pointing out this feature of the present system, I emphasise that I do so without the intention of casting any aspersions upon any individual who may be in a position to influence public policy whilst deriving profit from the sale of armaments. But I do maintain that, so long as such holdings can be owned by ministers of the Crown and members of Parliament, the advocacy in Parliament of an active policy of general reduction of armaments must be to some extent in danger of being tempered by consideration of the private interests involved. I submit also that it cannot be healthy for the repute of a government if it is known that Cabinet Ministers may be in a position to benefit personally, however slightly, from the breakdown of disarmament negotiations and from the placing of orders with armament firms by their colleagues who speak for the fighting services. It cannot, for instance, be good for Anglo-American relations that Mr. Selden, correspondent of the "New York Times," should be able, apparently without inaccuracy, to report to his paper in March of last year ("New York Times," 1st April, 1934), that "Sir Philip Cunliffe-Lister, Minister of Colonies, and Sir John Gilmour, Minister of Home Affairs, were referred to at the meeting" (he was referring to Vickers annual meeting) "as Vickers' shareholders. Neither was present however. Like the other members of the Government, both these Ministers have been busy this week in Cabinet sessions, attempting to solve the disarmament deadlock before the Easter vacation." I should add that, according to the returns in Somerset House, the Home Secretary is still shown, so lately as 16th April, 1935, as holding 3,066 ordinary shares in Vickers. I hasten to add that the holding by the Secretary of State for the Colonies is of merely nominal size—twenty-five shares only. It may easily happen, no doubt, that busy ministers may have overlooked their holdings of this character; it may even be that the holdings are only nominally registered in their names: in any case, I do not believe for a moment that the policy of Ministers has been affected in any degree by the fact of their holding such shares. But I do venture to suggest that there are objections to a system in which two interests, the one public and the other private, may be so closely intertwined.

Let me give one other example. Between October, 1933 and the early months of 1934, the "Daily Mail," followed by the "Daily Mirror," was conducting a campaign in favour of a large increase of the British Air Force. Between 2nd October, 1933, and 31st March, 1934, the market prices of the shares of the six principal companies making aircraft had appreciated on an average by 70 per cent. (I should add that of course some other shares appreciated at the same time). As I have already mentioned, Mr. Fairey, chairman of Fairey Aviation Co., supported this campaign in an interview in the "Daily Mail" on 5th January, 1934. The returns at Somerset House, dated 12th January, 1934, show that at that time "Daily Mirror Newspapers, Ltd." held 4,000 shares in Fairey Aviation Co. Ltd., I do not believe for a moment that the proprietors, or writers for, the "Daily Mirror" or any of its associated newspapers, would support a policy of expansion of the British Air Force which they would not have supported if it had not been for the holding of a few thousand shares in an aircraft-making company. I take it for granted that the newspaper, in advocating a policy of armament expansion, was thinking solely of the national security as conceived by it; and I fully recognise of course that the financial interest involved in this instance was a trifling one in relation to the financial resources of the concern. But I do submit that there must be some risk that if newspaper concerns can hold shares in armament concerns, the one interest may to some extent infect the presentation of the other issue.

3. That brings me to my third and last point. The present system lends itself to the formation of rings, national and international, between the armament firms; and this must involve the danger that these firms will play into each other's hands in stimulating the demand for orders and in forcing up prices against the taxpayer.

I believe that no part of this Commission's inquiry will be of more concern to the general public than its investigation of this subject, especially as regards what has been called "the Secret International." The American Inquiry has served to disclose many relevant facts hitherto kept secret; and already it is possible to form a fairly adequate idea of the astounding extent of the ramifications of this business, and the way in which armament makers in one country assist and profit from the work of armament makers in another country. I shall not attempt to draw this picture here; for I understand that a later witness will be dealing with this intricate subject far more adequately than I can possibly do. But I say with confidence that the Commission and the country will be impressed and disturbed when these facts are properly set out: impressed by the enormous power of the vested interests involved, and disturbed by the manifest dangers of the situation in which society is so much at the mercy of an organisation so largely interested in the sale of armaments for profit. The public is not mistaken in being specially anxious about this aspect of the subject. For the kind of association I speak of affects the public interest much more closely and dangerously than any ordinary commercial agreement for the repartitioning of markets, or for the exchange of material and technical resources. The armament industry is unique in this vital respect; a trader in one country stands to profit, in this business, rather than to lose, from an increase in the business of his opposite number in another country, if that country's relations with his own country are not unassailably based upon mutual confidence. Great armament firms, such as Schneider Creusot, Skoda and Vickers Armstrong, are in many respects colleagues in the supply of killing power to the world rather than rivals; and great manufacturers of chemicals, explosives and poison gas, such as I.C.I. here, Du Pont's in America and the I.G. in Germany, are in much the same position.

As regards those agreements which cut across national frontiers, I submit that inquiry is desirable as to the nature and consequences of the agreements between Vickers and the Electric Boat Company, and between I.C.I. and Du Pont, concerning which texts and particulars were published in the American Inquiry. Two points in particular about these agreements appear to merit inquiry, in relation to this Commission's terms of reference.

(a) Messrs. Vickers have, it is now disclosed, been paying large sums derived from the British taxpayer to the Electric Boat Company in the United States for use of the American Company's patents, etc. The sums paid averaged £28,000 per boat, according to a letter from the President of the Electric Boat Company, dated 20th April 1925 (Exhibit 10); and the royalties received by the American company from Vickers and their associated companies in other countries is given in some detail in Exhibit 9, showing that hundreds of thousands of pounds derived from the British taxpayer were paid to the American company on this account.

My question is whether the agreement under which these payments were made was fully disclosed at the time to the British Admiralty, which was Vickers' principal client. If not, what is the explanation of the letter from Sir Charles Craven, dated 30th July, 1932 (Exhibit 21), about the royalties due to the American company? The

22 May, 1935.]

Mr. WILLIAM ARNOLD-FORSTER.

[Continued.]

American company, according to this letter, telegraphed in code to Sir Charles Craven saying that it would accept a reduced royalty in respect of certain warships named. Sir Charles replied, quoting his decode of the telegram and adding "First, may I suggest that even in code it is better not to mention any names of ships as I am rather afraid that such telegrams might get into the hands of our clients, and it would be awkward if they ask me about our agreement with you. I am sure you will appreciate what I mean." It appears from a further letter (Exhibit 23) that the warships in question were for the British Admiralty. Does the correspondence mean that Sir Charles Craven's firm, whilst tendering for Admiralty contracts, was afraid that the Admiralty might find out about its agreements with the American company?

(b) My second question concerns the possible leakage of information which the Admiralty would wish to keep secret. In Exhibit 23, Sir Charles Craven is shown as writing to the American firm about an Admiralty order for a warship which the Admiralty would have a right to withdraw "if Geneva or any other troublesome organisation upsets the large submarine. In view of this, I am not saying anything publicly about the *Clyde*, and I would suggest that it would be wise that Spear" (of the Electric Boat Company) "should not let the information get into the hands of your Navy Department until after I can tell you that we really have a proper contract." Does this mean that Sir Charles was passing on to his American colleagues advance information which the Admiralty would not like the Navy Department of the United States to receive at that time?

Here is another illustration of the same point. In Exhibit 126, Sir Charles Craven is shown as writing, on 31st March, 1928, about a contract for a foreign power (apparently Chile): "The whole thing has been most secret, and as Dawson" (Sir Trevor Dawson of Vickers) "negotiated the final contracts with the Chief of the Commission in London, I had to accept his ruling, that I was not even to mention the matter to you in writing, hence the message by Roberts" (i.e., Vickers' agent in the United States and a member of the board of directors of the Electric Boat Company). "Even to-day" (Sir Charles' letter continues) "we are bound to secrecy, so will you please promise me not to let your little friends from the other South American country know what is going on at present." Sir Charles was presumably alluding to Peru, for which country the Electric Boat Company had been building ships. I suggest that if pledges of secrecy have in fact been disregarded so lightly as these letters seem to imply, the present system of international agreements between firms making armaments for private profit must occasion some anxiety for the admiralties.

Yet another question that is suggested by the published correspondence is this. Is it the case that the armament firms in one country and another make secret agreements for collusive tendering, so as to force up the price against purchasing governments? It appears from a number of letters and statements in the American Inquiry that Vickers were party to collusive arrangements of this kind. We find, according to a letter from the Electric Boat Company, dated 28th December, 1921, that the American Company "authorised Vickers to submit a tender for the work to be done in England" (work on submarines for Brazil) "at prices which they submitted to us and which we approved." The spokesman of the Electric Boat Company stated in the Inquiry that Vickers was given by them the alternative of raising their bid to the Brazilian Government, or else of making a low bid and paying a high percentage to the American company. In the candid

words of Mr. Carse of the Electric Boat Company in the same letter, "Too many bids for the same thing might prove very inconvenient."

Here is another example of the same kind of price raising. In Exhibit 115 Mr. Spear of the Electric Boat Co. writes to his company, on September 20th, 1923, about an order for warships for the Argentine which he had been discussing with Sir Trevor Dawson of Vickers. He says in this letter that he has advised Commander Aubry about this business; Aubry was the agent of the Electric Boat Co. in Peru, and in 1929 became agent for Vickers as well. "I have advised him" (i.e., Aubry) "in a general way that it may be our policy to support the bid of our English friends in the Argentine and that we may also decide to have a friendly controlled bid put in from Italy. . . . The general idea, of course, is to fix the Italian price a little higher than Vickers' price, and if by any chance they should get the order, the profit will be ample to take care of them as well as Vickers and ourselves."

I should weary the Commission if I tried to cite all the other indications in the American Inquiry about these price raising rings; but here are three more brief passages. In Exhibit 125 Sir Charles Craven is shown as writing, on November 7th, 1927, to the Electric Boat Co.: "During the last few days by skilful manoeuvring we have managed to get some of our competitors' prices in the Chilean competition put up, and so may have prevented a real price cutting war which would have resulted in our taking the boats at a loss." On November 28th, 1930, Sir Charles Craven wrote, according to Exhibit 162, as follows, to the Electric Boat Co.: "For your very confidential information, we have come to an arrangement with Hawthorn Leslie's and Thornycroft's in connection with the Portuguese naval programme. The broad outline of the scheme is that we shall take half and the other two firms each a quarter of whatever orders we can get."

I will only add that other Exhibits, such as 486, 487 and 488 show, apparently, a similar price raising arrangement between Imperial Chemical Industries and Du Pont's.

I have been speaking of business which involves the international armament ring. I must add something about the question whether armament rings exist within this country.

Firstly, I refer to a case which concerns past events but which cannot by any means be regarded as dead. I submit that inquiry is called for into the question raised by Exhibits 18, 19 and 20 in the American Inquiry. In the absence of explanations, these letters from Sir Charles Craven to the Electric Boat Co. in 1927 must occasion public anxiety; for they seem to imply that, before Messrs. Vickers made their fusion with Armstrong Whitworth's, Vickers were collusively arranging with Armstrong's the terms of the tenders which would be put in to the Admiralty. When Sir Charles Craven states, in a letter marked "strictly private," dated November 30th, 1927, that "for your private information, I was in a position to look after Armstrong's and keep them out of the picture on this occasion," was he not in effect describing a secret agreement to bleed the taxpayer? When he wrote in the same letter "I am trying to arrange things so that with the Admiralty we count as two shipyards and can therefore put forward two tenders, but this of course will be rather difficult," what was his motive if not that Vickers and Armstrong's should put up an appearance of competitive tendering, when in fact their tenders would be subject to previous agreement in the interests of the combine?

I hope that the inference which these letters appear to suggest can and will be rebutted. But I hope also that fearless and searching inquiry will be made.

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

I have been able in this instance to hang my case upon a particular example since the American Inquiry has been the means of disclosing some of the documents which the parties to the business would otherwise conceal. The rest of my case is not less important, but cannot be based, at least so far as my evidence is concerned, upon documents already published. I submit the question—does any agreement as regards tenders for government orders exist amongst the firms which compete, or ostensibly compete, for government orders for armour plate? This question is, I suggest, relevant to the Commission's terms of reference; for if there is such an agreement—and past history suggests that it is not impossible—then manifestly the public may suffer from the exactions of a virtual monopoly working for profits in the supply of a commodity which is still regarded as very important for national defence.

Lastly, I raise the same question in a still more important connection. Is there a secret agreement between some or all of the British firms which make military aircraft for the government of this and other countries? I put this question not because I have any knowledge that such an agreement exists but because, under the present system there is an obvious danger that it may exist, especially in what is now the largest branch of the armament industry wholly or almost wholly outside the restraining influence of competition by government factories. Let us assume for the moment that the nations must go on making military aircraft with which to menace each other in the name of "security" (though personally, I must say, I hope that assumption will be generally recognised before too late as the fallacy that it is). Assuming that we must have national air forces, is it not financially imprudent—to put the case at its very lowest—to rely entirely on private manufacture without even that check upon prices and quality which a few state-owned factories might afford? Would it not be wise, in any case, to make very sure, by such means as this Commission has at its disposal, that an industry subject to such exceptional temptations to arrange for collusive tendering at the national expense does not succumb to those temptations?

I have spoken of the danger that armament rings, impelled by the motive of private profit, may combine to force up prices against their customers. But that, of course, is not the main point I want to bring out. The essential point is that the firms engaged in this business must, under the present system, be in a position to play into each other's hands in promoting the expansion of armament orders and in opposing disarmament. The letter, apparently from the Electric Boat Co., to Sir Charles Craven, dated 6th August, 1928, which appears as Exhibit 127 in the American Inquiry, expresses a concern which must be shared by British firms as well as American and other firms, engaged in this business: "it is too bad that the pernicious activities of our State Department have put the brake on armament orders from Peru by forcing the resumption of formal diplomatic relations with Chile."

I have put to you three main points about the evils alleged in the Covenant. I have maintained and tried to show that the present system of armament production for private profit and the almost wholly unregulated traffic in arms must and does have certain evil consequences.

One, the arms traders must desire conditions in which there is a demand for their products, and must, with their great resources, be in a position to stimulate that demand.

Two, the system must and does tend at least to a dangerous confusion of interested with disinterested motives and may at the worst lead to corruption inside and outside the public services and the exercise of undue influence by interested parties.

Three, the system lends itself to the formation of armament rings in a position to play into each other's hands in stimulating demand and in exploiting the taxpayer by collusive tendering for government contracts.

I venture to claim that those three points alone are sufficient, and are sufficiently established, to justify the conclusion that the present system is open to very grave objections and must in some way be radically changed. What form should that change take?

PART II.

REMEDIES.

I come now to the major question: assuming the existence of such evils in the present system as I have indicated, what remedies might usefully be proposed? In the memorandum which has been submitted to you by the 26 organisations on whose behalf I speak, the first point emphasised is that the unregulated arms trade is only one of the factors which make for international anarchy, and that by far the most important task is to amend the situation in which there is a demand for armaments, whether manufactured by private enterprise or by the state. This particular problem about the arms trade is, of course, only an item, though an important item, in the much larger problem of securing a genuine renunciation of war, a limitation, reduction and eventual abolition of national armaments, and the development of a collective peace system based upon a universalised League of Nations.

(A) *The Licensing System.*—The first point I want to make concerns the British licensing system. The League of Nations Union has already submitted to you the view that no mere licensing system, however comprehensive, will suffice to prevent some of the principal evils of the present system of arms traffic, unless limits are fixed for national armaments by international agreement. That view is fully endorsed by the organisations on whose behalf I have the honour to speak. It is an argument which applies, of course, not only to the export trade in armaments manufactured by private enterprise, but also, at least to a considerable extent, to armaments that might be exported by state factories. The government of a country which exports armaments may desire, and as matters stand, will desire, that the factories within its territory, whether state-owned or privately owned, shall get a lion's share of whatever business in armaments may be available. The American Inquiry has shown many examples of the direct intervention of government officials in order to promote sales by armament firms in foreign countries. I need only refer, as an illustration, to the case in which the American cruiser *Raleigh* was used to demonstrate the war material offered for sale by the Driggs Company to Turkey. Other illustrations concern the alleged use of the British Diplomatic Service for promoting the trade of British armament firms in South America, Finland and elsewhere; and I hope the Commission will find occasion to inquire into the question whether H.M. Legations and Embassies abroad, e.g. in Scandinavia, have been used to induce foreign governments to buy armaments from British firms. My point is that, if a government, for whatever reason, desires an expansion of the armament trade of its nationals in foreign countries, the licensing system will not avail by itself to prevent such evils as now result from the system of touting for orders, so long as the market remains capable of expansion to an indefinite extent. It is most desirable that the licensing system and any other method of regulating the arms traffic should be fitted into the framework of a general agreement to limit the quantity, quality and cost of armaments. I do not wish to suggest that an extension of the licensing system, such as the American Government has proposed, would

22 May, 1935.]

Mr. WILLIAM ARNOLD-FORSTER.

[Continued.]

be worthless without a general disarmament treaty; but I do maintain that its value would be enormously diminished.

The Commission will presumably have occasion to consider whether the British licensing system as it now stands calls for improvement. I suggest that, in this connection, inquiry is desirable on these three points.

(a) Firstly, is it the case that, under present conditions, almost all the licences actually applied for are granted, virtually as a matter of course? I note that on 24th April, 1934, the President of the Board of Trade stated, in answer to a question in Parliament, that during the past four years, 1930-1933, only seven formal applications for licences to export arms were refused. He added, however, that "in cases of doubt prospective applicants normally make informal enquiries." In the 12 months ending 31st October, 1934, 415 licences were granted and seven refused. I raise the question not, of course, with the idea of suggesting that the British licensing system, such as it is, is valueless, but only to show that it may not have so substantial an effect in regulating the British trade as has sometimes been claimed.

(b) Secondly, I submit the question whether British firms have attempted or planned evasion of the licensing system, and what steps are taken to ensure that armaments are not falsely described by their exporters as commodities of some other kind. "Tractors" for instance to represent an export of tanks. I raise this question because the American Inquiry has shown that, in the United States, such control as existed is utterly inadequate to secure even an approximate enforcement of a licensing system.

I refer to the evidence of customs officials at New York. As to our own country, where the legal position is, of course, better, the Inquiry has also thrown light upon the dealings or intended dealings of Soley & Co., a British firm, stated to hold enormous stocks of war material obtained from the War Office. Captain John Ball, director of this Company, refers in his letters (Exhibits 256, etc.) to the need for submitting "to a fairly strict control by the authorities concerned"; and in his letter of 3rd February, 1934 (Exhibit 257), in which he agreed to appoint the American Armament Corporation as the firm's sales representative in Latin America, it was specified that "all the regulations governing the sales of arms from Great Britain into U.S.A." should be observed. Nevertheless, we find Captain Ball writing on 24th March, 1934 (Exhibit 260), as follows:—"We have, of course, heard from several sources that Bolivia wants A.A." (anti-aircraft) "guns quickly, but we do not think for a moment that a shipment or sale to Bolivia could be made direct while that country is at war. If, however, an American armament firm of some standing bought the guns, for eventual re-sale, things might be easier, or if the Colombian Government, who are not at war, bought the guns, they could no doubt have them." The letter raises the question whether this company, closely associated as it is with the British War Office, and controlling stocks which, according to its own claim, "are of such magnitude that the sale of a big block of them could alter the political balance of power of the smaller states", has been seeking to evade the embargo that was imposed by the British Government upon exports to Bolivia and Paraguay. In passing, I suggest that the holding or controlling of stocks of this magnitude by any private firm, however reliable, may constitute another dangerous feature of the present system. This firm, for instance, lists, amongst the stocks controlled by it, armaments valued at approximately £6 millions, including a million rifles and a hundred and twenty million rounds of ammunition for rifles and machine guns, and many tens of thousands of machine guns of various types.

(c) Thirdly, I submit the question whether there are in fact such gaps in the British licensing system as might have the effect of stultifying an embargo or rendering illusory the apparent effectiveness of the licensing system.

The President of the Board of Trade stated in Parliament on 7th June, 1932, that, where English firms have factories abroad for producing munitions of war, the licences do not apply: they apply "only to exports from this country." Does that mean that Messrs. Vickers, for example, are free, or have a blanket licence, to export raw material, partly finished material, or finished parts or completed weapons, to their associated firms in Japan and elsewhere?

On 9th March, 1933, Mr. Baldwin was asked whether the embargo on exports of arms to the Far East would affect the Air Ministry licences granted in 1932 for the manufacture of British aircraft in Japan. He replied that the embargo then in force "does not affect the manufacture of aircraft in Japan." Does this mean that British firms manufacturing aircraft and having associated houses in Japan could virtually ignore that embargo upon exports to Japan and China which caused so much stir at the end of February, 1933, when Japan had been condemned as a violator of the Covenant.

It has been stated in Parliament on a number of occasions, e.g., on 28th June, 1934, that specific licences are not required for any aircraft exported to any destination other than Abyssinia, unless these aircraft are fitted with armament; in that case, licences are required for the armaments only. Does that mean that aircraft of military design can be and have been exported to Germany, for example, unlicensed because unarmed? Does the system allow for the unlicensed export of aircraft engines of a type suitable for military machines?

I suggest that whatever decision may be reached as to the imposition of a really comprehensive licensing system for exports, imports, and manufacture on the lines proposed in the American draft convention on this subject, some review of the present British licensing system may be found desirable, and that the questions I have ventured to put are amongst those which would be pertinent. I put them, of course, as questions to which, frankly, I do not myself know the answer. The system may in fact be perfectly watertight; but the Commission will, I think, agree that, in view of the answers in Parliament which I have cited, the layman cannot yet feel assured that the licensing system is adequate even for its own very limited purpose.

(B) *The American Arms Trade Plan.*—I pass now to a more important subject—the American draft convention which has been under discussion at Geneva. The League of Nations Union has expressed to you its unanimous opinion that this convention, as submitted to the Disarmament Conference last November, in document Conf. D. 167, should be accepted in its general lines: The Union has declared that it "would regret any amendment to the draft convention which would lessen its effectiveness, and hopes that the Royal Commission will recommend the signature and ratification of such a treaty under the second of their terms of reference." Major Hills this morning spoke in the same sense. And I now submit just the same recommendation on behalf of all the organisations for which I speak. As you will see from the memorial submitted, these organisations share the view that the American plan would be a substantial step in the right direction; and many of them have been active in urging the withdrawal of the British Government's proposal for the abandonment of some of the main features of that plan.

Forgive me if, at the risk of a little repetition, I recall the sequence of events and the main points

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

at issue. I venture to do so because the subject was by no means exhausted at the Commission's first session, because essential documents have not long been available, and because there are grounds for thinking that the nature and purpose of the American plan are still somewhat widely misunderstood.

On 30th May last year the American delegate at the Disarmament Conference made, you remember, a notable declaration on this subject, calling for the control or elimination of

"the production of and traffic in engines of death and the profits resulting therefrom . . . Those in all countries who had a financial interest in fomenting international suspicion and discord, which in turn increased the demand for what they had to sell, must be put into a position in which they had neither the power nor the incentive to do so much evil . . . The U.S. Government was ready to join in measures for suppressing that evil and were prepared to negotiate, in connection with disarmament, a Treaty that would deal drastically with the problem."

I recall that declaration made in the name of "the American people and Government" in order to emphasise at the outset the extraordinary importance attached to this subject in the United States. We ought not to forget that.

On 8th June last year the Disarmament Conference decided that there were at least three parts of the disarmament convention on which work might usefully be resumed at once; and one of these parts concerned the arms trade. Accordingly, on 30th June, the American delegation submitted their first plan to the Arms Trade Committee. The intention of this plan was that it should form part of the disarmament convention; so it included references to the limitations of armaments that were to be provided presently by the Geneva convention, and it assumed that the permanent disarmament commission would be provided for elsewhere in the Convention.

But at that stage unfortunately the international situation worsened; and on 20th November the Bureau of the Conference decided that it would be better to proceed with the arms trade plan in the form of a limited convention which might be at once a useful contribution in itself and also a means of facilitating the conclusion of a disarmament convention. The Americans therefore revised their plan, so as to make it a convention which could stand on its own feet as "a treaty of limited objectives." For this reason, the second American plan omitted all reference to limitations of armaments, but it included, as the earlier plan had not, those provisions for a permanent disarmament commission which had already been worked out.

It will be appreciated from this review how specially important it was not to fail in welcoming and making use of this valuable American contribution, especially at a time when the long disarmament effort had reached so disheartening a stage. I must express my conviction that an extraordinary effort should have been made to secure the early acceptance of that American plan without substantial change, so that it might serve, as the Americans intended, both as a self-contained treaty of limited objectives and as an item which could be included in the general disarmament convention without substantial reconstruction.

Unhappily, however, that is not what has happened. In February of this year the Arms Trade Committee met to discuss the plan, and, contrary to expectations, the British Government took the lead in opposing some of its vital provisions. The document has emerged from its first reading with a few clauses agreed upon

unanimously, though sometimes in a much weakened form. The other clauses are presented simply as a series of conflicting texts in parallel columns, the British Government being the leader of a small minority, generally including only Italy and Japan and sometimes Poland. The door is not yet shut. It may still be possible at the second reading to secure an agreed convention: but I must frankly say that so far as I have been able to learn there is little chance of this unless the British Government modifies its policy and accepts a less eviscerated convention.

The purpose of the American plan, you remember, was this.

1. *State Responsibility*.—The contracting states were to assume entire responsibility for the control of arms trade and manufacture in their territories. This has been much weakened in the corresponding article of the first reading text.

2. *Licences*.—All manufacturers, and all exports and imports of armaments of the kind listed in certain categories, would be licensed by the state. A substantial measure of agreement has been reached about this, though it is still by no means complete.

3. *Publicity*.—All armaments of the kinds listed, whether made in state or private factories, were to be subject to a system of publicity, from the stage of ordering to the stage of delivery, the particulars being supplied to the permanent disarmament commission at Geneva. This crucial provision for publicity of orders has been rejected by the British Government. The publicity proposed by the British, the Italian and Japanese delegations would apply only to the *total values* of the articles in certain categories.

4. *Supervision*.—The whole system was to be subject, though with certain important exemptions, to periodic inspections on the spot on behalf of the permanent disarmament commission: it was emphasised that such inspection ought to be such as to be effective without being annoying. It was claimed that such inspection was essential as a means of establishing mutual confidence between states in those cases where confidence is lacking or might be in danger. The British amendment eliminates altogether this crucial provision for inspection on the spot: it merely provides for report by the governments themselves to Geneva.

Thus there are three main points on which the British plan differs from the American.

(a) *Inspection on the spot*.—Firstly, there is that point about inspection on the spot. The British Government, in its memorandum of 29th January, 1934, declared at last (many people thought much too late) that it would be willing "if general agreement is reached on all other issues, to agree to the application of a system of permanent and automatic supervision, to come into force with the obligations of the convention." In other words, that guarded acceptance of the principle of inspection on the spot was conditional upon the conclusion of a general agreement for the limitation of armaments. The argument now advanced (e.g., by Mr. Stevenson, the British delegate, on 13th April, and by Lord Stanhope on 14th February) is that, so long as there is no limitation of armaments, there will be nothing substantial to inspect. Lord Stanhope also used the argument that we must rely confidently upon the good faith of the governments which forward information to Geneva. The critics of this argument point out that there would be something very substantial to inspect if, as the majority of delegations desire, there is publicity for orders and amounts as well as for mere values. They hold also—and for my part I think their argument is irresistible—that we shall never get anywhere if we begin by postulating that we

22 May, 1935.]

Mr. WILLIAM ARNOLD-FORSTER.

[Continued.]

must rely absolutely upon mutual confidence. The essence of our problem is precisely that in some cases that mutual confidence is unhappily lacking.

It is sometimes argued that inspection on the spot can only serve to create ill-feeling and cannot really be effective. The experience of the Allied Control Commission in Germany after the War is cited as evidence of this. I cannot think, however, that this illustration is a conclusive proof. It must be remembered that we are dealing here with a situation that would be very different from that which existed under the unilateral disarmament scheme of Versailles. Then, the Germans were not willing partners in the enterprise; they could not feel that the system of inspection was of service to a cause that was Germany's as well as France's and England's; all Germany regarded itself, rightly or wrongly, as the victim, not as the partner, in the system. But under such a convention as we are discussing—a convention in which, it may be hoped, Germany would be a colleague upon terms of full equality—the system would have an utterly different psychological foundation. I do not claim that we could hope for full loyalty by all states overnight. I do not suggest that for a moment, in the face of determined evasion on a great scale, a system of international inspection, even if voluntarily accepted at the outset, would be 100 per cent. effective. Far from it. But I do maintain that a system of inspection on the spot is absolutely indispensable for psychological reasons if for no others, and that such a system, operating normally as a matter of course at fairly frequent intervals, would be far less likely to give rise to recriminations and bitterness than a system of inspection intended to operate only in the event of an actual allegation of some evasion of the agreement.

I have just received a resolution which was passed unanimously yesterday by the Women's National Liberal Federation, supporting the view I have expressed and urging acceptance of international control "including inspection on the spot."

It is not possible, of course, for a layman without inside information to weigh the considerations which determined the British Government's policy in this matter: I do not know what calculations as to the probable reaction of Germany, for example, made the Government decide to reject inspection on the spot at this stage. But I do know that the elimination of this element from the American plan is widely regarded, abroad and at home, especially in France and America, as a very heavy blow to the chances of agreement upon such a convention.

(b) *Publicity for Orders.*—The American plan proposed publicity for all orders from whatever source received.

(c) *Publicity for quantities to be manufactured or purchased.*—The first reading text, as submitted by the majority of the Committee, provides for publicity showing the quantities of armaments of certain categories to be manufactured or purchased in the course of the year by the government; and also a description of the articles ordered. The British Government's proposals, on the contrary, provide only for annual statements by each government of the expenditure which it intends to incur on armaments, coupled with quarterly returns by value only of production, exports and imports. It has even been made plain that the British Government is not willing to transmit to Geneva copies of the licences issued by it. The American plan would show promptly when an abnormal armament demand was springing up in a certain quarter. If, for instance, some South American state was preparing for a conflict with a neighbour state, the orders placed with British and other firms would be reported fairly promptly to the permanent disarmament commission. In

the words of the American delegate "they wanted to follow a cannon from its birth to its maturity." Under the British plan, the state in question might give an honest or partly honest statement of its intended orders, merely in terms of total value, for the forthcoming year: but that statement made in January might, if I understand the plan rightly, be stultified by the orders actually given in February.

The Committee's draft, in calling for a statement of all manufactures effected during the year, calls for something definite and easily calculable. The British alternative, which calls only for a quarterly return of the total value under each heading of the categories of the armaments manufactured, calls for something quite indefinite. How is this value to be assessed? I do not know. It is not indicated in the draft. What is the real use of such information when obtained? This point about publicity for orders and publicity for quantities is really much more important, I believe, than the other point about inspection on the spot.

It is impossible, I repeat, for a layman who was not present at these intricate discussions, held largely in secret, to estimate all the factors which went to the making of these compromises and amendments. But I do feel bound to express the opinion, for what it is worth, that the British reservations knock so large a hole through a most promising project as to make it most unlikely that either France or the United States would subscribe to the poor residue that would survive if those reservations were accepted. There is a chance for a revision of British policy at the second reading. I do trust that the Government, which in its policy about this, is in line only with fascist Italy and militarist Japan, will see its way before too late to make that policy more consonant with that of the United States. For here, I believe, on the lines of the American plan and already acceptable to the great majority of nations at Geneva, a very important contribution could be made towards solution of the problems covered by this Commission's terms of reference.

(C) *A National Armaments Board.*—Reference has been made at your earlier session to the desirability of establishing a national armaments board with the status of a public corporation, charged with the responsibility of controlling the manufacture, sale and distribution of arms. I want to support this proposal. I believe that some such organisation, free so far as possible from the pressure of vested interests, will have to be set up if the nation is to assume that "full responsibility" for supervision and publicity which the British Government has provisionally approved of in Article 1 of the first reading lately completed at Geneva; and I believe that such a board, by serving as the channel through which armament orders from at home and abroad will have to pass, would do a great deal to eliminate such evils as I described in the first part of this statement. But I shall not attempt to supplement what has been said on this subject by Colonel Carnegie. I had hoped that Mr. Ramsay Muir would be able to be here to do so, but as I have said, he is compelled to be elsewhere.

(D) *Nationalisation.*—I have spoken of the need for a review of the British licensing system in any case. I have urged that the American arms trade plan should be accepted without weakening amendments, and that the British Government should endeavour to get the second reading text generally accepted without those damaging amendments to which I alluded. I have expressed the belief that a national armaments board is desirable. Finally, I want to urge, on behalf of all the organisations for which I speak, that all these steps would be insufficient. What is that powerful force which has created all the difficulties

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

I have indicated? Partly, of course, national apprehension, but in large part the motive of profit making. What is needed now is action to take the profit out of war and the preparation for war.

I submit that the state should assume direct responsibility for completing the manufacture of all casualty-producing weapons; and that the object of the measures taken should be (to quote the proposal of the French, Spanish, Polish and Danish Governments in March, 1933) "to reserve to the state that part of industrial production which renders it unfit for pacific purposes and destines it exclusively for military use."

It is sometimes argued that "armaments" cannot be adequately defined. That contention is impossible to sustain, in face of the facts about the British licensing system and in face of the schedule of armaments included in the draft convention of the Arms Trade Committee. Moreover, what matters most in this business is that the state should be in a position of absolute control, not over every single item which goes to the making of the vast machine of war, but over those items without which modern war cannot be conducted. If the state can command the neck of the bottle, it can command broadly speaking what shall come out of the bottle.

It is sometimes argued that the state cannot afford to forego the advantages it derives from the cheap and rapid expansion of armament production by means of a flourishing private armaments trade. It is pointed out that these firms can be kept happy and busy without cost to the home government by allowing them to pour out their killing power—though not perhaps of the very latest model—to all the powers of the world except x, y and z. I recognise the force of that argument; but I remember the impressive finding of the McKinnon Wood Committee in March, 1919 (Cmd. 229), after the most tremendous trial of the national armament production ever known. The Committee wrote, in its second interim report to the Ministry of Munitions: "It is also probable that the country will insist on the production of all armaments being confined to government factories; nor would the disappearance of the larger armament firms materially handicap production in the event of a serious war. . . . The magnitude of present-day war operations is such that the reserve of manufacture in peace-time for war development cannot be looked on as being concentrated in the government arsenal and two or three particular firms. The real reserve for war is the whole of the manufacturing power of the country, which has been educated in the supply of armaments."

It will be argued, no doubt, that nationalisation of the completing stage of armament production would be extremely costly. In reply, I recall the fact that the French Ministry of Finance in 1933 was charged with the task of estimating how much it would cost France to abolish private manufacture of armaments, with compensation for the shareholders of the private firms. The Ministry reported that the prices at which armaments were supplied by the national arsenals were found to be so much below those of the private firms that the savings on the defence budget would cover the whole cost of compensation, and that no addition to taxation would be required. I cannot say, of course, whether a similar inquiry in this country would yield similar results, but I see no reason to suppose that it would not. It would be relevant in this connection to compare the prices of munitions in the early stages of the war with those that afterwards resulted from the work of the Ministry of Munitions. In the *History* of that Ministry, it is stated that "the immense savings in the cost of gun ammunition during the first year of the Ministry's existence were chiefly effected by confronting the larger contractors with the cost returns from these" (the national) "factories."

It is often argued that the non-producing states would be in a worsened position. I do not think this assumption has been proved; and I recall the conclusion submitted by Denmark, which is one of the countries in question, to the Disarmament Conference in February, 1933 (Conf.D./C.C.F. 31) "The non-producing states derive no benefit from the system of private manufacture. The abolition of this system would not therefore modify the situation of non-producing states in any way."

I have indicated some of the objections commonly advanced. There is one other that I venture to refer to, since it was raised this morning. It was then suggested by a witness that control and nationalisation are, in effect, antitheses. It was suggested that the American plan was the opposite of nationalisation. I do wish to point out, if I may, that that would be a misreading of the American plan. That plan was specifically intended to cover both production in state factories and in private factories. The plan makes that perfectly plain, and the American delegate, Mr. Wilson, repeatedly emphasised that point. At one juncture, for instance, the Russian delegate raised the point that the American plan would weigh exceptionally hard upon state factories. The American delegate assured him in reply that it was intended to apply with exactly equal force both to state factories and to private, and that if there were any need for an adjustment of the kind suggested he would be willing to see whether the point could not be met. I mention it because, you see, any scheme of control that would be acceptable at all must be one that can apply to countries whose manufacture is wholly in the hands of the state, or countries whose manufacture of armaments is wholly in the hands of private firms, and also to countries like our own, where the system is a mixed one, partly state-owned and partly private. It is important to recognise that control, supervision, publicity, may apply both to state manufacture and to private, and will be necessary whether we choose to adopt an extended nationalisation in the armament trade or not. The two are not antitheses, as was suggested by the witness this morning.

I do not suggest that the state should take over the entire iron and steel industry, or the entire chemical industry: I am not arguing that the state should undertake the manufacture of every part of every weapon: I am not claiming that the state ought to try to disentangle state-owned armament factories completely from privately-owned ones. What I do submit is that by one means or another, the profit-motive must be and can be taken out of a business so closely "connected with the public interest" as armament manufacture. The state should reserve to itself alone the responsibility for making such weapons as tanks and artillery, submarines and military aircraft. And I submit for consideration (though here I express only a personal opinion) that the manufacture of armaments by the state, or manufacture by private firms on a cost basis, need not necessarily be entirely separated physically from the manufacture of non-military goods by private industry. In some cases the state might take over, in the complex of a great industry, those complete buildings and plant which are principally used for production of an exclusively military character; and that state-owned plant might on occasion be made available to the private industry, on payment of regular charges, at the discretion of a national armaments board. This is not a Utopian project: it is what this country actually did on a large scale during the war.

Many of the men who helped to direct the system of separate accountancy which made it feasible are still living: and I venture to suggest for the Commission's consideration that some of these men, who had experience of the costing system in the Ministry of Munitions, might perhaps be invited to give evidence here.

22 May, 1935.]

Mr. WILLIAM ARNOLD-FORSTER.

[Continued.]

I have raised this point partly in order to bring out the point that the extension of state manufacture to cover the completing stage of the great casualty-producing weapons need not and should not involve a dislocation of heavy industry or a vast programme of replacement of existing armament factories or a building of many new arsenals.

In conclusion, those organisations on whose behalf I speak are convinced that the motive of private profit affords a stimulus to armament production which is socially injurious; and that so long as national armaments are required, their supply should be limited and regulated under thorough supervision. All these organisations endorse the proposition that the state should assume direct responsibility for completing the manufacture of all casualty-producing weapons. And in their view, this suppression of manufacture by private enterprise should not wait upon a general agreement in favour of such suppression in all arms-producing countries, though it should be carried out within a system of international supervision such as the American plan would provide.

I cannot sit down, Sir, without thanking you for listening to me in making so much too long a statement.

491. *Chairman*: You have stated your case very fully and very clearly, and there are very few questions I want to ask you; but with regard to the last paragraph in your statement, which you have just read, you say that "all these organisations endorse the proposition that the state should assume direct responsibility for completing the manufacture of all casualty-producing weapons." Now, you recognise, do you not, that there are practical difficulties in carrying that out? Take, for instance, one thing that is in my mind. How would you propose to deal with aeroplane engines, because although I do not understand the thing very clearly I do understand, I think, sufficiently that an aeroplane engine may be used either for civil purposes or for military purposes? You cannot distinguish; it is the same engine. Well, how would you deal with a practical difficulty like that? At what stage would you say that the state should interfere?

Mr. Arnold-Forster: I think, Sir—and, of course, that is the reason why you chose the example—that that is much the most difficult of the problems that this proposition presents. Plainly, as you say, those aircraft engines can be used—at least in some degree—whether for military or for civil 'planes. That is one of the reasons for my earlier reference to the possible weakness of the licensing system. Colonel Carnegie has, I think, suggested that it would be advisable, in so important a case, for the state to take over the whole manufacture of naval and military aircraft. I have in my statement suggested that one contribution to the solution of the problem is to abolish entirely by international agreement, as our Government and other governments have proposed, all naval and military aircraft. That is, of course, a corollary not irrelevant to the subject, but outside the terms of reference, as I recognise, of this Commission; but, to answer your question, Sir, may I give an illustration of the kind of distinction that I think could be more easily drawn. In the manufacture of a warship you require armour plate. In the manufacture of that armour plate you use plant which is used solely, I believe, for that purpose; if not used solely, at any rate used preponderantly for that military purpose. You could not require that the state should take over the whole of the iron and steel industry; I am not suggesting that; but you could require that the state should take over that plant which is devoted to the manufacture of armour plate and you could require that the state should take over those sheds, that plant, which is devoted to the purpose of making the great gun barrels. That plant is of course required for no

other purpose than its military purpose, and I submit that there is no insuperable difficulty, as these various governments have suggested, in establishing, not with a hundred per cent. precision, but in establishing adequately, a point at which it is desirable that the state should take over that responsibility; my point being this, that it is not necessary—it is not practicable, if you like—for the state to have a hundred per cent. control over the whole field of contribution to armament manufacture: what is necessary is that the state should have control at the neck of the bottle. The state should have control over the completing stage of the production of those weapons without which war between organised modern states cannot be conducted with hope of success; and that, so far as I have been able to learn, is not an impracticable definition to draw.

492. *Chairman*: Then you make a reference, as other witnesses have made a reference, or are going to make a reference, to the McKinnon Wood Committee. Well, I do not know whether you know of the position with regard to that Committee, but we have ascertained that no shorthand was taken at all of the evidence of the witnesses, but the secretary, who seems to have been able to take notes in shorthand, took some notes in shorthand, and he reproduced those notes as minutes of the meetings; and one copy at least—I do not know whether there is more than one in existence—of those minutes has been discovered, and it is in our possession; and therefore we are able to deal with such material as there is in existence with reference to the McKinnon Wood Committee.

I have read the evidence. I think there were eight meetings of the particular sub-committee that dealt with the question of Woolwich, and their attention was directed almost entirely to the capacity of Woolwich for the uses to which it should be put in the future, and there was only one witness called who was not either an official or a member of either the Army or the Navy, I think. That one witness was Sir George Buckham, the chief designer of Messrs. Vickers, and he was called in order to give evidence to show what the difference in system at a private firm and at Woolwich was, and there was no evidence taken at all as to whether or not in the future the system should be a purely national system, or whether private factories of arms should be continued; and as far as I can see from the evidence, the remark in that report which you quoted arises from the fact that one witness, in giving his evidence, suggested that Woolwich should remain only as a sort of nucleus for research, and so forth, and that private armament firms should be subsidised; and in answer to that evidence, the Committee make an observation, which appears in the minute, which seem to be the foundation of what they report in the passage you have read; and of course one must remember that at the time they reported, it really was assumed that the peace that would follow would probably prevent the necessity for the manufacture of arms to any extent. That is the best conclusion I have been able to come to in reference to this report of the McKinnon Wood Committee, and I mention it, of course, because I may be under a misunderstanding. It may be that some member of the Committee who hears what I say or reads what I have said may correct it.

Mr. Arnold-Forster: May I thank you for that information, Sir, which I am sure will be of much interest to those who have studied this report without knowledge of what lies behind it.

493. *Chairman*: If you will forgive me for a moment, I could refer to the evidence. The evidence I refer to was the evidence of Major-General the Hon. Sir F. R. Bingham, member of the Munitions Council—

"(1) That Woolwich as the future Main Supply Arsenal was out of the question. Geographically, it was wrongly situated,

(2) But Woolwich must be the nucleus of the munition-producing capacity of the country and the

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

parent of all factories making practically every type of gun and ammunition and component, and for which there must be a unit of production maintained constantly up to date. This was necessary not only to maintain a small reserve but to enable—

(a) Experimental work to progress; and
(b) Foremen to be trained so that they could be sent out to factories throughout the country.

(3) Woolwich should keep drawings of all the gauges that were likely to be required. He was in favour of Woolwich keeping a stock of gauges, but appreciated that patterns changed so frequently and such an enormous stock would be required that this would be out of the question. He desired to emphasise, however, that at the beginning of the war the universal demand of manufacturers was for gauges.

(4) That some of the armament firms should be maintained (possibly by means of a subsidy) in a state of readiness to produce munitions immediately a war was imminent, and that, with the exception of one or two, the New National Factories should be closed down and left dormant, their machinery being stored."

Then this is what it says on the minute:—

"The Committee discussed these expressions of opinion, and the views were expressed—

(a) That the annual demands for munitions after the war would be comparatively so infinitesimal that the armament firms could not be expected to be kept going for munitions work, and that future Parliaments in all probability would not permit of subsidies being granted.

That it would be possible in future to watch the progress of munitions in other countries with a view to ensuring that if a war should come, it would not find us wholly unprepared."

I myself think that the ultimate report which you have read is founded upon the expression of opinion of the Committee, having heard this evidence, that the armament firms could not be expected to keep going for munitions work, and that future Parliaments in all probability would not permit of subsidies being granted. I say that in order that if I am wrong we may be corrected, because apparently the impression has got about that there was a distinct finding, after evidence, on the question between nationalisation and private factories.

Mr. Arnold Forster: Thank you. May I be permitted to add one word, or rather a question, in response to that?

494. Chairman: Yes.

Mr. Arnold Forster: I note in the summary of the main conclusions of that Committee, the statement which echoes the statement made in 1907 by the Murray Committee, that the arguments in favour of the retention of a Government arsenal for munition manufacture in peace-time are overwhelming. That is one point. The other point, the one that I read, seems to go further than that. It goes so far as to say that it is probable that the country will insist on the production of all armaments being confined to Government factories. The very important point that you have brought out, Sir, is that that conclusion was based more on the anticipation that there would be a great reduction of armaments, and that the private firms would have to be sustained by subsidies, more on general considerations of that kind than on any detailed evidence; but I venture to suggest that it does not necessarily show that the inference that I drew from that statement was unsound.

495. Sir Thomas Allen: May I interpolate, Mr. Chairman, on that point, that it is within my memory that after the Woolwich Arsenal Inquiry had been completed, the workmen there felt that they were experiencing depression, and they had an interview with the Prime Minister, who was then Mr. Lloyd George, on the 4th December, 1918. A

deputation waited upon him with regard to the placing of munition contracts, etc., with private firms, and the Prime Minister, in his reply, made this observation: "It is common knowledge that during the war, in point of time, Woolwich Arsenal saved the situation on more than one occasion," and he further stated that it would be "a very great national disaster if Woolwich were not used to its fullest capacity for the work of peace." I think possibly that some impression in your mind might have arisen out of a statement like that, perhaps.

Mr. Arnold-Forster: Thank you.

496. Chairman: In the earlier part of your statement, you refer more than once in terms such as these: "... but that is not the real point at issue." When you use that expression, you mean, I assume, the point at issue, or the point in issue, which is for the Commission to deal with or to decide.

Mr. Arnold-Forster: All I meant was this Sir, that when I referred to particular cases—such as the now fairly well-known letters which have been cited in Parliament in regard to certain correspondence of Sir Charles Craven of Vickers—I was especially anxious to stress that the case I was submitting was not simply that that case should be examined into with the purpose of dealing with whatever might result from such an inquiry in a particular case. The issue that I was submitting to you, and that, I assume, Sir, you are directing the Commission's attention to, is the major issue that underlies all that—not any question of little personal issues of that kind—but the great issue as to what are the grave objections alleged to exist, and what, above all, are the remedies which may be found for those grave objections. In other words, I was anxious to make the point that I am not urging that there should be any chasing off after a red herring. I was anxious to emphasise that I was not merely dragging up personal issues, for the sake of doing so, but only adducing them as illustrations of a case far more important than any instance of that kind.

497. Chairman: I follow that. Now, I think, there is only one other matter that I want to ask you about. You say: "Messrs. Vickers have, it is now disclosed, been paying large sums derived from the British taxpayer to the Electric Boat Co. in the United States." I do not follow why the money is said to have been derived from the British taxpayer.

Mr. Arnold-Forster: Well, Sir, my submission was that the payments were made from the naval estimates to Messrs. Vickers, and that out of the profits received by Messrs. Vickers, large amounts were paid to the American firm.

498. Chairman: But they do not make profits out of the taxpayer, do they, largely? Their profits are largely, or mainly, made from civil business and profits derived from contracts and sales all over the world. It is not the British taxpayer?

Mr. Arnold-Forster: I am sorry; I have not made the point plain. No, I was referring expressly and solely to the business with the British taxpayer, with the British Admiralty. The reference is made in this Exhibit, to which I have given the reference number—I have the document in my hand if you would care to see it—which refers solely to orders for warships placed by the Admiralty with Messrs. Vickers in respect of which Messrs. Vickers paid over certain sums received from the Admiralty to the American company. That at least is the statement that appears in this Exhibit No. 8.

499. Chairman: I follow that. Thank you.

500. Professor Gutteridge: But those payments would be in respect of patents, would they not?

Mr. Arnold-Forster: Yes; they are described as royalties.

501. Professor Gutteridge: It is part of an ordinary business transaction as far as I can see. I am afraid, at the moment, I utterly fail to see the wickedness of it. If the patents of the American company are used in constructing submarines, surely

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

there is nothing wrong in Vickers paying something for them?

Mr. Arnold-Forster: I was at pains to say that I imputed no such wickedness at all. The question I raised was whether, in connection with this, the agreement in question had been kept secret from the Admiralty.

502. Professor Gutteridge: I have got your point.

503. Chairman: However, I think you and I are agreed upon this, that when you come later on in your statement to deal with the remedies, you deal with them as the major point.

Mr. Arnold-Forster: Yes.

504. Chairman: I thoroughly agree with that.

505. Mr. Spender: Mr. Arnold-Forster does not really mean to suggest, I take it, that the failure to come to an agreement with Germany was due to any of Mr. Mulliner's activities, or the failure, even, of the naval holiday in 1912?

Mr. Arnold-Forster: No, Sir. I said: "I do not suggest, of course, that Mr. Mulliner was the main cause of Anglo-German naval rivalry. That would be a fantastic exaggeration." Those are the words that I used. "But," I said, "I do suggest that the sequence of events which followed upon that advice given by an interested party has a lesson for us now." That, I submit, is strictly true.

506. Mr. Spender: That is not very important, is it? Take the number of British battleships in the year 1913. It was Mr. Churchill's opinion, was it not, that they needed very much strengthening, and it was not Mr. Churchill's opinion, as you might infer from the way you put it, that the increase to the Navy was excessive, because in December, 1913, he proposed a very large increase, and that caused, as you will see in his account in *The World Crisis*, the Cabinet crisis in 1913 and 1914. That was presented to the Cabinet in a volume of eighty pages, and he gave a very picturesque account of the fight over it; so it could not have been Mr. Churchill's opinion that the increases in the Navy were excessive up to that point?

Mr. Arnold-Forster: I should not venture, Sir, to take Mr. Spender on, if I may say so, on the history of that period, and I certainly should not venture to suggest that Mr. Churchill would ever have been satisfied with the amount of increase of armaments that he was able to get out of the Government; but I would only say this. I am sorry if my argument was misleading. My only point was this. Mr. Churchill said, most justly as I think, in his book, that he had worked for peace, that he had proposed a naval holiday with Germany, and that that holiday had been prevented. When history threw its light upon those incidents it was found in the Von Tirpitz memoirs that Von Tirpitz had been helped in getting through his supplementary naval bill by the Mulliner scare, which he referred to by name. That was the only point I wanted to make, and I should be sorry to put forward an argument that was misleading.

507. Mr. Spender: It is not so very important.

Mr. Arnold-Forster: Indeed, I thank you.

508. Professor Gutteridge: You have the McKinnon Wood Report before you?

Mr. Arnold-Forster: Yes.

509. Professor Gutteridge: I think one thing they stressed there, too, was this, was it not, that in 1919 there were a very large number of men in this country who had been trained in the making of munitions; I think they call it a large educated reserve or something like that?

Mr. Arnold-Forster: Yes. The words appear at the end of my quotation. They are crucial, I agree. The point that they made was that at the end of the war a great many people did know about armaments manufacture, and therefore there was that reserve available. "The real reserve for war"—I am reading the sentence I quoted—"is the whole of the manufacturing power of the country, which has been

educated in the supply of armaments." You will recall that the same conclusion was reached in the impressive volume published by the United States in regard to the history of their munitions effort.

510. Professor Gutteridge: Yes. Thank you.

511. Sir Thomas Allen: You say: "I submit that by one means or another, the profit-motive must be taken out of a business so closely connected with the public interest as armament manufacture." You also agree with the American plan. Could you enlighten us as to how far, if at all, the American plan meets the object of taking any profit out of war?

Mr. Arnold-Forster: Well, Sir, it would eliminate, as I think, a great deal of the evils of the present system, because it would do a great deal to reduce the danger of solicitation for orders in secrecy. If the American plan went through in unmodified form, the placing of orders would be followed by publicity, and that would mean that you would know what orders were being placed, and would be able, if the American plan has its proper sequel, to ensure that the arms imported into each country were within the limits of a general disarmament convention. Well, of course, that is not provided in the treaty. The point about taking profit out of war would not be covered by the American plan, except to this extent, that it might eliminate that excess profit, that element in the profit, which is derived from such touting for orders as would be thus cut out. But, of course, as I sought to emphasise just now, the American plan is intended to cover both production in state factories and production in privately-owned factories; it would apply, in other words, to a country like Soviet Russia or a country like Great Britain, the one of them having its whole armament manufacture in state factories and the other having a mixed system such as ours.

512. Sir Thomas Allen: The American plan does not at all interfere with the present system of private production?

Mr. Arnold-Forster: Not the least, no. The Americans have, as you know, projects in hand for further measures to take the profit out of war, and the American Arms Inquiry was held, as you remember, largely at the instance of the American Legion on that very slogan, "Take the profit out of war."

513. Sir Thomas Allen: Still leaving the manufacture in the hands of private enterprise?

Mr. Arnold-Forster: Yes, certainly.

514. Sir Thomas Allen: Just one other point. You favour a system of nationalisation, at the same time reserving to the state that part of armament production which renders it unfit for pacific purposes, and destines it exclusively for military use. The Chairman has already put a question to you in respect of aeroplanes. I would like to ask at what point a battleship becomes unfit for pacific purposes, once laid down?

Mr. Arnold-Forster: Well, I should say from the word "Go." I thought the answer to that was plain. It was once maintained, I think, by a British admiral at Geneva that battleships, more precious than rubies to those states which possess them, are purely defensive weapons, almost always purely defensive weapons, almost always used for the purpose of defending convoys; but it was not a view which commended itself to most of the other countries who were not possessors of a great battle fleet. The point there, I should have thought, was quite a clear one. It becomes much more difficult in the kind of case that the Chairman put; but may I be allowed to add one word to that. Obviously there are many parts, many elements in the making of a battleship which a state need not make itself wholly responsible for. There are all sorts of parts fulfilling functions of various sorts, parts which, when a battleship is broken up, one is able to buy for one's back garden or one's doorstep; and those fittings may be made by private firms, and will be secured under the direction of the armament board, or by the contract departments of the fighting services, as now.

22 May, 1935.]

MR. WILLIAM ARNOLD-FORSTER.

[Continued.]

515. *Sir Philip Gibbs*: I take it that all the societies for which you are speaking do actually insist upon nationalisation—that is to say, that is a very strong part of their programme and of their hopes?

Mr. Arnold-Forster: Yes, that was, to me, the impressive feature of the support given to this memorial. I confess I had not expected the response to be so unanimous and wide. The last paragraph of my statement was quoted practically verbatim from that memorial, which has their official endorsement, and I was at pains to quote it so in order to depart in no detail from what I was properly authorised to say.

516. *Sir Philip Gibbs*: Several witnesses who have come before us, including Major Hills this morning, suggested that nationalisation is not really an absolute cure for a great many of the evils which are alleged against the traffic in arms; that we may have confidence in our own government, but that other nations with less confidence might find themselves in the position, really, of making arms for government trade with other countries. Do you think, yourself, that there is any likelihood of that danger? Supposing you have the nationalisation of arms in some countries; they then proceed to manufacture great quantities, and then tout in other countries. How would you deal with that?

Mr. Arnold-Forster: May I say, with great respect, I am grateful for that question. The nationalisation of armaments, as I sought to emphasise to you, would not, in my judgment, remove all the difficulties that we have to face. Plainly, the problem of limitation would remain. Plainly, there is no means of dealing with that problem short of a general disarmament convention. There is no other means of dealing with it at all. I venture to stress that point—that if you had an unlimited market both for government factories and private factories, they would be competing for that market. The exports, whether from state factories or private factories, would be exports into an infinitely expandable market, and, as the American Inquiry has amply shown, the governments have been back of the private firms in seeking to secure for their nationals the lion's share of their business. That is one of the chief points I made; and I should like to emphasise my agreement with the view that nationalisation by itself, if it will solve some, will not by any means solve all of the difficulties. Obviously it will not. Certainly the fact that a particular state has got an extended system of

nationalisation in six arsenals, like our own country, will not, for that country, remove all the evils of the trade, any more than it would in Soviet Russia. And if there was any substance in the submission I have made it will, I hope, be found in the coupling together of those four items: (1) a supplementing of the system of licences; (2) an acceptance of the American plan, which I think is the most urgent step; (3) the consideration of the formation of a national armaments board; and (4), but as linked up with those, that measure of nationalisation which I suggested.

517. *Sir Philip Gibbs*: Of course, most of the points you have raised do not lead us to question you; you understand that. It is other people who must be questioned on all the points you have raised, and therefore, really, there are no further questions to ask you, as far as I am concerned.

Mr. Arnold-Forster: I am much obliged. I was only afraid I had suggested too many points.

518. *Chairman*: It is nearly the time when we usually adjourn, but we were told that there were a considerable number of people who desired to come and support your statement. Well, having heard you, I venture to ask whether there is anything they can usefully add?

Mr. Arnold-Forster: It is not for me to speak for them.

519. *Chairman*: Except, of course, to support your statement in the sense of emphasising what you have already told us, that they agree with what you have said. Do you follow what I mean?

Mr. Arnold-Forster: Yes, Sir. If you ask me as a question, I would express the hope that you, Sir, may ask them, because I cannot help thinking that it might be of interest to the Commission to hear the brief statements that they may make as to the views of the very large organisations which they represent.

520. *Chairman*: May I take it from that that their views are correctly represented in your statement, because if so, we would be glad to hear them to-night and close this part of the examination; but if they want to make any sort of lengthy statement they would have to do it to-morrow. That is what I want to bring before them.

Mr. Arnold-Forster: It is not for me to speak for them on this, but I venture to give an assurance on their behalf that they will not speak long.

(The Witness withdrew.)

Mrs. HARTREE, Acting Vice-President, National Council of Women, called and examined.

521. *Mrs. Hartree*: Mr. Chairman, I speak as a representative of the National Council of Women of Great Britain, which consists of 85 branches and 132 societies. It is a constituent member of the International Council of Women, consisting of 34 national councils. I speak as expressing the deep concern of public opinion in this question of "taking the profit out of war." Both Councils have taken great and continuing interest in all questions dealing with international problems, and both have standing committees studying such problems and reporting on them to the Councils, and I have here a list of resolutions passed by the I.C.W. and also by the N.C.W. (if I may shorten myself by those initials) in full session during the last few years, from which I should like to read the following:—

"The International Council of Women welcomes the proposals for the drastic control of the manufacture and trade in arms recently adopted by the Committee for the Regulation of the Trade in and Manufacture of Arms and Implements of War at the Disarmament Conference."

I might say that this resolution was passed in

July, before the American proposals of November were put forward—

"It urges the National Council to work for the acceptance of these proposals by their respective governments so that they may be included in a general disarmament convention the conclusion of which is indispensable if the race in armaments is to be stopped."

That resolution was confirmed in a large gathering of the National Council at Edinburgh last year in October, with only three dissentients out of over 500 delegates. It also passed at the same time—the National Council I am speaking of now—this resolution:—

"The National Council of Women urges the Government to introduce measures which will take the manufacture and sale of armaments out of private hands and place them under national control."

That was passed also by a large majority, though there were rather more dissentients. Those were the resolutions.

22 May, 1935.]

Mrs. HANTREE.

[Continued.]

I speak not in any way on the moral issue of this question at all, though there are some of our members who feel strongly on the moral issue of the manufacture of armaments by private firms. I speak from the common sense point of view that manufacturers, of whatever commodity, must obviously desire expansion of demand, and therefore naturally take all steps possible to increase that demand. In

the case of armaments such steps include the constant inflaming of public opinion in different countries against each other, of which there is overwhelming proof both before and since the war. It is extremely doubtful whether national and international control and supervision would be sufficient to abolish these activities, and we therefore support the memorandum put forward by Mr. Arnold-Forster.

(The Witness withdrew.)

Mr. S. F. PERRY, Secretary, Co-operative Party, called and examined.

522. Mr. Perry: Mr. Chairman, I think it would be unfair to take up much of your time, as I have had the advantage of listening to a great deal of the statement from Mr. Arnold-Forster, but I do want to speak on behalf of the Co-operative Union of Great Britain with a membership of 7,000,000 in Great Britain, mainly householders; and if you will take the average size of the family you will easily appreciate that we can speak with some knowledge of the feelings of one-half of the people of our country. We have had the opportunity of considering the memorandum and the general policy outlined in it. It has been the subject of discussion at our annual conferences, sectional and district conferences, and we are here to give our whole-hearted support to the general policy laid down by the National Peace Council.

You will appreciate, Sir, that our movement, composed largely of working men and women, has perhaps not gone so deeply into the technical side of this problem as outlined in some of the questions we have had here this afternoon; but I think there are

few people in this country who have deeper and stronger feelings on this matter than we have. I can plead guilty to playing my part in trying to increase the feeling of our Co-operative movement on this matter by one personal experience; and with that I will close. Some years ago I had the opportunity of speaking in the town of Bedford. In the interval before the meeting I was walking round the town, and saw one of the usual war trophies. On that trophy there is a brass plate with this inscription: "Presented to the town of Bedford by the 5th Bedfordshire Regiment. Captured at Gaza." As I read that plate, I pictured the deeds of heroism of the young boys of the Bedfordshire Regiment, and I knew, too, of some of the desolate homes in Bedford. Then I walked round to the other side of the gun, and on the other side of the gun there is an inscription in much larger letters. That inscription read: "Made by Sir George Armstrong Whitworth & Co."

(The Witness withdrew.)

Mr. FREDERICK CECIL WOODS, Member of the Executive Council of the Union of Post Office Workers, called and examined.

523. Mr. Woods: As a member of the Executive Council of the Union of Post Office Workers it is my privilege to represent over 105,000 Post Office employees. We think that it is not unnatural, with the experience gained as a result of our direct association with a great national service such as the Post Office, that the members of our organisation are led to the conclusion that whilst arms of any description are necessary; the efficient manufacture and control of such arms can only be maintained under a nationalised industry. It is anticipated by my Executive Council that witnesses who appear before this Commission who may be associated with the production of arms for profit will endeavour to discredit the efficiency of government departments and the staffs employed by such departments, and will refer to the absence of initiative displayed by government employees. This statement will be made, probably, in spite of the fact that every

Select Committee or Royal Commission that has inquired into Post Office administration has paid tribute to the efficiency of Post Office employees. Thus the suggestion of a lack of initiative, or of inefficiency, on the part of government departments or their employees is without foundation, and we refer to the undeniable success of the Post Office as a nationalised industry, an industry with which my Union is associated.

May I add that on every occasion that the subject of peace or nationalisation has been before the annual conference of my Union the principles advocated by Mr. Arnold-Forster's evidence have been supported either unanimously or by an overwhelming majority. I therefore confidently desire to associate the members of the Union of Post Office Workers with the evidence submitted on behalf of the National Peace Council and other associations by Mr. Arnold-Forster.

(Adjourned to to-morrow at 11 o'clock a.m.)

APPENDIX

STATEMENT SUBMITTED BY THE NATIONAL PEACE COUNCIL AND ORGANISATIONS ASSOCIATED WITH IT FOR THIS PURPOSE

The following expression of views in regard to the matters raised by the terms of reference of the Royal Commission is submitted in the name of the under-mentioned organisations:

Auxiliary Movement.
Baptist Ministers' Pacifist Fellowship.
Baptist Union of Great Britain and Ireland.
Congregational Christian Pacifist Crusade.
Church of Scotland Ministers' Peace Society.
Co-operative Union, Ltd.
Friends Peace Committee.
International Friendship League.
National Co-operative Men's Guild.
National Council for Equal Citizenship.
National Council of Women.
National Guild of Co-operators.
National League of Young Liberals.

I. THE GENERAL CASE.

1. Paragraph 1 of the Royal Commission's terms of reference calls for report on the desirability of prohibiting private manufacture of and trade in arms; and paragraph 2 calls for report on whether there are any steps to be taken to remove the "grave objections" to which private manufacture is stated in Article VIII of the Covenant to be open. Evidently, these questions do not admit of an adequate answer until the grounds for objection to private manufacture have been thoroughly examined.

2. In the Council's view, grave objections do undoubtedly exist: and the Council finds extraordinarily widespread support from public opinion on this point. The anxiety expressed by the authors of the Covenant is widely shared in many European countries, not least by the ex-service men, who united to present an impressive memorial on this subject to the Disarmament Conference in 1933. It is keenly felt in the United States, where the demand of the ex-service men that measures should be adopted to "take the profit out of war" contributed to the decision to hold the Senatorial Inquiry into the arms trade: and President Roosevelt (May 18th, 1934), referring to the dangers of a "mad race of armaments", declared that "this grave menace to the peace of the world is due in no small measure to the uncontrolled activities of manufacturers of and merchants in engines of destruction". The French Government (1933) called for suppression of the manufacture of armaments by private enterprise; or, failing that, for drastic control by international as well as national means. Throughout Great Britain, the Council and each of the organisations here represented have found evidence of the deep concern of public opinion about this question, and of the widespread desire, even in centres of the munitions industry, that the manufacture of war material should no longer be subject to the

motive of profit-making. We understand that one of the associated organisations—the Women's International League—is submitting to the Commission detailed evidence in support of this assertion.

3. The main ground for objection is, in the Council's view, inherent in the nature of this trade and does not require for its demonstration any research or documentary evidence. The manufacturer of armaments for private profit *must* desire the continuance of conditions in which there is a demand for his products: and he *must* be under temptations to stimulate, by whatever means are open to him, that demand. In the case of some commodities such stimulation of demand has no evil social consequences; but in the case of armaments, as in that of noxious drugs, it is open to the gravest objections. The business is perfectly legitimate so long as society allows it to continue; but society cannot well be indifferent to any motive-force which, by tending to increase armament and counter-armament, stimulates mutual apprehensions and suspicions, prevents the general disarmament that the world urgently needs, and imperils "the peace of nations".

It would, indeed, be absurd for manufacturers of armaments to contend that they do not desire the continuance and expansion of their business.

4. If any such contention were, nevertheless, to be put before the Commission, it would suffice to refer, in reply, to the mass of evidence already published and available to the peace movement of the world. This includes the admissions of Mr. Mulliner and other facts of the Mulliner case (1908-10); the Vickers-Mitsui case (1914); the Shearer case (1927-29); the Seletzki case (1933); the admissions by the representative of the Remington Co. in the American Embargo Inquiry (February, 1933); and much of the evidence produced before the United States Arms Inquiry (1934-35). The letters of Captain John Ball of Soley Armament Company, Ltd., to the Electric Boat Co. of the United States contain allusions to bribery on a large scale, into which, the Council hopes, the Commission will inquire; and these letters reflect the mutual interest of the armament firms in a general expansion of the demand for armaments. It is presumably this motive which has prompted the great armament makers to pass on orders to their competitors (e.g. in the case of the Electric Boat Co. shown as passing on orders to Vickers Ltd.) and to share their patents for war-material (e.g. in the case of the Electric Boat Co. and Vickers Ltd.).

The statement has often been published, we believe, without being controverted, that M. François de Wendel, President of the Comité des Forges, closely associated with Schneider-Creusot, has acquired a controlling interest in the "*Journal des Débats*," and is the head of a group which, in October, 1931, jointly with the French coal cartel, purchased a controlling interest in "*Le Temps*"; M. de Wendel is also stated to have interests in the management of the "*Echo de Paris*" and "*Matin*." The Du Pont Company are stated to own three newspapers in the State of Delaware. It can hardly be doubted that such control over organs of the press by those concerned with the sale of armaments for profit is due, in some degree at least, to the desire to promote the demand for armaments.

Much of this published material is of unquestionable value as it stands; a good deal of it is based on frank admissions by the parties concerned: some of it, no doubt, requires further examination before it can be regarded as of evidential value. The

Council hopes that the Commission will undertake this examination with unflinching thoroughness and full publicity.

5. Besides the material already available to the public, there is presumably a mass of relevant evidence still undisclosed. The Council hopes that the evidence upon which the McKinnon Wood Committee in 1919 reached its conclusions will be made public; and that the Commission will insist on taking testimony on oath, wherever called for, and will require the production of all documents which may throw light on the "evil effects" alleged in the Covenant.

6. The Council believes it to be clear, from the evidence already available, that armament firms have accentuated the armament race by playing off one country against another and have prolonged wars by simultaneous arming of both belligerents; have sought to influence public opinion through the control of newspapers and by stimulating Press campaigns for increased armaments; have disseminated false reports concerning the military programmes of various countries; have attempted to bribe and influence Government officials both at home and abroad; have sent paid agents to seek by false propaganda to defeat the efforts of international conferences for disarmament and peace; and have derived profit through the arming of countries which might easily become enemies of their own country.

7. So long as the export of armaments for private profit continues, it is likely that the Governments of those countries in which armaments are manufactured and exported for private profit will generally desire that the export trade of the armament firms within their territory should be as large as possible, short of the point at which national security would be obviously and directly prejudiced. The United States Arm Inquiry has afforded many evidences of the desire of the governments to facilitate and promote armament sales in foreign countries by their nationals; and it has been indicated, by answer to a question in Parliament, that the British licensing system, valuable as it may be as a means of control in case of special need, does not have the effect of withholding more than a trifling proportion of the licences actually applied for.

The Council believes that so long as the governments can look upon the private armament manufacture within their borders as a convenient means of rapid expansion of arms production for themselves in time of crisis, there will be an objectionable tendency to stimulate the increased demand for armaments.

8. The Council and the associated organisations therefore consider it to be clearly established that the manufacture and sale of armaments for private profit, unregulated as it now is, is gravely injurious to the public interest.

II.—REMEDIES.

9. In submitting the following opinions as to the best practicable remedy in existing circumstances, the Council feels obliged to make clear its opinion that the trade in arms and its control must be seen as part of the wider problem of the prevention of war and the organisation of a peaceful and co-operative world order. The root of the matter lies in the

international anarchy—in the economic rivalries and unresolved political differences which lead to military preparations and the demand for arms whether manufactured by private enterprise or by the State. In its view a complete solution must therefore depend upon a genuine renunciation of war, the limitation, reduction and eventual abolition of armaments, and the development of a collective peace system based upon a universalised League of Nations.

10. **LIMITATION OF ARMAMENTS.**—The Council is unanimously of opinion that no mere licensing system for exports, imports and manufacture of armaments, however thorough, will suffice to prevent the major evils of the arms trade, unless limits are fixed for national armaments by international agreement. If the government of each country that exports armaments subjects those exports to a licence system, each of those governments will remain anxious, as it now is, that its nationals shall get a lion's share of whatever business is available: each government will continue (as the British Government has done) to grant practically every licence applied for, as a matter of course; and the main evils inherent in the touting for orders in a market capable of infinite expansion will survive. A comprehensive limitation of armaments is required, as the frame within which any export of armaments must be regulated.

11. **INTERNATIONAL CONTROL.**—The Council considers that a comprehensive system of licensing for exports, imports and manufacture, with inspection on the spot and publicity for orders, as proposed in the American plan now before the Disarmament Conference, would be a substantial step in the right direction. The Council and its associated organisations have been active in urging H.M. Government to withdraw its opposition to the proposals for inspection on the spot and publicity for orders, which they regard as essential elements of the American plan and necessary for the promotion of confidence where confidence is lacking. The Council hopes that the Commission will recommend to the Government the signature and ratification of such a treaty.

12. **NATIONALISATION.**—But the Council considers that the step referred to above would be insufficient. It urges that the State should assume direct responsibility for completing the manufacture of all casualty-producing weapons (e.g., as defined in the American plan). The Council endorses the view of the French, Spanish, Polish and Danish Governments (Conf. D./CG/48, 3rd March, 1933) that the object of the measures taken should be "to reserve to the State that part of industrial production which renders it unfit for pacific purposes and destines it exclusively for military use."

13. To sum up. The Council and the associated organisations are convinced that the motive of private profit affords a stimulus to armament production which is socially injurious: that so long as national armaments are required, their supply should be limited and regulated under thorough supervision; and that the manufacture of casualty-producing weapons should be taken over by the State.

In the view of the signatory organisations, this suppression of manufacture by private enterprise should not wait upon a general agreement in favour of suppression, but should be carried out within a system of international supervision.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

THIRD DAY

Thursday, 23rd May, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Mr. HARRY POLLITT, representing the Central Committee of the Communist Party of Great Britain, called and examined.

524. *Chairman*: Are you Mr. Pollitt?

Mr. Pollitt: I am.

525. *Chairman*: And in what capacity are you coming here? Are you the secretary of the Party?

Mr. Pollitt: I am representing the Central Committee of the Communist Party.

526. *Chairman*: A statement* has been submitted on their behalf. Did you prepare that yourself.

Mr. Pollitt: I prepared that statement in conjunction with the other people with whom I am associated.

527. *Chairman*: Has it been submitted to any representative committee, or is it merely the opinion of those who drew it up?

Mr. Pollitt: It is the considered opinion of the Central Committee of the Communist Party.

528. *Chairman*: I have read it through carefully. The earlier part of it contains a good deal of information that we have received before from other sources, and there is a certain amount of it that I think one could charitably say was not very relevant to what we have to consider; and, of course, from your point of view the important part comes under the head of "Conclusions and immediate recommendations", under Section VII. Would you be content to start with that, or do you wish to read the whole of it,—because if you wish to read the whole of it I should not say that you are not to do it. It rests with you whether you wish to read the whole of it. If you do, I should not stop you.

Mr. Pollitt: No, I do not wish to read the whole of the memorandum, because I want to save the time of the Commission a little; but I would like to amplify certain parts of the memorandum in order to show that it is based, in our opinion, on fact. Therefore it would be a question of quoting each section, drawing the attention of the Commission to the paragraph, and then amplifying the conclusions that we draw there.

529. *Chairman*: Very well; that will be quite convenient. It does not mean a long speech on each amplification?

Mr. Pollitt: I will make it as brief as I possibly can.

530. *Chairman*: I would sooner you read it as it stands than read part of it and amplify it.

Mr. Pollitt: I was hoping to draw your attention, for instance to paragraph 4, and then submit one or two facts in relation to that paragraph. It will be quite short.

531. *Chairman*: Very well.

Mr. Pollitt: In connection with the first section, in paragraph 2, we want to direct the Commission's attention especially to that sentence immediately after the percentage of world export of arms, where it reads: "The heaviest responsibility for the evils of the world arms traffic thus rests with Britain", and to ask that attention shall be given to this because of the present situation of rising armaments at the moment when the Commission is sitting; and that is all that we wish to draw attention to on that first section.

In connection with the second section, which deals with the destination of British armaments exports for the furtherance of wars and counter-revolution, we wish to draw the attention of the Commission to the significance of our statement where we point out the big increase in armament exports to Japan between 1929 and 1932, and to that formulation where we say: "At the same time as the League of Nations was vainly endeavouring to check this flagrant violation of treaties and aggressive war of conquest, British armament manufacturers were supplying the means for it to be carried out."

Then in regard to the next paragraph, on China, we believe that it is also useful to draw the attention of the Commission to this later return that we have obtained of the export of loaded cartridges to China, and then I hope to show why this has taken place, in accordance with what we say in the memorandum, that "British arms exports to China showed a steep rise; arms were poured in to support this counter-revolutionary war." I therefore want to direct your attention to the following figures. In 1929 this country exported to China 393,000 loaded cartridges, in 1930 847,000 loaded cartridges, in 1931 2,458,000 loaded cartridges, in 1932 7,735,000 loaded cartridges, and in 1933—these are the last figures available—33,202,500 loaded cartridges; and our submission to the Commission is that this tremendous increase in exports of this form of armaments coincided with their use for the suppression of the Chinese Soviets and the Chinese Red Army.

In support of that contention I want to direct the attention of the Commission to this extract from the official *Army, Navy and Air Force Gazette* for 8th November, 1934, which is headed "British Tanks against Communists":—

"Four 6-ton tanks, each equipped with one 47 mm. gun and one machine gun, and four light amphibian tanks, each equipped with one machine gun, have been supplied by British manufacturers to China, and are being used for the first time against Communists in Canton, who are retreating to Szechwan, where they hope to join the bandit Hu Lung and his company of 100,000 men."

* Appendix I.

23 May, 1935.]

MR. HARRY POLLITT.

[Continued.]

532. *Chairman*: I did not quite gather what you said about British manufacture. Did it mention a name?

Mr. Pollitt: No, it does not mention the name; but I want to submit to the Commission that it might be well worth inquiring about when Vickers send their representative, because the type of tank that we can prove—as far as specifications are concerned—was sent, was this type of amphibian tank, a type that Vickers specialise in. I have not the slightest doubt that Sir Eustace d'Eyncourt could also have thrown a little light on this particular form of transaction. We are submitting that this is rather important corroboration of the fact to which we are drawing the Commission's attention in relation to the purpose of this export of armaments to China.

Then, with regard to the paragraph headed "South America," where we are dealing with the figures of exports of armaments to South America, I think that the Commission will be interested, too, in this further quotation, which we took from the *Aeroplane*, of 9th September, 1934:—

"Air firms are no less quick to seize their opportunities. One of the most important persons in South America in relation to the development of British aeronautical interests is Sir Henry Joseph Lynch, financial adviser to the Brazilian Government and managing director of Davis & Pullen, of Rio. He is also ex-President of the Chamber of Commerce of Brazil, and is generally regarded as being connected intimately with Rothschild interests."

The same paper, the *Aeroplane*, at a later date, 3rd October, 1934, then follows this up: An indication of the direction of British aeroplane exports is shown by a remark in the *Aeroplane*. This is the actual quotation:

"In spite of the revelations of the United States Government Inquiry into armament graft, we do not believe that in selling armaments to foreign nations American salesmen are able to beat our own, and the fact remains that one British manufacturer, at any rate, sold enough aeroplanes to the various South American nations to make a very big hole in the difference between the sales of American and British products. Therefore the natural assumption is that the excess of American sales over British sales must consist of passenger-carrying aeroplanes and motors and other equipment for them"—and not, thank Lynch, of arms planes.

Our submission here is that an official journal representing the interests of what I choose to term bombing-war interests is, first of all, showing how valuable it is for them that they have this important contact in South America, Sir Henry Joseph Lynch; secondly, that we can beat the American salesmen at their own game; and thirdly, that even when they get a little of our trade we are thanking Lynch that their trade is only passengers, and ours is for the production of war planes; and we believe that that is a quotation to which the Commission should give its attention.

Then in the paragraph which is headed "Germany," we say: "The figures of British arms exports to Germany are not available; but the active British participation in the re-arming of Germany, contrary to Versailles, is common knowledge," and then we make a statement; but we believe that the Commission ought seriously to consider the statement that was made in Parliament on Tuesday of this week in connection with this German re-armament, especially because of the debate in the House of Commons last night, and the fact that in our opinion, having armed Hitler, we are now using that as a pretext to embark on an unparalleled armaments race in this country. This is the question that was asked in the House on Tuesday night by Mr. Bevan. I will read the actual extract from Hansard:—

"*Mr. Aneurin Bevan* asked the President of the Board of Trade the amount and the value of nickel imported into Germany from Canada for the years 1933 and 1934, respectively, and for the first three months of 1935 as compared with the first quarters of 1933 and 1934, and the amount and value which was exported direct to Germany and exported via Rotterdam, respectively; and whether, in view of the large proportion of capital held by British nationals in the firms involved, he will consider taking steps, in conjunction with His Majesty's Government in Canada, to prevent the continued participation of British firms in the re-armament of Germany?

Mr. Runciman: As regards the first part of the question, I am circulating in the Official Report a statement giving such information as is available. I am not aware of the proportion of the capital of nickel-producing firms that is held by British subjects. For the rest I can only refer the hon. Member to the reply given to the hon. Member for Dumfries Burghs (Mr. Kirkwood) by my right hon. Friend the Lord Privy Seal on 14th May.

Mr. Cocks: Is the right hon. Gentleman aware that by refusing to take any steps in this direction he is playing into the hands of Herr Hitler?

Mr. Runciman: I am not aware of that."

The statement* (to save your time) is here, giving the actual figures, both so far as the volume is concerned and so far as the value of these exports of nickel is concerned. You understand and appreciate the important part that this plays in war material for Germany. The significance of it is, as I say, that even now, while this Commission is sitting, we are embarking upon this tremendous arms race, that we have put Hitler into the position he is in, and having put him there we use that as the pretext for launching upon this tremendous expansion in all forms of armaments.

533. *Chairman*: Before you pass from that, I was going to ask you a question about it. You refer to British exports of nickel to Germany?

Mr. Pollitt: Yes.

534. *Chairman*: I understand now you are referring really to exports from Canada?

Mr. Pollitt: Yes, but by firms the capital of which is Canadian and British, and exports which could not be carried out without permission of the National Government.

Finally, on the whole of that section, Section II, where we have tried to make our case that this export of armaments allowed by the National Government actually fomented war, and also is used for the suppression of working-class struggles, we think it is necessary to put before the Commission a further conclusion, and that is the fact that if British soldiers are once more called upon to take

* OFFICIAL REPORT, Tuesday, 21st May, 1935, Col. 165. Following is the statement:

STATEMENT showing the total quantity and value of crude and scrap nickel (and nickel coin) imported into Germany during the periods stated and recorded as of Canadian origin.

	100 kg.	1,000 R.M.
Year—		
1933	6,885	2,131
1934	11,037	3,441
January-March—		
1933	612	(a)
1934	3,893	1,312
1935	—	—

(a) Not available.

NOTE.—It is not possible to state the proportions imported direct and via Rotterdam, but a considerable proportion of the imports is not consigned direct from Canada to Germany.

23 May, 1935.]

MR. HARRY POLLITT.

[Continued.]

part in a war, they are going to be slaughtered by the armaments and munitions produced by British firms. In this connection, Sir, I believe that it would be useful to draw your attention to the last meeting of Vickers, where even a military gentleman protested against the way that British armaments were used for the slaughter of British soldiers in the Dardanelles campaign. Major Marston said:

"I do not want to put any questions which the Directors might feel it inexpedient to answer. On the other hand, like our Chairman, I am an ex-soldier, and this is a point which particularly affects soldiers. You, Mr. Chairman, were concerned in Gallipoli. Although of course, you did not know it at the time, you must have learnt since that our men out there were being killed by guns and shells manufactured by the company over which you now preside."

We want to draw the Commission's attention to the fact that Britain, as the biggest exporter of armaments in the world, is exporting armaments that quite conceivably will one day be used against hundreds of thousands of British workers on the same terrible scale as in the war in the Dardanelles.

In regard to Section III—"British Government Complicity in the Operations of the Armament Trusts"—we make one or two statements for which the Commission will quite rightly demand further justification. In paragraph 7 we say: "The distinction between the 'private' armaments trusts and the Government and state apparatus is a formal one. The trusts are 'private' in so far as the profits of the war-trading are appropriated by the capitalist class in their individual capacity as shareholders. But their operations are conducted in complete collaboration with the Government and state apparatus, with which they are closely interlocked."

In proof of that, I draw your attention to the speech made by Sir Herbert Lawrence, the chairman of Vickers, at the meeting held on 2nd April, 1935, where he said: "Armament firms in this country carry on a legitimate business under strict control by Government departments", and to the meeting of Imperial Chemical Industries on the 1st May this year, when a shareholder asked if it were possible to separate the armament from the other business of the company, to which Sir Harry McGowan, the chairman, replied: "No, I am afraid it is impossible. We are in the hands of the Government."

Then in paragraph 8, in Section III, we are drawing your attention to the close interlocking of the armament trusts and the state, as expressed more clearly in the character of the personnel, particularly of Vickers Armstrong and of the I.C.I.; and in the support of that contention we draw your attention to the following directors and their past connections with the Government.

General Sir Herbert Lawrence has been chairman of Vickers, Limited, since 1926. He was formerly the Chief of Staff at the Headquarters of the British Government in France from January, 1918. After a distinguished military career in South Africa, in Egypt, in France and in the Dardanelles he left the army on the retired pay list in 1922.

Sir Mark Webster Jenkinson was the Controller of the Department of Factory Audit and Costs at the Ministry of Munitions, and Chief Liquidator of Contracts at the Ministry of Munitions after the war. He also is a director of Vickers now.

Another present director of Vickers, General Sir J. F. Noel Birch, after a long military career, was Artillery Officer to the Commander-in-Chief in France from 1916 to 1919. He was Director of Remounts, 1920-1921, Director-General of the Territorial Army, 1921 to 1923, Master-General of the Ordnance and Member of the Army Council, 1923 to 1927.

Sir J. A. Cooper, a further director of Vickers, was the Principal in charge of Raw Materials Finance

at the War Office from 1917 to 1919, and then became the Director of Raw Materials Finance at the Ministry of Munitions from 1919 to 1921.

Sir A. G. Hadcock was the Associate Member of the Ordnance Committee. Several other directors have had previous military experience.

Now, Sir, we submit to you that it may be all very well for public consumption that these gentlemen have now ceased all their government activities, but I think all of us know sufficient of the ways of the world, and personal and social relationships, to appreciate the point that these directors are only of service to Vickers precisely because of their government connections, their government experience, and in knowing that their participation in the boards of the armament trusts is the very best way to get for the particular firms they are identified with any government contracts of a war character that may be going.

535. *Chairman*: Would not you include in their experience their practical experience?

Mr. Pollitt: I would put far higher than their practical experience their personal and political connections, Sir, with the government ensuring Vickers the rate of profits that it would desire.

Then I think the Commission ought to have, in the same connection, their attention drawn to Major General Guy Dawnay. This gentleman is the chairman of Armstrong Whitworth Securities, a company very closely allied with Vickers. He also has had big government experience; and, Sir, we also take the liberty of pointing out that this gentleman's brother happens to be at the moment in one of the most important positions in the British Broadcasting Corporation. I leave the Commission to draw the conclusion from that that I am sure they will do.

Now, in furtherance of the same point that we are making, take the Imperial Chemical Industries. We quite frankly take our stand, Sir, on this position, that whilst this is a combine that can produce everything, from the raw material to make silk stockings and agricultural fertilisers, its chief importance, especially because of the new phase with which modern wars are conducted, is that it represents the most powerful combination in this country that can give the government the guarantee of the necessary supply of poison gas, high explosives, and all the new forms with which modern war is being conducted, and is being contemplated to be conducted in the future. We would hesitate, from our point of view, to make any sharp distinction in regard to the importance of the I.C.I. as a war industry as distinct from the role that is played by Vickers.

In order to substantiate again the contention that we are making in paragraph 8, we draw the attention of the Commission to the following: The Marquess of Reading, one of the most distinguished gentlemen in this country, is one of the directors of the I.C.I. As you know, Sir, he has been Viceroy of India, he has occupied many important government positions, and only as recently as 1931 was the Foreign Secretary to the first National Government. Sir George Christopher Clayton, the Conservative M.P. for Widnes, is also a director of this company, and Mr. W. H. Coates is a director of this company, and he, too, was in the War Office from 1907 to 1904. He was in the Inland Revenue Department from 1904 to 1919, and he was the Director of Statistics and Intelligence in the same Department from 1919 to 1925. But the chief thing that we want to draw your attention to in support of our contention is the position of Lord Weir, who occupied a very important role in this country during the last war, who is a director of the I.C.I. at the present time, who has had very close government connections and who, we learn from this morning's papers, it is contemplated shall be given a further important job in connection with the new phase of aerial warfare.

Now, in connection with paragraph 9 we wish to emphasise the way that the licensing system enables a government or the private trusts to supply munitions of war to both sides. I do not think

23 May, 1935.]

MR. HARRY POLLITT.

[Continued.]

any member of your Commission would doubt the fact that this terrible war in Bolivia and Paraguay would have been over long before now if this country and America had not been impartially distributing their favours to both sides. Similarly, in connection with this long-drawn-out war that is taking place in China—and, Sir, I am not now referring to the war upon the Chinese Red Army; I am referring to the continual skirmishes and battles that take place between the Chinese Nationalist Government and the Japanese Government. This country, through its export licensing system, undoubtedly is in a position to supply both sides.

But, Sir, there is another conclusion to which we wish to draw your attention, and it is this: that even the method of the export licensing system does not allow the full story to be told of British armament firms' real participation in equipping other nations for war. What I mean by that is this, that the arms trust's international ramifications are of such a character that what they perhaps could not get across from Britain direct, without mobilising a certain volume of public opinion against it, can be supplied by their subsidiaries in other countries, and the real question of the export of war munitions is thus lost. Secondly, Sir, it has another very important fact so far as we are concerned, and that is this, that it will be within your knowledge that in 1920 London dockers refused to transport munitions to Poland for use against Russia at that time. The evasions that they can get under the present system of export licensing could, in certain political contingencies, allow the arms trusts to supply nations abroad where their subsidiaries are, and avoid the possibility of an embargo being put upon that export as a result of the development of a militant anti-war movement.

Now in regard to Section IV, which is headed "Complicity of the entire Capitalist Class in the Arms Traffic," we direct your attention to the following first stages. The vast armaments trusts, with their capital running into many tens of millions of pounds, are representative of finance capital as a whole, and are closely interlocked with the entire capitalist structure. Their shareholding lists run through the entire body of the governing class, financiers and politicians, lords and ladies, generals—

536. *Chairman:* Do you think you need add to this? I mean, have not you stated in paragraph 10 all that there is to be said about this?

Mr. Pollitt: I believe that I have one or two more facts to bring to your attention.

537. *Chairman:* Very well.

Mr. Pollitt: And in connection with this section we want to make three points and to try to prove them. First, that the shareholders from all sections of the capitalist class benefit from the armaments industry, and not only those directly concerned with particular armament firms. Secondly, that all capitalist enterprises benefit by war activity and war preparation. Thirdly, that although apparently armaments control is widely scattered, bringing certain profits, the real cream goes to the big banks and trusts who control policy; and in substantiation of this we draw your attention to the following. This is an extract—I will not read it all, but we will hand it in—from the *Sunday Times* financial page, May 15, 1935. It is headed "The Outlook", and it goes on to say:—

"But instead of viewing such a prospect with dismay"—this is the increase of the Air Force—"as an unprofitable addition to the national debt, the stock exchange prefers to look upon the bright side, and the public show a keen appetite for the shares of companies likely to receive government orders. Illogical though it may seem, this prospect of heavy expenditure on armaments has given a pronounced stimulus to various industries. . . . What concerns the investor at the moment is that the warlike atmosphere of Europe is providing a

stimulus in many branches of industry. It may even help to explain the re-awakening of interest in oil shares, though the excellent results of the Royal Dutch Shell group provide the more immediate reason for the buying."

Here is, in our opinion, proof of our argument that the whole of capitalistic enterprises benefit when there is a stimulus going on for war preparation.

In regard to our further contention that the entire capitalist class is involved, we wish to draw your attention to the following, particularly in connection with paragraph 10 and paragraph 11. We believe that the complicity of the entire capitalist class is indicated by the fact that all sections of the capitalist industry, not just the arms firms, benefit from war, and that this is confirmed by the nature of those who really control the industry. The control, though not necessarily the ownership, of the leading firms engaged in the production of armaments is monopolised in very few hands, and I have put in this chart* to the Commission—we have other copies available—in which it is clearly shown how that control over the whole of the industries rests very largely—

538. *Chairman:* I think we have a copy of this, or substantially the same as this, already?

Mr. Pollitt: Well, there you see, Sir, how the actual control is in reality in the hands of one or two dominant groups, and very quickly I would like in this connection to indicate one or two actual facts. For example, Armstrong Whitworth Securities Limited, we affirm, is controlled by the Bank of England. We could give further details if that was necessary. Similarly with Vickers Armstrong, extremely important financial interests are found in and about Vickers Armstrong. In addition to the large shareholdings of Vickers, Limited and Armstrong Whitworth Securities are found A. W. Consolidated Stock Trust, Limited, with 1,000,000 "B" Preference Shares of £1 each. This concern is controlled by the banking firm of Baring Brothers. On April 5th, 1934—this is the last available file at Somerset House—the banking house of Glyn Mills owned, either in its own right or as a proxy for Vickers, Limited, its clients, 2,000,000 "B" Preference, 1,500,000 "B" Preference and 5,000,000 Ordinary shares of £1.

In this connection, we would like to direct the attention of the Commission to what we consider a real example of speculation on the profits that a war will bring. It is the transaction carried out by the Sun Insurance Company in connection with Vickers Armstrong. We say that the Sun Insurance Company is closely interested financially in this concern. At its formation, late in 1927, Vickers Armstrong took out an insurance policy with the Sun Insurance Company by which, if profits in any year during the five years ending December 31st, 1932, did not amount to £900,000, a contribution from the Sun Insurance Company would be made not exceeding £200,000. Since profits in the years 1928 to 1932 never got anywhere near £900,000, the Sun Insurance Company handed over £1,000,000 during the five years. The terms for the repayment of this are rather remarkable. The Sun Insurance Company has at first to be repaid by the appropriation of 40 per cent. of profits in excess of £900,000. Second, the sum repaid is limited to the original capital sum lent, plus 6 per cent. Third, if the necessary profits are not made by 1947, the policy lapses, and the Sun Insurance Company loses its £1,000,000. And we do not believe, Sir, that there is any insurance company in the world that puts up £1,000,000 in the hope that it is going to lose it. We believe that the interests of the banking firms with the armaments firms, and the political ramifications which follow it, made the directors of the Sun Insurance Company feel absolutely certain that by 1947 they would more than have got back what they had invested.

* Appendix II.

23 May, 1935.]

Mr. HARRY POLLITT.

[Continued.]

Similarly, in regard to the firm of Cammell Laird. This firm is controlled by the Law Debenture Corporation, which, as trustee of the first and third mortgage debenture stock, holds one majority share in the company, and can outvote all the other 3,829,717 5s. ordinary shares; so that, Sir, if any pacifists or clergymen get their consciences aroused and they go to this meeting to demand a change of policy, the Law Debenture Corporation has this one vote which puts the whole of these little 5s. shares immediately into the background. We believe that this, too, is an aspect which the Commission ought to consider.

Similarly with the firm of Beardmore. This company is likewise controlled by the Law Debenture Corporation. There is a committee of three, nominated by it, which holds ten majority ordinary shares, which confer the right to outvote 1,014,790 shares held by Lord Invernairn and 1,500,000 shares held by his wife. This control remains until the first mortgage and "A" income debenture stocks are paid off. Now, who are behind this ownership of the majority ordinary shares? Basil G. Catterns and another, who are closely allied with the Bank of England, Lloyds Bank, the Glasgow Office of the Royal Bank of Scotland—

539. *Chairman*: Are not you over-elaborating this?

Mr. Pollitt: I have finished. I have only one more.

540. *Chairman*: I am glad to hear it. Very well; finish.

Mr. Pollitt: And the National Bank of Scotland.

Now, in relation to the assertion that we make in the memorandum regarding the connection which exists between the front bench politicians, the upper ranges of the bureaucracy, of the judiciary, of the fighting services, and the trust, we noted that the shares of Sir John Gilmour were brought out at yesterday's sitting, but we believe also that it is worth recording that Mr. Neville Chamberlain, the Chancellor of the Exchequer, holds 833 preference shares and 5,414 ordinary shares in the I.C.I., that, as typical of the aristocracy, Prince Arthur of Connaught has 3,000 5 per cent. preference shares in Vickers; that the Earl of—

541. *Chairman*: You know, this is really wearisome, because you have made your point, have you not?

Mr. Pollitt: But, Sir, we have made it in a more generalised form there. This is particularising. The Earl of Dysart has 40,000 ordinary shares in Vickers. Representing the Church, the Bishop of St. Andrew's has 2,100 ordinary and preference shares in Imperial Chemical Industries. Barrow Cadbury, a leading Quaker—it shows you how far it goes—also owns 30,875 preference shares in I.C.I.—

542. *Chairman*: Really, I think I must intervene. I think you are going further than is really necessary to support your contention. Perhaps you will take a hint.

Mr. Pollitt: If I may conclude on it, I think that in this connection the position of the Recorder of Bristol, and Sir John Eldon Bankes, who holds 1,000 preference and 765 ordinary and 170 deferred shares in Imperial Chemical Industries, is worth noting. I will not go into it, because it is all here, but we can prove on the basis of the documents how the fighting services and how the upper bureaucracy are intimately associated with money invested in firms either directly or closely allied to the production of war.

This table*, Sir—I do not know whether the Commission has seen it—puts in a striking form the loss of profits that has taken place between Christmas, 1934—I hope there is no significance about the date—and May 17, 1935. We have put copies of that chart in in order to show how the whole of the capitalist class in general is benefiting from this.

Then just one or two short quotations to show how the armament firms are interested in defeating any-

thing that tends to the limitation or the reduction of armaments. If we go back for a number of years, which I do not propose to do, we notice that apprehension increases, as the movement for peace tends to get stronger. For example, Sir Herbert Lawrence, the chairman of Vickers, said at the 1927 meeting: "It is no good disguising the fact that we are an armament firm depending on armament orders. If there is to be a further limitation of armaments the future of the armament business of Vickers, like that of every other armament firm in the country, may become difficult." In 1928 he was stressing the point: "Our interests through Vickers Armstrong are mainly in connection with armaments," and then went on: "The proposals for naval disarmament, if successful, will naturally have an adverse effect on the trading results of Vickers Armstrong, should any material reduction result."

543. *Chairman*: Yes; but is not that quite obvious? Is it necessary to call attention to the fact that if the demand for a particular thing that a firm makes decreases, the profits will decrease?

Mr. Pollitt: I respectfully submit to you, Sir, that as a result of what was brought out at the American Inquiry, where it was established that the armament firms had emissaries at Geneva actively campaigning against—

544. *Chairman*: That is another point altogether.

Mr. Pollitt: It may be another point in that respect, but it may also be true that our armament firms do the same thing.

545. *Chairman*: Very well.

Mr. Pollitt: Then in connection with the relationships which exist between the trusts and the defence services—Sir Herbert Lawrence is speaking in 1934: "Our relations with the three defence services continue to be satisfactory, and, though as an armament firm we are the subject of opprobrium in certain quarters, we claim that so long as our products are necessary for the defence of the Empire we are rendering a national service." Sir Robert Hadfield, the chairman of Hadfields, Limited, in 1928 said: "In this changing world it is highly desirable not to relax our efforts. Notwithstanding all the talks about League of Nations and peace propaganda, which are all very well in their way, we should bear in mind the old adage: Keep your powder dry." At this same meeting Sir Robert Hadfield congratulated Mr. Bridgeman, who at that time I believe was connected with the Admiralty, on the stand that he had taken in this connection. One final quotation from Sir Robert Hadfield is the one in 1933, where he told the shareholders: "It is to be hoped that before long there will be better things in store for us." He openly paid a tribute to the friendly relations between himself and the newly-appointed First Sea Lord, Sir Ernie Chatfield, K.C.B., K.C.M.G. This is what Sir Robert Hadfield said: "I now come to the speech recently delivered by the new and very able First Sea Lord. The associations of myself and Major Clark with Admiral Chatfield for a considerable period of time have been unusually cordial, and he has on many occasions smoothed down obstacles in our path. Our country is indeed fortunate in having so able a chief at the head of our senior Service, which forms the backbone of our Empire defence, the British Navy." I think that those few facts are ample confirmation of the conclusions that we have tried to draw.

May I, however, take the liberty, Sir, of directing your attention to the second paragraph of paragraph 11, where we make a certain reference to the *Times*? We believe that this ought to be brought out here in view of the role that the *Times* plays in the national life of this country. You will remember, Sir, that it was raised at the Vickers meeting in 1934, when one of the shareholders asked a question about this. He said: "Mr. Chairman, we have been greatly interested in your assurance that Messrs. Vickers have never

* Appendix III.

23 May, 1935.]

Mr. HARRY POLLITT.

[Continued.]

had any part in the influencing of newspapers, but I should like to ask whether you are aware that several years after the war Mr. Bryce, a nephew of Lord Bryce, was simultaneously the *Times* correspondent in Belgrade and business agent for Messrs. Vickers. He failed to get enough order for Vickers, and his appointment lapsed, and then his appointment with the *Times* lapsed." And I have two or three other quotations to show you where, on various occasions, men who have been sales merchants for armament trusts, that appointment has coincided with the appointment that they have held for the *Times*. Therefore, Sir, we draw your attention to what we say here—the significance of this great newspaper not printing the same reports of Vickers' annual meeting on important questions that subsequently appear in other sections of the Press.

On the section which deals with the responsibility of the present National Government for blocking adequate inquiry into the arms traffic, I do not want to say very much—

546. *Chairman*: I think you had better not; but are you really suggesting paragraph 15 as a matter which we ought seriously to consider: "We consider that the Commission in its report should express the sharpest protest against this restriction of its scope and powers." Do you think it rests with a Royal Commission to complain of the terms after they have accepted the appointment?

Mr. Pollitt: I consider, Sir, that in this grave eve-of-war situation, anything that you can do, despite all the attempts of the Government to limit the scope of this Commission, should be done by you in the interests of humanity as a whole; and we put it forward most seriously and earnestly.

547. *Chairman*: Very well.

Mr. Pollitt: In regard to this question, I only want to substantiate the fourth paragraph in paragraph 13, where we say: "The National Government has sought to block by every means in its power the investigation of the American Arms Inquiry, and has exerted direct diplomatic pressure to prevent important documents being brought before the inquiry."

I only want to put the following two points. In the House of Commons, on 11th February this year, Mr. Dobbie asked the Secretary of State for Foreign Affairs whether any official protests had been made to the United States Government concerning any of the evidence given at the United States Senate Arms Inquiry; if so, when were such protests made; and what was their nature. Sir John Simon replied: "I presume that the hon. Member in referring to official protests is inquiring whether any such protests have been made by His Majesty's Government. On this assumption the answer is: No. The only exception was with reference to a ridiculous story, to which I referred in an earlier debate, which brought in the name of His Majesty the King." And now, Sir, I ask you to listen to this extract from the *Financial Times* of 30th April of this year, which shows a direct contradiction between the statement in the House and the statement made in such an important newspaper as the *Financial Times*.

548. *Chairman*: But, really, you cannot ask us to accept statements in all the newspapers as statements of actual fact, can you? You do not agree with the statements in a great many newspapers, do you?

Mr. Pollitt: I do my best, Sir, to counteract their effect as often as possible; but when it suits our purpose, and I think here to-day, we have to recognise the appropriateness of this particular quotation from the *Financial Times*. It is headed: "The United States Arms Inquiry. Committee to avoid complications":

"The representations made by the British Ambassador against the submission to the Senate Munitions Committee of confidential correspondence between American banking concerns and the British Government has here had effect. Senator Nye, the Chairman of the Committee, announced

to-day that his Committee had agreed, after a conference at the White House with President Roosevelt and Mr. Hull, Secretary of State, to avoid any action likely to raise complications with foreign governments in connection with the investigations into the war-time files of J. P. Morgan & Company. It is understood that the investigators were summoned to the White House as a result of the informal representations made by the British Ambassador yesterday."

We are putting that in as substantiation, from a hostile source, of the allegation contained in our memorandum.

On the section that deals with the "Ineffectiveness of current reform proposals for a state monopoly of the armaments industry as a solution," we only wish to emphasise that in our conclusions we are coming forward with certain proposals which we believe are practicable, and could be operated, if there were a genuine desire to abolish the worst features of the armament trade. It is not necessary, therefore, to go into this section on the ineffectiveness of the current reform proposals; and I will come straight to our conclusions.

What has been the aim, Sir, of our memorandum? We have tried to show, from the point of view of the Communist Party—and we do not necessarily expect the Commission to agree with that point of view—that war is inseparable from capitalism; but also another important thing, and that is that war is not only terrible, but is a terribly profitable thing, and that we do not believe that the problems which are associated with the armaments industry can be abolished until the present system is abolished; but that is outside your terms of reference, and therefore we make certain proposals that have for their objective the exercising of a more effective control over the armaments traffic, and at the same time would help the working class fight against everything associated with the cause of war.

What is it that we propose? We propose the prohibition of private manufacture and sale of armaments and munitions, and we do not do it on the ground that this will be a less evil to the working masses, but that by the prohibition of private manufacture the whole of the trade could be concentrated, the whole of the fight against war could be concentrated against the government, which would then be fully responsible for whatever productivity was taking place in armaments industries. In that connection, we give very great importance to our proposal for full publicity of all state construction of armaments and munitions.

No doubt, Sir, you would read Mr. Baldwin's speech in the House last night, where he said: "If only we knew what was going on behind the scenes!" We are in hearty endorsement of that, and especially if we only knew what went on behind the armament scenes. If every contract had to be tabulated, if we knew exactly what it was for, then the whole of the people who are against war would be in a more effective position to fight it. We are proposing the complete abolition of the export licensing system, and a complete ban on the export of all armaments and munitions.

Finally, we are proposing heavy penalties for any default on the above provisions, and the establishment of elected workers' control committees in the armament factories, and a central workers' control commission, elected from the working class organisations, with full powers of inspection and calling for documents, to check execution of these provisions and issue periodical reports. We believe, Sir, that this trade is so terrible that there are no penalties that are too drastic; and for our part we would welcome a recommendation on the part of the Commission that those who violated the provisions that were finally agreed upon—that there should be no penalty that was too drastic to impose upon that violation.

Now, Sir, I should like to draw your attention—it is a rough analogy, but we find it, I believe, to

23 May, 1935.]

Mr. HARRY POLLITT.

[Continued.]

give an important clue to how this proposal practically could be operated. In the minefields of this country there is a custom for men in a pit to have the right to elect what is called a pit inspector. This system functions better in Fifeshire than in any other part of the British coalfield. The men elect this pit inspector. He then has the task of examining a particular group of mines, going into the whole question of their safety and making recommendations to the management, which must be carried out. After each inspection he must report to the miners in that pit, on what he has found, and what he has proposed. Now, it is only rough, but it is some such principle that we believe, if it was applied to the armaments industry under working-class control—and I make it clear that the control we have in mind is not a control exercised by the trade union leaders associated with the Trade Union Congress, that these workers' control representatives are elected persons actually working in the factories and elected by their mates in the factories, and their election subsequently endorsed by the trade union branches to which they belong, and these committees would naturally have to have the fullest facility for going into the source of every order, for finding out where the order was for, full examination into the books in order that there would be no opportunity of pulling wool over the eyes of this Commission.

These, Sir, in brief, are the points of view of the Communist Party, the proposals that we have to make, and we are sure that they will receive the very serious consideration of this Commission.

I should explain finally that there are just one or two corrections that have to be made in some of the figures in our memorandum, but they do not alter our political argument, and we can hand in those corrections to the Secretary of the Commission at a later stage.

549. *Chairman*: There are only one or two questions I want to ask you, to be quite sure that I understand what it is you are putting forward. I have no questions at all to ask about your suggestions about the prohibition of private manufacture and sale of armaments and munitions; they appear quite plain; but is this a correct summary of the substance of your argument? May I put it to you? First of all, under head VII, paragraph 20, just the last few lines of that paragraph, you say: "The evils of the armaments traffic can only be overcome by the overthrow of capitalism and the establishment of the world socialist society, in which armaments will no longer be necessary and production will be organised for use, not profit." That is your view of the only possible real cure, is it?

(The Witness withdrew.)

Mr. NEIL BARCLAY HUNTER, representing the British Movement against War and Fascism, called and examined.

556. *Chairman*: Mr. Hunter, will you tell me what your position is in reference to this organisation?

Mr. Hunter: I am the honorary secretary.

557. *Chairman*: And have you prepared this statement* yourself?

Mr. Hunter: In conjunction with the executive committee of the organisation.

558. *Chairman*: And I ask you the same question as I asked the last witness: Has it been considered by any representative committee, or is it merely the views of those who prepared it, and who consider that it represents the views of the organisation?

Mr. Hunter: We have circulated it to all our branches and affiliated organisations, which number well over 200, and asked them for comments and so forth. Time has been short, but we have

Mr. Pollitt: Absolutely.

550. *Chairman*: Well, at any rate, I suppose you would agree with me that it is not a cure that is likely to be immediately effective?

Mr. Pollitt: The more's the pity!

551. *Chairman*: In paragraph 17, under head VI, I want to be quite sure that I understand this. At about the last eight lines you say: "Finally, if the State Armaments Monopoly were to take over the business of the export of armaments, this would enormously increase the power of pressure on foreign governments. Thus the establishment of a State Armaments Monopoly would not necessarily in itself mean any step forward to removing the existing evils of the arms traffic, but might mean an intensification of those evils." Now, is it correct to say that in your view, so long as the capitalist system continues, nationalising manufacture and trade in arms is not likely to improve, but on the contrary is likely rather to aggravate existing evils?

Mr. Pollitt: No, our view is put in the memorandum that the traffic as a whole is wrong, that the state control is a lesser evil provided that it is accompanied by the prohibition of any exports of armaments and by workers' control commissions as compared to the armaments industry being vested in private ownership like Vickers.

552. *Chairman*: Very well. Now that explains that. Then under head III, in the last paragraph under the heading you say: "Thus direct responsibility for every operation of the nominally 'private' British arms traffic rests with the British Government." In your opinion, is it the fact that really the responsibility for what is going on now, in reference to the manufacture and export of arms in this country, rests with the Government rather than with the private firms?

Mr. Pollitt: Rests with the Government, which alone has the power to give the export licences; and the armament manufacturers, in their various speeches, make reference to that fact.

553. *Chairman*: Very well. I think that is all I have to ask you. Does anybody wish to ask any question?

554. *Dame Rachel Crowley*: I have listened with great interest to Mr. Pollitt's memorandum, and the way in which he has presented his case. I do not think I have any questions to ask, because I am still very much sunk in the memorandum itself, which I hope to read again carefully in the light of what Mr. Pollitt has said to-day.

555. *Chairman*: Are there any further questions? Thank you, Mr. Pollitt.

not received any expressions of dissociation from the views set forward there, and we have confidence that, on the whole, they represent the views which the organisation as a whole—it is a very loose one—would like to put before the Commission.

559. *Chairman*: Would you like to read it?

Mr. Hunter: As the Commission already have it, perhaps, if the Commission's time is short, there is no necessity for me to read it again, particularly as a great deal of it has already been covered by submissions of other organisations in the past, such as Mr. Arnold-Forster's statement yesterday, which, of course, went into much more detail in trying to substantiate some of the points on which we base our case; but in connection with the first point that we make, that there is at the present moment such a great loss of life going on in the world, we feel that the body of opinion that we represent regards this as perhaps one of the most vital factors

23 May, 1935.]

Mr. NEIL BARCLAY HUNTER.

[Continued.]

to be taken into consideration, that there is so much slaughter actually going on at the present moment. In connection with that, if I may just read a few lines from an article which appeared in the *Times* on the 21st May, only a day or two ago, I think it might be helpful to the Commission in realising what the position is to-day. It says:

"The Bolivian Indian cannot be expected to have his country's cause at heart, and he is no match for the Paraguayan soldier in courage and endurance. The Bolivian army has undergone great sufferings. It has generally numbered about 80,000 men, but it is a constantly changing 80,000. Some 50,000 have died since the beginning of the war, and over 20,000 Bolivians are now prisoners in Asuncion. The reasons for these enormous losses, which are proportionately more severe than any encountered by armies in the Great War, are not due to any new inventions or improvements in mechanised or chemical warfare, for the Chaco war is essentially a war of infantry, acting in most cases without support from tanks, artillery, or aircraft. But disease claims at least as many victims as enemy bullets, while a sinister insight into the nature of the war is the small number of wounded compared with killed. Medical arrangements are primitive, transport is difficult, and wounded are easily lost in the thick forests."

Well, Sir, much evidence has already been produced to the Commission indicating that the British armament firms are very much concerned in this war, and we feel that we should also especially emphasise the fact of the terrible nature of the war that is going on there, and, of course, other wars in other parts of the world at the present time.

But I was going to ask, Sir, if you would consent to my explaining very briefly why it is that in contrast to the National Peace Council and other organisations which have recommended control rather than prohibition, we feel that the circumstances of the case now suggest, first of all, that prohibition of the private manufacture of and trade in arms is necessary, and, secondly, that there is no inherent difficulty in bringing it about. May I elaborate that point, as being the one to which we attach special importance?

560. *Chairman:* Yes.

Mr. Hunter: Well, Sir, our movement came into existence as a result of the events in 1931 and 1932 in the Far East, the invasion of Manchuria by Japan and the attack on Shanghai in the next spring, when it was felt that the evidence was unmistakable that the world was entering into a new period in history, when the question of peace and war was a matter of very great urgency. We felt that we were very much concerned to see to it that we have full liberty, in this country, to put forward our view that, if war cannot be prevented, then sooner or later this country, like other countries, is threatened with what really amounts to a form of race suicide.

This view that war is a form of race suicide is, of course, as we know, in this country very generally accepted—still not universally accepted, perhaps, but very generally accepted. But we are very well aware that that is not so in other countries, and that what I might call the opposing view, which was perhaps expressed most succinctly by Signor Mussolini in a short phrase, that "perpetual peace negatives the fundamental virtues of mankind, which are revealed only on the bloodstained battlefield in the full light of the sun"—that opposed point of view is, in many parts of Europe at present, one which cannot be controverted; there is no legal possibility of controverting it. We think the Commission should, if they can, consider the position that we now have in Germany, another country which has had to deal with the question of the existence of a large private trade in armaments such as we have in this country, where to-day we have the position that such a point of

view as I am expressing to the Commission now and represent, is not allowed to be put forward at all.

We find that that position coincides with the existence of a form of government in which you have a supreme economic council, I believe composed of nine members, of whom one represents the great potash industry. The exact connection of the potash industry with war production I am not absolutely clear on, but I am told that it is a fairly considerable one. But more important, perhaps, another member of the supreme economic council, Dr. Karl Bosch, is a director of the German Dye Trust, and we would like to draw the Commission's attention to the fact that this, in a sense, is the parallel organisation in Germany to Imperial Chemical Industries, to which so many references have been made before the Commission; and, further, that a third member of this small junta which controls the complete economic life of the country, and therefore, we may assume, to a very large extent the political life too, is the head of the great armaments firm of Krupp—Herr Krupp von Bohlen.

Therefore, we feel that if it is the case that in this country there are already very powerful armaments interests, and if it is the case that the armament industry is growing, that more of the total business transacted in the country is going the way of the armament firms—and I hope the Commission will not require any further evidence that that is the fact after what has already been said—then we feel it must be concerned to see whether, in this country, unless something can be done to check the economic and political influence which can be exercised by armament firms, we may not eventually find ourselves in the same position that the German people find themselves to-day.

Now, why we feel that the control of armaments may not be sufficient to preclude this happening is, once again, because we have seen what has happened in Germany, where, since the war, there was, owing to the Versailles Treaty, the most complete and absolute control of the private manufacture of armaments that, I suppose, it would be possible to conceive; and yet we are faced by the fact that, after a number of years of such control, you still have the position where, in the end, it is not the public who control the armament firms but the armament firms which, as we would like to submit, are now controlling the public. We therefore feel that the Commission—if it is satisfied that the armament firms in this country are already, to-day, in a position where they are able to exercise very considerable influence on the course of public affairs, and can be expected, owing to the present course of international affairs, to increase that influence, because the foundations of the influence of their increased business would give them still more power—would like to go very thoroughly into the question whether it is not possible, if public opinion really realises the facts, to recommend that Parliament should pass an Act of Parliament completely prohibiting the private manufacture of and trade in arms.

We realise, of course, that this is no simple matter, and that it is quite conceivable that a single Act of Parliament would not at one fell swoop shut up every possible loophole of any British national engaging in the armaments traffic, but we feel that that is not in itself a final answer to our case, because when it has been a question of prohibiting other undesirable forms of traffic in the past the same considerations have applied. There was the case of the abolition, in which we are always glad to think this country took, if not the initiative, a very early initiative, of the trade in slaves. We know that that was not complete, that still to-day in many parts of the British Empire slavery still continues, but nevertheless we feel that the first Act of Parliament that was passed at the end of the 18th century did strike an enormous blow at what had then come to be regarded as an infamous traffic; and we feel, therefore, that it would not be beyond the capacity of the Commission to make a recommendation as to

23 May, 1935.]

Mr. NEIL BARCLAY HUNTER.

[Continued.]

the possible character of legislation which would very considerably curb the power of armament firms in this country to increase the degree to which they influence public opinion in this country in the direction of increasing the production and sale of the weapons of destruction.

I think, Sir, that that is the principal point we would like to bring forward, because we do feel that previous witnesses have already very fully gone into the available facts on which the arguments we bring forward have been raised.

561. *Chairman*: Then I only want to ask you one question, and that is this. You eventually declare under head E in your summary that your organisation declare themselves in favour of prohibition by law of the private manufacture of and trade in arms. Now the only question I want to ask you is this—whether, before arriving at that decision, you have considered what the effect of prohibition of private manufacture might be if governments themselves became traders in arms—whether the dangers and difficulties and objections to governments trading in arms would not be even greater than the similar dangers and difficulties and objections of private traders trading in arms. That case was put before us yesterday.

Mr. Hunter: Yes. I think that we would have a fairly clear answer to that line of argument were it put forward.

562. *Chairman*: I only asked you whether your organisation had considered it?

Mr. Hunter: Yes, I think I can say that we have. What we would submit in that connection is that if public opinion in this country is sufficiently strong to insist, in its own interests, that private trade in armaments manufacture should cease, it is hardly likely that the same public opinion would consent to allow its Government—and, after all, this is a democratic country—

563. *Chairman*: Oh, but I am not speaking of our Government merely; I am speaking of universal prohibition, not a mere prohibition in our country. Oh, no, I was not thinking of that; I do not think anybody was thinking of that; they were thinking, assuming that prohibition was practically universally accepted, then the alternative would be that there would be only governments left to supply armaments, and it is not a question of what our government would do, but of what other governments might do?

Mr. Hunter: Yes. There, of course, we have no answer to that. If the people of another country are unable to persuade their government to prohibit private manufacture, naturally we have no guarantee whatever that they would be able to prohibit their government from public manufacture and trade. We would not contend that, but we feel that as regards this country there is a case for the prohibition by law of the arms traffic, irrespective of what is happening in other countries, and I think in our original memorandum—perhaps it is not in this one that you now have before you, but in the original one that we submitted to the Commission—we did make the point that our recommendation was for unilateral action on the part of this country in this connection, irrespective of what happened in other countries. We had in mind, of course, the position in Germany at the present time, where, as I pointed

(The Witness withdrew.)

Chairman: I think that finishes the evidence for to-day.

There will be no more evidence called to-day, and we shall not sit to-morrow, because there is no evidence available for us to deal with; but I should like to make a short statement before we rise with reference to the procedure we have followed hitherto, and it is this. We have now concluded the hearing of several of the organisations which up to the present have applied to be heard. The course of procedure adopted has been that on receipt of the application to be heard the organisation has been informed that a full statement of what they wish

out, the armaments manufacturers are in a very much more privileged and powerful position than they are in this country, and we feel that if any action taken by this country were to be contingent on action being taken in all other countries, or at any rate in the principal trade rivals of this country, then it would probably be a question that would be postponed *sine die*.

564. *Chairman*: Yes; but that prompts me to ask another question, and that is this. One quite understands the argument in favour of acting unilaterally from the moral point of view; one quite follows that; but from a peace point of view do you think that it would have any effect, any one single country adopting the attitude you propose? That point was put before us yesterday, too.

Mr. Hunter: Yes, I think it does have a very big effect, because all new modes of thought have to start somewhere, and I would go back to the analogy of the slave trade, where Denmark, I believe, was the first country to prohibit the slave trade, and Britain came in very early; but this prohibition by these countries did not lead to all the business being snuffed up by their trade rivals, but actually and historically to the final abolition of the traffic.

565. *Professor Gutteridge*: But was not that due to the work of the British Navy? It was the British Navy that stopped it, you know. I think you must give the British Navy credit for that. If the British Navy had not been supreme at that time the slave trade would have gone on.

Mr. Hunter: Well, Sir, that perhaps would not invalidate my argument.

566. *Professor Gutteridge*: No, no; but still—

Mr. Hunter: I do not know whether that is so or not.

567. *Dame Rachel Crowdy*: *Mr. Hunter*, I am specially interested in paragraph E in your memorandum, the re-armament of Germany. Your document is headed "Statement of evidence to be tendered by the British Movement against War and Fascism," and in your first paragraph of E you say: "There are indications that British firms have taken a considerable part in this re-armament, though not necessarily in contravention of the strict letter of the Treaty." Of course, that is very important. Can you give us any more indications than those you have given us in your memorandum, excluding the air service, which we understand is under a different system of control? Can you tell us anything more than what you put here—I mean, for example, of exports of arms, export of machine guns, export of anything of the kind from British firms?

Mr. Hunter: No, we have no reason to suppose that there is an export to Germany in this period of any article that clearly can only have a war use, other than this appearance—which we submit is still somewhat unexplained—of an advertisement of the tank in Germany; but we had rather in mind—because we say "not necessarily in contravention of the strict letter"—the sort of transactions which the previous witness drew attention to, large transactions in nickel and the various other raw materials.

568. *Dame Rachel Crowdy*: I see. Then you cannot help us any further in that?

Mr. Hunter: I am afraid not.

569. *Chairman*: Thank you. We are obliged to you.

to submit to the Commission must be supplied. We have allowed these statements to be read in full at our sittings in public, not because we considered all the statements contained in them to be relevant to our inquiry, but because we considered it preferable to allow the organisations to express their views in their own way, rather than to attempt to edit the statements or to shut out anything contained in them. Whether we shall continue that procedure in the future depends upon circumstances, but I desire to offer this explanation of the procedure as far as we have gone.

(Adjourned.)

APPENDIX I.

MEMORANDUM SUBMITTED ON BEHALF OF THE COMMUNIST PARTY OF GREAT BRITAIN

1. We wish to submit evidence to substantiate the following points:—

(I) The role of the United Kingdom as the largest world exporter of armaments, and therefore as the main pillar of the world arms traffic, the evils of which have been universally condemned.

(II) The role of this export of armaments in fomenting war all over the world and assisting the oppression of colonial peoples and working masses.

(III) The direct responsibility of the Government for the operations of the arms traffic and its close inter-connection with the private armaments trusts.

(IV) The complicity of the entire capitalist class in this system of fomenting armaments and war and in drawing profits therefrom.

(V) The responsibility of the present National Government in shielding the armaments firms, blocking adequate inquiry and limiting the terms of reference and powers of this Commission.

(VI) The inefficiency of the proposals for reform put forward, which seek to strengthen the state control of the production and export of armaments, while leaving the export of armaments untouched.

(VII) Immediate proposals.

I.—THE ROLE OF THE UNITED KINGDOM AS THE MAIN WORLD EXPORTER OF ARMAMENTS.

2. The United Kingdom is the main centre of the world's armaments trade. One-third of the world's armaments exports is estimated to come from the United Kingdom. The League of Nations Statistical Yearbook of the Trade in Arms and Munitions, 1934, calculates the following percentages of the world total of armaments exports from the main exporting countries:—

	PERCENTAGE OF WORLD EXPORTS OF ARMS.				
	1928	1929	1930	1931	1932
Great Britain	33.7	33.6	30.5	37.8	29.9
U.S.A....	18.1	16.6	11.6	11.0	8.7
France	14.7	14.5	12.8	7.7	27.7
Sweden	4.6	4.6	7.6	10.5	11.0
Czecho-Slovakia	3.6	4.9	9.4	11.1	4.2

Against a considerable fluctuation of the other countries British predominance remains constant at an average of one-third of the total. The heaviest responsibility for the evils of the world arms traffic thus rests with Britain.

We do not propose to dwell on the processes of corruption of foreign government officials,—

"The majority of foreign government officials are so badly paid that it would be impossible for them to live on their salaries; it is an understated thing that they should receive tips."

(Captain J. H. Ball, Managing Director of the Sole Armaments Company, interview to the "Manchester Guardian," 12th September, 1934);

the direct use of British diplomatic machinery to secure contracts,—

"Our diplomatic help is given only when a foreign State has announced its intention to purchase from abroad; then our service naturally does its best to secure that the British firms should get a proper opportunity."

(Sir John Simon in the House of Commons, 8th November, 1934);

or the direct interest in foreign wars (e.g., in China, or the Bolivia-Paraguay war), by which this trade is maintained. These evils have been widely exposed, and the evidence is familiar.

II.—DESTINATION OF BRITISH ARMAMENTS EXPORTS FOR THE FURTHERANCE OF WARS AND COUNTER-REVOLUTION.

3. The destination of British armaments exports is no less important than the very high total. It is worth noting that the main proportion goes to foreign countries and not to British countries.

BRITISH EXPORTS OF ARMS AND AMMUNITION (£000).

	1928	1929	1930	1931	1932	1933
To foreign countries	1928	2308	1737	1803	1826	2114
To British countries	2180	2080	1763	1144	1063	1365

The years 1930-1933, the years of rising wars in foreign countries (Japan-China, South America), have seen a rapid rise in the proportion of British exports of arms to foreign countries. These wars have brought rising profits to British armament firms.

4. Certain salient directions may be noted:—

(i) JAPAN.—The rise in British armaments exports to Japan in the years 1929 to 1932 reveals the following picture (£000):—

	1929	1930	1931	1932
	98.2	173.7	216.0	230.6

In the years 1931-1932 Japan carried through its aggressive war against China for the conquest of Manchuria and the bombardment of Shanghai. This aggression was condemned by the League of Nations with the British Government participating, and led to the withdrawal of Japan from the League of Nations. The United States further protested at the violation of the Washington Nine-Power Treaty. At the same time as the League of Nations was vainly endeavouring to check this flagrant violation of treaties and aggressive war of conquest, British armament manufacturers were supplying the means for it to be carried out.

(ii) CHINA.—British arms exports to China, according to the very incomplete official returns, show the following picture from 1930 to 1933 (£000):—

	1930	1931	1932	1933
	16.7	24.6	7.3	223.5

During the critical years of Japanese aggression on China the main British support went to Japan. 1933 saw the concentration of Chiang Kai Shek's counter-revolutionary war against the Chinese Soviet Republic. British arms exports to China showed a steep rise; arms were poured in to support this counter-revolutionary war.

(iii) SOUTH AMERICA.—Figures of exports of armaments to South American countries are not available for 1934. It is only possible to call attention to the export of arms and munitions to Bolivia in 1933, which totalled £331,700, as compared with £26,500 in 1931 and £27,200 in 1932; and 15,850,000 cartridges in Paraguay in 1933.

(iv) POLAND.—The rise in British armaments exports to Poland during the years 1929-1933 is shown in the following return (£000):—

	1929	1930	1931	1932	1933
	3.4	9.2	13.4	82.1	118.2

This steep rise is of menacing significance in the present diplomatic situation. Germany, Poland and Japan are the three pillars of the developing anti-Soviet combination which is threatening aggressive war on the Soviet Union (German-Polish refusal of the Eastern Guarantee Pact, German-Polish Military Treaty, semi-official schemes for the conquest of the Ukraine). Britain is actively arming Poland and Germany, as well as Japan, in preparation for such counter-revolutionary war on the Soviet Union.

(v) GERMANY.—The figures of British arms exports to Germany are not available; but the active British participation in the re-arming of Germany, contrary to Versailles, is common knowledge, and was illustrated by the appearance of a Vickers advertisement of tanks in a German military organ (the subsequent "explanation" by the Chairman of Vickers that the advertisement was published in this organ in order to reach the South American public lacks even plausibility, since the circulation of this organ outside Germany is minute, and the natural choice for South American advertising would have fallen, if not on a South American, then on a Spanish journal). At the annual meeting of Vickers, Ltd., in March, 1934, the Chairman, Sir Herbert Lawrence, on being asked for an assurance that the firm was not engaged in re-arming Germany, replied:

"I cannot give you an assurance in definite terms, but I can tell you that nothing is being done without complete sanction and approval of our own Government."

This direct complicity of the British Government only makes the case more flagrant. The sharp rise in British exports of war raw materials to Germany is also striking:

British Exports to Germany (£000)	1932	1933	1934
Nickel, unwrought	...	182	341
Cotton Waste	...	152	87

5. Of especial significance is the export of arms to the colonial countries. For example the figures of British exports of arms and ammunition to Portuguese East Africa may be taken (£000):

1930	1931	1932
29.6	24.7	71.4

These arms are exported only to the Government, not to the colonial peoples, who are cut off by the imperialist powers from access to arms for the defence of their independence against alien rule. Thus these exports of arms are solely for the purposes of colonial oppression.

6. Of similar significance is the export of armaments to countries engaged in active counter-revolutionary suppression of the workers' struggle, e.g., Spain. Exports of arms from Britain to Spain show the following values (£000):

1928	1929	1930	1931	1932
9	803	439	215	525

Guns, howitzers and mortars were exported from Britain to Spain to a total of 27,855 cwt., between 1928 and 1933, and gun mountings to a total of 72,262 cwt. These arms, manufactured by British workers, were destined to be used against the Spanish workers.

III. BRITISH GOVERNMENT COMPLICITY IN THE OPERATIONS OF THE ARMAMENTS TRUSTS.

7. The distinction between the "private" armaments trusts and the Government and state apparatus is a formal one. The trusts are "private" in so far as the profits of the war-trading are appropriated by the capitalist class in their individual capacity as shareholders. But their operations are conducted in complete collaboration with the Government and state apparatus, with which they are closely interlocked. The operations of the armaments trusts are the operations of British Imperialism as a whole, and are the direct responsibility of the British State.

8. This close interlocking of the armaments trusts and the State is most clearly visible in personnel. Thus the Board of Directors of Vickers-Armstrong in 1932 included three Generals, a Commander and a Colonel, and comprised as leading members (1), as Chairman, the former Chief of Staff of the British Army Headquarters in France, (2) a former Departmental Chief of the Ministry of Munitions, (3) a former Master-General of the Ordnance and member of the Army Council, (4) a former Director of Raw Materials Finance at the War Office and Ministry of Munitions, (5) a former Member of the Ordnance Committee, etc.

Imperial Chemical Industries, Ltd., with its £70,000,000 capital, was developed out of the directly government-subsidised British Dyestuffs Corporation, and contains in its Articles of Association that "the company is to keep in touch with His Majesty's Government in all matters of technical information and research, in such manner as the President of the Board of Trade may direct." The great armaments trusts, like Vickers and I.C.I., are in effect great departments of state, like of the Bank of England, but removed from Parliamentary control, and working, on a basis of state support, for private profits.

9. The system of export licences for the arms trade further demonstrates the close collaboration between the state and the armaments trusts. Licences are granted by the Board of Trade or Home Office guided by the advice of the Foreign Office and Service Departments. These departments are always consulted and refusal to grant licences is sometimes taken on their advice. Seven such refusals were given between 1930 and 1934 (Hansard, 9th May, 1934).

The fact that only seven refusals arose between 1930 and 1934 shows that the export licence system is not a system for restricting the arms traffic, but solely for guiding it in accordance with the major strategic and diplomatic interests of imperialist policy. Through this weapon British Imperialism is able to hold a heavy hand over the smaller states, and at the same time to prevent arms reaching oppressed peoples struggling for their freedom ("We give no licence except for export to Governments, a thing which is worth noting"—Sir John Simon, in the House of Commons, 8th November, 1934).

The close connection of state policy and the armaments traffic is similarly testified in the letter of Captain John Ball, Managing Director of the Solely Armaments Company, produced at the American Arms Inquiry:—

"As we are to a very great extent controlled by the varying policy of the Government, it is rather difficult for us to enter into firm and fast agreements with any other armament firms. Stocks we control are of such magnitude that the sale of a big block of them could alter the political balance of power of the smaller states, involving corresponding complications from the point of view of finance and industry. You will, we are sure, fully appreciate that under these conditions we have to submit to a fairly strict control by the authorities concerned."

A further statement of the same Captain Ball in an interview to the press may be quoted:—

"The same restrictions apply to Vickers, and if all the money in the world is on the table, business cannot be done if it is against the policy of the British Government."

Thus direct responsibility for every operation of the nominally "private" British arms traffic rests with the British Government.

IV. COMPLICITY OF THE ENTIRE CAPITALIST CLASS IN THE ARMS TRAFFIC.

10. Not only is the distinction commonly drawn between the private armaments manufacturers and the state or Government thus in practice invalid, but the distinction also commonly drawn between the

private armaments manufacturers, drawing profit from war and the manufacture and sale of the weapons of destruction, and the main body of the capital-owning class is equally invalid. The vast armaments trusts, with their capital running into many tens of millions of pounds, are representative of finance-capital as a whole, and are closely interlocked with the entire capitalist structure. Their shareholding lists run through the entire body of the governing class, financiers and politicians, lords and ladies, generals and admirals, bishops and clergymen, etc. All draw their profits from the trade in death, and these profits run into many millions of pounds per year. Further, these profits have rapidly risen in these recent years of increasing war-tension. Thus the profits of Imperial Chemical Industries have nearly doubled during the past four years, showing the following increase:—

1931	1932	1933	1934
£3,408,290	£4,729,072	£6,001,605	£6,349,107

Similarly the profits of Vickers Ltd. have risen from £816,362 in 1933, to £970,352 in 1934, and those of its subsidiary, Vickers Armstrong Ltd., have risen from £491,952 in 1933 to £724,541 in 1934, an increase of 47 per cent. in one year. In view of the character of the shareholding lists of these firms (both the open shareholders and the concealed shareholders through nominee holdings), it may correctly be said that the rising war tension has brought rapidly rising profits into the pockets of all the most influential members of the ruling class.

To these vast direct profits of the armaments trusts, with all the ramifications of their beneficiaries, must be added the additional profits of the firms indirectly supplying war industries running through the widest range of industry, and benefiting from the extension of the war trade.

11. Thus not only the immediate directors of the armaments firms, nor even only the leading financiers in every branch, but in practice all the leading representatives of the present ruling social order in all spheres, the front bench politicians, the upper ranges of the bureaucracy, of the judiciary, of the fighting services, of the press, of the church, etc., are peculiarly interested in the maintenance and extension of the arms traffic and draw rising profits from its extending operations. Under these conditions it is not surprising that any attack upon the arms traffic meets in practice with united resistance from the existing social order. This was illustrated in the hostile reception in British governing circles to the revelations of the American Arms Inquiry and the universal endeavour to minimise the significance of these very serious revelations.

As an example of the close inter-relations between the armaments trusts and the other ruling social forces it may be recommended that the Commission should make a close investigation into the relations between the *Times* newspaper and Vickers Ltd., the reasons for the identity in a succession of instances of *Times* foreign correspondents and Vickers agents, and the reasons why the *Times*, which purports to be a newspaper, should have suppressed entirely the important interchanges between shareholders and directors at the recent annual meeting of Vickers Ltd., reporting only the directors' reply, but not the serious allegations laid, which were only fully reported in the newspapers of the left.

12. The indictment of the evils of the arms traffic is thus necessarily an indictment of the capitalist class as a whole and of the present social order. The fight against the arms traffic can in consequence only be fought, not as a battle of the existing social order against a small section of evil doers, but as a battle of the working class against the entire capitalist class.

V. RESPONSIBILITY OF THE PRESENT NATIONAL GOVERNMENT FOR BLOCKING ADEQUATE INQUIRY INTO THE ARMS TRAFFIC.

13. The unity of the existing ruling forces in defence of the arms traffic, even while professing to deplore its evils, is most sharply expressed in the role of the National Government in this connection.

British Imperialism has consistently opposed the Soviet proposals for total disarmament, for disarmament by stages, or for the reduction of armaments.

The National Government has led the opposition at Geneva to the American proposal for the international inspection of the arms traffic.

The National Government has sought to block by every means in its power the investigations of the American Arms Inquiry, and has exerted direct diplomatic pressure to prevent important documents being brought before the inquiry.

The National Government has steadily resisted the rising demand for a corresponding inquiry in this country with equal scope and powers to the American Inquiry. This attitude has made it possible for the British financial press to call attention to the superior character of British armament shares from the point of view of the investor on the grounds that there can be no danger in Britain of confidential correspondence of the armament firms being brought into the public eye:—

"Any fears which have been aroused among holders of armament shares that revelations thus far made before the United States Senate would lead to a drastic revision of the activities of British Armament firms appear to have been baseless. Foreign customers placing orders will feel assured that here at least their orders will be executed in strict accordance with the law, and that there will be no danger that their confidential correspondence will be broadcast."

(*Financial News*, 12th September, 1934.)

14. The appointment of the present Commission of Inquiry into the Arms Traffic, in belated response to the increasing pressure and demand, has fully confirmed this prediction of the British financial press. The scope and powers of the British Arms Commission are severely limited, in sharp contrast to the American.

The American Munitions Investigation Committee of the Senate was established

"to investigate the activities of individual firms, associations and of corporations and all other agencies in the United States engaged in the manufacture, sale, distribution, import or export of arms, munitions, or other implements of war; the methods used in promoting or affecting the sale of arms, munitions or other implements of war; the quantities of arms, munitions or other implements of war imported into the United States, and the countries of origin thereof, and the quantities exported from the United States, and the countries of destination thereof."

as well as to review existing legislation and the question of a Government monopoly, and to make recommendations. It had further powers to subpoena witnesses, compel the production of all documents and papers, and was provided with adequate finance to have a staff for independent inspection and discovery of the facts, instead of having to accept the prepared evidence of the interested parties.

The same information is of the highest importance in relation to the British armaments trusts, and the existing information is inadequate in the extreme. Yet the British Commission is specifically limited in its terms of reference to consider only recommendations of legislation, without any instruction to find out the facts; and it has no corresponding powers to secure evidence. According to answers to parliamentary questions, it appears that even the vitally important evidence brought before

the American Commission, affecting British firms, is not to be placed before the British Commission. It is obvious, in view of the facts already known as to the character of the operations of the armaments trusts, that the prepared statements and evidence of the armaments trusts on their own behalf cannot be accepted by any unbiased inquirer as adequate.

15. We consider that the Commission in its report should express the sharpest protest against this restriction of its scope and powers, which is equivalent to a shielding of the armaments trusts and of the arms traffic from investigation.

VI. INEFFECTIVENESS OF CURRENT REFORM PROPOSALS FOR A STATE MONOPOLY OF THE ARMAMENTS INDUSTRY AS A SOLUTION.

16. The terms of reference of the Commission put forward for consideration three lines of legislative proposals:—

(i) State Monopoly of the armaments industry, whether by the United Kingdom alone, or by all countries;

(ii) Alternatively, measures to remove or minimise the evils of private manufacture;

(iii) Revision of the existing regulations for the control of the export trade in armaments.

We consider that these proposals, even while under certain conditions they may be utilised to assist the fight against the arms traffic, cannot be regarded as a solution of the evils of the arms traffic.

17. It is clear from the analysis already made of the existing close relations and collaboration of the state and the armaments trusts, that a re-organisation of the armaments trusts as a monopolist state trust could not constitute a basic change. The unified state trust would be able to organise the production of armaments more efficiently and more economically than is possible under the conditions of private industry, as was abundantly illustrated by the experience of the state factories during the war. This would constitute a measure of rationalisation, and would enable the state to secure a larger volume of armaments for the same expenditure, or alternatively to devote a larger sum of money to other forms of war expenditure. But it would not mean an elimination of the profits factor, if nationalisation were to be conducted on the basis of compensation. If the existing armaments trusts were to be nationalised on the same basis as the London Traffic Trust has been taken over, by the substitution of new stock on very generous terms to the shareholders for their existing stock, it would mean that the production of armaments would continue to be yielding many millions of pounds a year to the private stockholders, with the addition of a state guarantee for this income. Under these conditions the transformation to a state monopoly might prove a very profitable transaction to the armaments money-makers. It is likely, however, to be resisted by these so long as the speculative possibilities of very high profits through war outweigh the advantages of the guaranteed state income. If, further, the State Armaments Board were to be constituted on the same lines as the London Transport Board, independent of control by parliament, it would mean that the operations of the armaments industry would in practice continue as secret and uncontrolled as ever, but with a mantle of open state sanction and approval. Finally, if the State Armaments Monopoly were to take over the business of the export of armaments, this would enormously increase the power of pressure on foreign governments. Thus the establishment of a State Armaments Monopoly would not necessarily in itself mean any step forward to removing the existing evils of the arms traffic, but might mean an intensification of those evils. The countervailing considerations in view of which we nevertheless advocate the prohibition of

the private manufacture of armaments will be given in the next section.

18. The same considerations which apply to a State Monopoly of armaments production and sale apply in still stronger measure to any half-way proposal of state control of continued private production and sale of armaments.

19. No revision of the existing system of export licences for the export of armaments can remove the basic evils of the export of armaments. The only measure which should be taken is the complete prohibition of the export of armaments.

VII. CONCLUSIONS AND IMMEDIATE RECOMMENDATIONS.

20. The Communist Party holds the view that the evil of armaments, and the therefrom arising and consequential evils of the armaments traffic or drawing of profits from the manufacture and sale of the instruments of death and destruction, are the inevitable consequence of the existing social order, based on class-exploitation, on the imperialist subjection of the colonial peoples, and on imperialist conflict for the division of the world. The evils of the armaments traffic, which the present Commission has been appointed to consider how to minimise, cannot be isolated from the question of armaments as a whole.

The unanimous refusal, by all the imperialist powers, of the Soviet Union proposals for total disarmament, proves that the maintenance of armaments is indispensable to imperialism. But if armaments are thus indispensable to capitalist society, it necessarily follows that within capitalist society armaments, like any other commodity, can only be produced capitalistically, i.e., within and as an integral part of the profit-making structure. Hence arises the dilemma that, while human feeling revolts against the conception of drawing profits from producing and selling the instruments of death and destruction, the economic-political necessities of the existing order compel it; and in the end the consciences of all the most highly respectable and moralising members of the present ruling class, including the bishops or official representatives of the Sermon on the Mount, find no difficulty in reconciling themselves to this necessity. The task of the Commission, to find means to overcome the evils of the armaments traffic, while maintaining the production of armaments within capitalist conditions and leaving its roots in the existing capitalist order untouched, is in fact a contradiction in terms and can admit of no final solution. The evils of the armaments traffic can only be overcome by the overthrow of capitalism and the establishment of the world socialist society, in which armaments will no longer be necessary and production will be organised for use, not profit.

21. At the same time the Communist Party puts forward the following immediate recommendations, not as means to achieve the impossible task of overcoming the evils of the armaments traffic within capitalism, but as means to assist the fight of the working masses against the armaments traffic and those responsible for it:

(i) PROHIBITION OF THE PRIVATE MANUFACTURE AND SALE OF ARMAMENTS AND MUNITIONS.

We advocate this, not on the ground that a state armaments monopoly would be less of an evil to the working masses, but on the grounds that the existing complete secrecy of operations of the private armaments trusts and the concealment of government responsibility places heavy obstacles in the way of the effective fight against armaments, and the establishment of direct government responsibility for every piece of armaments construction in the country would assist to strengthen this fight. As a necessary corollary of this we advocate:

(ii) FULL PUBLICITY OF ALL STATE CONSTRUCTION OF ARMAMENTS AND MUNITIONS.

Such publicity, if effectively enforced, would place a powerful weapon in the hands of the fight against armaments.

(iii) ABOLITION OF THE EXPORT LICENSING SYSTEM AND COMPLETE BAN ON THE EXPORT OF ALL ARMAMENTS AND MUNITIONS.

Two arguments are commonly put forward for the maintenance of the export of armaments. The first is that this export ensures the existence of a larger armaments-producing plant in Britain, which is immediately available for use by the Government in case of war emergency. The second is that any ban would be damaging to the interests of the smaller countries, which have not equal facilities for the production of armaments.

Both arguments lead in fact to the opposite conclusion.

The limitation of armaments-producing plant, and lack of facilities for rapid extension in the event of war, would lead the British Government to hesitate the more before going to war, whereas the existence of large facilities is an encouraging factor to war.

The imperialist export of armaments to the small countries is not made in the interests of the smaller countries, but in the interests of imperialism, which already regulates this export according to its diplomatic and strategic policy. Through this export of armaments, and the loans and credits commonly associated therewith, imperialism imposes on the smaller countries a crippling burden of armaments which, on their own resources, they would never have attempted to maintain, drags them into entangling war alliances and makes them virtual vassal states, drives them into war against their own interests, and, where war between small states has broken out, enormously prolongs the war (as in the case of the Bolivia-Paraguay war) when the countries, if left to their own

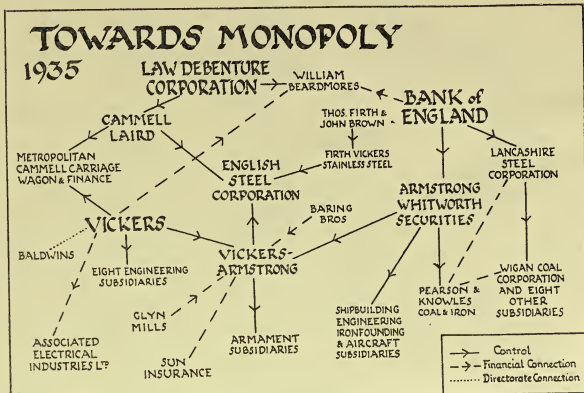

limited resources, would have been compelled speedily to bring it to an end. The role of the export of armaments in maintaining civil war and counter-revolutionary governments, as in China, is notorious. The export of armaments for maintaining war and terrorism throughout the world; and its complete prohibition is imperative.

(iv) HEAVY PENALTIES FOR ANY DEFAULT ON THE ABOVE PROVISIONS AND THE ESTABLISHMENT OF ELECTED WORKERS' CONTROL COMMITTEES IN THE ARMAMENTS FACTORIES AND A CENTRAL WORKERS' CONTROL COMMISSION, ELECTED FROM THE WORKING CLASS ORGANISATIONS, AND WITH FULL POWERS OF INSPECTION AND CALLING FOR DOCUMENTS, TO CHECK EXECUTION OF THESE PROVISIONS AND ISSUE PERIODICAL REPORTS.

In the case of the armaments industry, more than any other, regulations and prohibitions are valueless without adequate independent inspection and enforcement. Even the expert Inter-Allied Arms Control Commission in Germany in the post-war years was not able to prevent a considerable measure of secret re-armament. Such independent inspection, however, cannot be forthcoming from the state apparatus or the capitalist class, which, as already shown in the previous analysis, are involved up to the neck in direct complicity and collaboration in the armaments traffic. In consequence, independent inspection and enforcement can only be provided from the representatives of the working class, whose interests are directly in conflict with the interests of the whole system of armaments. Such workers' control organs, established throughout the armaments industry from top to bottom, in the war-factories and in the depots of war-materials, as well as in the book-keeping departments, should keep vigilant eye on the production of armaments, check the correctness of the official reports, and maintain guard against any attempt at the secret consignment of munitions abroad.

APPENDIX II.

TOWARDS MONOPOLY.

APPENDIX III.

SHARES IN ARMS.

Note.—This chart has been arrived at by taking the ordinary share values of seven armament firms (Vickers, Cammell Laird, Hadfields, Fairey Aviation, Hawkers, Swan Hunter, Rolls Royce). The chart has been compiled after weighting the figures to allow for the different ordinary share capitals of the company.

APPENDIX IV.

STATEMENT OF EVIDENCE TO BE TENDERED BY THE BRITISH MOVEMENT AGAINST WAR AND FASCISM

The British Movement Against War and Fascism considers the primary purpose of the Royal Commission, appointed as a result of strong pressure by public opinion, must be to examine how the traffic in the means of destruction—which is utterly abhorrent to all civilised people—can be effectively and speedily suppressed.

It is proposed for this reason to offer to the Commission evidence showing:—

(a) That wars now in progress in South America and in China are being fought with arms and munitions supplied by British firms, and that these wars are attended with very great suffering and loss of life to the people engaged.

(b) That British armament manufacturers are at present reaping very high profits from an export trade which is resulting in wholesale slaughter.

(c) That British armament firms are in a position to influence the British and other Governments to give them orders for war material, and that this influence is, in fact, being used.

(d) That persons holding responsible positions in public life, and in a position to influence public opinion, are shareholders in armament firms and that this is a dangerous and intolerable state of affairs.

(e) That, in contravention of the Treaty of Versailles, prohibited war material has been supplied by British firms to Germany.

In general, the British Movement Against War and Fascism wishes to point out that it is here laying before the Commission only a small selection of the available evidence. It has been concerned only to establish a *prima facie* case that the allegations made are capable of substantiation. It conceives it to be the function of the Commission in the exercise of its powers to investigate in the fullest detail the conditions which cannot be satisfactorily examined by bodies not provided with judicial powers.

A. WARS IN SOUTH AMERICA AND CHINA.

It is unnecessary here to produce evidence of suffering and loss of life in the war between Bolivia and Paraguay which has now been in progress for nearly three years. According to *The Times* newspaper in one battle alone in August, 1934, there were 11,000 casualties. According to official figures British armament firms have supplied large quantities of war material to both Governments.

<i>Exports to Bolivia, Jan., 1932—June, 1933.</i>		
Ammunition	...	2,130,550 rounds.
Machine Guns	...	99
Tanks	...	6

<i>Export to Paraguay, Jan., 1932—Jan., 1933.</i>		
Ammunition	...	16,570,000 rounds.

But the full extent of the arms trade to those Governments from Britain does not necessarily appear from export licence figures. This is illustrated by the statement in a letter from Mr. John Ball, of the Soley Armament Co., London, to the American Armaments Corporation, which was tendered in evidence to the Senatorial Inquiry in America.

"We have heard that Bolivia wants anti-aircraft guns quickly, but we do not for a moment think that shipment or sale to Bolivia could be made direct while that country is at war. If, however, an American firm of some standing bought the guns for eventual resale, things might be easier, or if the Columbia Government, who are not at war, bought the guns, they could no doubt have them."

Minister Enrique Bordenava, of Paraguay, during his evidence at the same Inquiry, claimed that he had documents showing a New York Loan to Bolivia of \$5,100,000 to pay for a \$14,000,000 Vickers arms contract. (cf. *New York Times*, Sept. 16th, 1934.)

In the same letter of Mr. John Ball reference is made to the export of arms to China.

"As you are doubtless aware, China consumes vast quantities of small arms every year. They have bought large quantities of rifles from us—over 100,000 in 1931 and 1932."

The official export figures show that in the period August, 1931, to June, 1933, exports from Britain included:—

46,270,000 cartridges.
484,462 lbs. cordite.
80 machine guns.
12 amphibian tanks.

B. ARMAMENT PROFITS.

Extremely large profits are being made by British armament firms both as a result of wars waged abroad in the last few years and in some cases still in progress, and as a consequence of war preparations in Europe and all over the world.

Tables of Income and Profits.

	Vickers, Ltd. (Gross Income.)	I.C.I. (Net Profits.)
	£	£
1932	777,475	4,729,072
1933	728,246	6,001,605
1934	958,678	6,349,107

It is particularly significant that the recent tension in Europe has coincided with a spectacular rise in British Aircraft Shares.

	Price.		Rise in Market Capitalisation.
	Jan. 3rd.	May 10th.	
			£
Rolls Royce	108/9	137/6	1,131,565
Napier	12/6	13/7 5	122,850
Hawker	23/9	32/9	720,000
Faircy	21/-	25/6	375,000
De Havilland	53/9	65/3	230,000
Handley Page (Pref.)	14/-	21/4 5	193,582
Boulton Paul	4/6	11/2	337,500
		Total	£3,110,497

On the capital as at Jan. 1st.

(*News Chronicle*, May 11th, 1935.)

The close dependence of the profits of Vickers, Ltd. on contracts for war material is illustrated by the statement of that Company's Chairman on March 28th, 1928:—

"Unless armament orders are available, it will be difficult to earn satisfactory profits."

C. POWER TO INFLUENCE GOVERNMENTS.

It is particularly difficult to lay a large quantity of evidence before the Commission on this subject, but it is submitted that the following quotations show clearly that influence is brought to bear, and the Commission is urged to inquire very fully into this question:—

"The associations of myself and Major Clarke with Admiral Chatfield for a considerable period of time have been unusually cordial, and he has on many occasions smoothed down obstacles in our path."

(Sir Robert Hadfield, at the General Meeting of Hadfield's, Ltd., manufacturers of shells and armour plating.)

"I have had a word with the director of contracts at the Admiralty, who is a friend of mine, and would like this. He, I know, tried to get us the order for all five submarine last year."

(Letter from Sir Charles Craven, Managing Director of Vickers, Ltd., Oct. 7th, 1927, quoted in the U.S.A. Arms Inquiry.)

"MY DEAR MR. SPEAR,

"The Germans are moving terribly in Spain, and unless we all combine against them, we may find them installed one day, and action is necessary.

"The U.S. Ambassador in Spain is a very clever gentleman and highly esteemed, and I think you should arrange for instructions to be sent to him from your State Department, for him to tell the Spaniards that the U.S. Government work very harmoniously with the Electric Boat Company, and that the U.S. hopes that the Spanish Government will be satisfied with the guarantee of the Electric Boat Company and that of Vickers, and will require no other guarantee.

"The British Government will be hard to move in the same direction, but when you inform me that your Government have given the necessary instructions to their Ambassador in Madrid, I will have no difficulty in persuading the British Government to do it too.

"Yours sincerely,

"BASIL ZAHAROFF."

(Letter from Sir Basil Zaharoff to Mr. Spear, of the Electric Boat Co. Quoted in U.S. Arms Inquiry.)

The fact that British armament firms are accustomed to sell their goods to foreign governments is calculated to disturb friendly relations between the British and other foreign governments. Such a situation arose in February, 1933, over a consignment of arms from Italy to Hungary, which led to the despatch of a note of protest by the British and French Governments to the Austrian Government (February 11th, 1933). This was not a case in which British firms were involved; but in May, 1935, the Italian Government took great exception to the importation of arms into Abyssinia, in which British firms have played a part.

D. INFLUENCE OF ARMAMENT SHAREHOLDERS.

Quite apart from any question of personal integrity, the present situation in which prominent public figures are shareholders in British armament firms, and in consequence financially interested in the profits of those firms, is on principle dangerous and intolerable. It is clearly not in the public interest that those in a position to sway public opinion should have any financial interest in the arms trade.

It has recently come to light that Sir George Clive, K.C.B., while holding the appointment of Military Secretary to the Secretary of State for War, was the largest single shareholder in the banking firm of Dawney Day. This firm in turn held £250,000 in the firm of Andrews Toledo, being over 50 per cent. of that firm's capital. This firm is engaged mainly in armament manufacture. It is also to be noted that Vice-Admiral Sir George Goodwin-Goodwin, who held the appointment of Engineer-in-Chief to the Fleet, 1917-1922, was later Managing Director of this firm.

A short selection of shareholders and directors of Vickers, Ltd., is here produced; it will be found to include many persons who have held important appointments in the fighting Services:—

Rt. Hon. Sir John Gilmour, P.C., M.P.

Sir Robert Horne, M.P.

Lord Clinton.

Marquis of Linlithgow.

The Ven. Archdeacon S. H. Phillips.

Rev. Arthur Preston, Bishop Suffragan of Woolwich.

The Rev. Ed. H. Firth, Hon. Canon, Winchester Cathedral.

Colonel H. A. Barclay, C.V.O., A.D.C. to the King, 1910-25.

Sir J. S. Wardlaw-Milne, M.P.

Stuart J. Bevan, M.P., Recorder of Bristol.

Harold P. Mitchell, M.P., Private Secretary to Under-Secretary for Overseas Trade.

Gen. Sir Herbert Lawton, Chairman.

Gen. Sir J. F. Noel-Birch, Director.

Lieut.-Col. J. B. Neilson, Director.

Com. Sir Charles Craven, R.N., Director.

K. REARMAMENT OF GERMANY.

It is now officially admitted that Germany has been rearming, at first secretly and now openly, in violation of Part V of the Treaty of Versailles. There are indications that British firms have taken a considerable part in this rearmament, though not necessarily in contravention of the strict letter of the Treaty, and despite the existence of the export licence system.

It will be remembered that at the annual meeting of Vickers, Ltd., held on March 25th, 1934, the attention of the Chairman was called to an advertisement inserted by Vickers, Ltd., in the German military organ "Militär-Wochenblatt", in 1932. This advertisement contained a picture of a tank, one of the weapons forbidden to Germany. When asked to give an assurance that Vickers arms and munitions were not being used for the secret and prohibited rearmament of Germany, the Chairman replied:—

"I cannot give you an assurance in definite terms, but I can tell you that nothing is done without the complete sanction and approval of our own Government."

Large numbers of aeroplane engines adapted to military uses have been exported to Germany. In May, 1934, 80 Armstrong Siddeley engines were ordered in England. It was stated in the House of Commons by Sir John Simon that this order did not conflict with the Versailles Treaty. Similarly the London Rolls Royce works have sold to Germany many of the new "Kestrel" engines. These engines are used in England in the following types of military aeroplane:—

Hawker Fury (One-Seater Fighter).

Hawker Demon (Two-Seater Fighter).

Hawker Hart (Day Bomber).

Hawker Nimrod (One-Seater Fighter).

Westland Wallace (Day Bomber).

Handley Page (Night Bomber).

Hawker Osprey (Reconnaissance).

Shortt Singapore (Seaplane).

To summarise, the British Movement Against War and Fascism draws the conclusion that the Royal Commission must needs, after a careful consideration of the evidence, declare itself in favour of the prohibition by law of the private manufacture of and trade in arms; such prohibition to be enforced by the imposition of severe penalties, including long terms of imprisonment, on those guilty of serious contravention.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE
TAKEN BEFORE THE
ROYAL COMMISSION ON THE PRIVATE
MANUFACTURE OF AND TRADING IN ARMS

FIFTH DAY

Thursday, 20th June, 1935

PRESENT :

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Mr. J. T. WALTON NEWBOLD, M.A., called and examined.

727. *Chairman*: Are you Mr. Walton Newbold?

Mr. Walton Newbold: I am.

728. *Chairman*: You have prepared a statement and we now have it in print and I think you may assume that we have all read it. What course would you like to take with reference to the evidence that you wish to give us? Will you read this statement, or will you make a statement, or will you deal with this statement partly by reading and partly by comment?

Mr. Walton Newbold: I am entirely in your hands, Mr. Chairman.

729. *Chairman*: I think, if you leave it to me to decide, the most convenient course would be that you should read it, and then we should ask you questions upon it.

Mr. Walton Newbold: Do you wish me to read it straight through, or paragraph by paragraph?

730. *Chairman*: Straight through.

Mr. Walton Newbold: Do you wish me to stop at the end of each paragraph and submit to cross-examination?

731. *Chairman*: No, read it through.

The Witness read the following statement:—

I submit this Memorandum to the Royal Commission on the Private Manufacture of and Trading in Arms, not as the spokesman of any propagandist body, but as a private citizen who has made a study of this problem in all its manifold ramifications at home and abroad over a period of twenty-three years.

In 1912, upon leaving the University of Manchester, I took up this study. As a member of the Society of Friends I was concerned to remove the cause of war. As a Socialist propagandist I was interested in presenting a case as strong as possible against private enterprise and private profit. As a trained research-worker in economic history I was determined to arrive at and to present the facts regarding a border-line case of public demand and of public supply which, the further I pursued by objective inquiries, I came to regard as fundamental to the development of the state and to the technical and the commercial progress of all civilised peoples.

I wish to say and have, indeed, come before you specifically to say in the most emphatic manner possible that, whilst I have held similar beliefs myself and so can understand and, in some measure, sympathise with many of the conceptions of the

nature and conduct of the manufacture of and trade in arms advanced by Lord Cecil, Mr. Arnold-Forster and other *bona fide* pacifists, deeper and more detailed studies have compelled me to reject the theory that the manufacturers of war-material are in any serious sense contributory factors in the promotion of war-scares.

Much play has been made with the interest that shareholders in companies manufacturing and selling war material must have in the extension of their business and the incentive they must have to discourage the propaganda of disarmament.

Were these companies either the sole or even the major sources of income in the case of the persons singled out for exposure then there might be something plausible about the argument.

Members of the Society of Friends are much put out because of the statement that Mr. Barrow Cadbury appears as a shareholder in Imperial Chemical Industries Ltd. for 30,875 preference shares. He is only one of several and holds these (or did hold these for, I understand, he does so no longer) in trust. They represent an investment in a company that has been amalgamated with the arms producing branches of the Imperial Chemical Industries Ltd. but which was itself in no way connected with that other part of the business which was and is engaged in the manufacture of arms.

I have known Mr. Barrow Cadbury for twenty years. He was one of the gentlemen who found the money to publish my book, *How Europe Armed for War, 1871-1914*. He was, I believe, one of the largest guarantors. That book was subsequently published in Russia by M. Maisky, now Soviet Ambassador to this country and, later, by the Commissar for War of the Soviet Union, M. Trotzky, as a text-book for the Red Army.

But, if it is ridiculous to suggest that Mr. Cadbury is likely to be prejudiced by a holding of some 30,000 shares, what shall we say of the relatively small holding to which Mr. Arnold-Forster had reference in the case of Sir John Gilmour (3,066 shares in Vickers) or the still more insignificant holding of Sir Philip Cunliffe-Lister (25 shares in Vickers)?

The bare facts concerning this interest of M. de Wendel are given in the course of a well-argued tract entitled *The Private Manufacture and Trade in Arms* by Mr. Noel Baker who is, like Lord Cecil, I believe, connected with the League of Nations Union. In this tract and in a section entitled "The

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

Evil Effects of Private Manufacture of War Munitions" and of a sub-section headed "Armament firms have sought to influence public opinion through the control of newspapers in their own and foreign countries," Mr. Baker writes:—

"Some years ago M. de Wendel, the President of the French Comité des Forges, acquired a controlling interest in the great French paper, *Le Journal des Débats*. Shortly afterwards he bought a controlling number of shares in the *Temps* for his colleague, M. de Peyerimhoff. Both papers . . . have opposed disarmament."

I have investigated the economic activities of M. François de Wendel both in Lorraine and in Paris. I have done the same in the case of M. de Peyerimhoff. M. François de Wendel has never made a gun in his life. His firm has never made a gun. It would be as reasonable to charge Sir Andrew Duncan or Sir William Larke of the British Iron and Steel Federation with being interested in the arms trade as to charge M. François de Wendel as President of the Comité des Forges de France. It would be as reasonable to charge Mr. Evan Williams of the Mining Association of Great Britain as M. de Peyerimhoff of the Comité des Houillères de France.

I am prepared to give to the President of the Royal Commission the sources of my information as to the activities of M. de Wendel, M. de Peyerimhoff and the firm of Messrs. Schneider & Cie. of Le Creusot. I am prepared to give to the public information as to the reason why those to whom Lord Cecil and, I am sure the same is true of Mr. Noel Baker, in all innocence of purpose, have gone for their facts, have sought to stir up in this country prejudice against the Comité des Forges de France, and to name the identity of the persons concerned.

In this country, I know of one connection between an arms firm and a newspaper. It is that of Major General Dawney. He is a director of Vickers-Armstrong, Ltd., and of the Economist Newspaper Co., Ltd. I do not know that anyone has ever accused the *Economist* of crabbing disarmament.

Formerly, I am informed, the firm of Vickers, Ltd., had two other links with the Press. Sir Basil Zaharoff financed in Paris the *Excelsior*.

Sir Trevor Dawson in London was a very large shareholder in Odhams, Ltd.

But Vickers, Ltd., has been re-organised since those days and I do not think that the present directors enjoy the friendship of the *Daily Herald*.

Newspapers are certainly influenced by considerations such as the giving or withholding of advertisements. Some are even in receipt of subsidies. Here, again, I think we can take it that the degree of dependence on the advertisement or the subsidy tends to determine the degree of the influence exercised upon the policy of the paper. Mr. Pollitt and I could both give you at least one example, but it would concern not an arms firm so much as a government which owns and operates its own arms factories.

My impression is not that the newspapers which advocate an increase of aeroplanes or a Peace Ballot are disinterested, but that they publish very little which will not attract and retain customers. Except for those newspapers which publish special supplements and have a wide sale abroad, the custom of the arms manufacturers in their role of advertisers is of very little value and, again, I have not observed that either the *Economist* or the *Manchester Guardian* shows a disposition to pander to the arms trade.

Therefore, I submit the suggestions and the insinuations have no substance and can be backed by nothing that you, Sirs, are entitled to accept as evidence enough to disestablish the innocence of the British arms manufacturers.

Earlier in the pamphlet quoted above and at the beginning of his argument concerning "The Evil Effects of Private Manufacture of War Munitions" Mr. Baker refers to a case which has already been

named repeatedly in evidence before your Royal Commission. He refers at some length to

"a certain Mr. Mulliner, manager of the Coventry Ordnance Works. . ."

Summing up the facts as he appears to know them—and Mr. Noel Baker did not become connected with Coventry till nearly 20 years after the case in question—he says:—

"If there were no other story extant about the work of 'Armament Interests', the case of Mr. Mulliner alone, it seems to me, would furnish evidence enough to condemn the whole system of private profit from armaments and war."

Mr. Noel Baker, having summed up the facts as he has read them, goes on to say:—

"But Mr. Mulliner's story does not stand alone."

I desire to be allowed to submit evidence to show why I think he is completely mistaken and why I have held for 20 years the exactly contrary belief that it does stand alone.

The full story, Mr. Baker says, is told by the late Mr. G. H. Perris in *The War Traders*. This pamphlet was a reprint of a speech made by Mr. Perris at the Conference of the National Peace Council at Leeds in 1913 in which I took part and, after which, Mr. Perris gave me every encouragement to continue the investigation into this and other aspects of the arms trade. In 1914, I examined this case in a separate pamphlet and, in 1916, I devoted to it a special section in my book *How Europe Armed for War, 1871-1914*.

Further research showed quite clearly that the activities of Mr. Mulliner were part of an internecine struggle inside the private arms trade resulting from antagonisms caused in Birmingham and, later, in Coventry by the entry of the Vickers interests into the arms trade of Birmingham and their acquisition of an interest in and the furnishing of capital to William Beardmore & Co., Ltd., to expand their arms trade on the Clyde in competition with and immediately below the property of John Brown & Co., Ltd., who were the principal shareholders in the subsequently created Coventry Ordnance Co., Ltd.

The whole case showed that there was very far from being a close "ring" of armament firms. Between Vickers and John Brown & Co. the very reverse was the truth.

There is just one other case to which I should like to make reference because it bears out the argument that further research upset in my mind the earlier impression of the existence of "a War Trust."

I can hand in to you the reports of the case tried in the Imperial Courts of Japan regarding an admiral who was found guilty of taking bribes from the shipyard manager at Barrow-in-Furness of Vickers, Ltd.

It is the only proven case of bribery which I have ever been able to find and, rest assured, it was not for lack of effort to find such cases. It showed that, whatever were the close relations required by His Majesty's Admiralty and War Department to be maintained here at home between Vickers and Armstrong Whitworth & Co., they were most fiercely competing in Japan. It was not a case of bribing to get a battleship built but of bribing to get the contract away from a rival British firm.

Finally, I can give you another from an earlier date and concerning a design submitted by the late Sir E. J. Reid for two battleships for Chile and which negotiations showed quite conclusively that Vickers, Ltd. were trying fiercely to take the order for guns away from Armstrong Whitworth.

In the light of these instances drawn from the detailed researches I have made into the private trade in arms, I submit that the arguments based on a tract (which is now the sole one of its kind to which the author attaches his name and which is not now out of print) critical of the continued

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

"Private Manufacture and Trade in Arms" are without adequate foundation and cannot be supported.

Further, I would submit, the unstable foundations of its manufacturing prosperity in a period of grave crisis in industry, once again as during the trade depression of 1907-08, pre-dispose the capital and labour locally engaged in the engineering trades of Coventry to have an altogether unique desire to perpetuate a steady demand by the state for war-material.

As a Quaker, I fail completely to see how the elimination of the profit taken by absentee shareholders, as recommended by Mr. Noel Baker, whilst leaving the incentive of the abnormally high wages to be expected from making shells and grenades and aero-engines and aeroplanes and armoured cars and machine-guns, in factories taken over and run by the State, is calculated to strengthen the peace sentiment of Coventry.

As an economist who has been at pains to visit many factories engaged in the manufacture, or with plant suited to the manufacture, of munitions such as are made at Coventry, I have been struck for years and in all parts of Europe and the United States ever more forcibly by the immense amount of capital that needs to be sunk in machine-tools, many of them suited only to the execution of some particular kind of operation or even of some specific contract. The tendency throughout the arms industry has been to the ever more complete transfer of the factor of skill from the mechanic to the machine and so to make this form of employment progressively and proportionately less remunerative to capital and more so to labour. Very much of the machinery in course of rapid technical transformation and so the subject of replacement and of repeat orders I have found, in going round British arms factories, to be made actually by the workers of Coventry.

In view of this, I do not wonder that the trade unionists of that city should favour less the abolition of the manufacture of arms than its nationalisation. I do not wonder that they prefer as their political spokesmen those who leave to them the high wages and even hold out hope of making them higher by taking away the profit from their employers.

The tendency to transfer of skill from the mechanic to the machine is something which has been progressive and has facilitated the elimination of the master-gun-maker and the skilled artificer, so leading on to the concentration of the manufacture in great establishments wherein the standardisation of processes has followed the intense sub-division of labour down (and up) the scale of industrial organisation. This has led to the ever more numerous contacts of one group of capitalists in this industry with others at home and abroad. This tendency is inherent in the type of industry whose technique makes it available for the alternative manufacture of products of the highest metallic quality and the finest machine finish and so absolutely compels ever greater and greater calls upon and concentration of capital.

Because I am well aware that early writings of my own led many persons in the Peace Movement and in Labour circles to believe in the existence of "a War Trust" i.e. of a close "ring" of arms manufacturers internationally organised to make profit out of "armour-clads", and because the conditions under which I was writing in war-time made it impossible and undesirable to say many things about the armament firms and the governments which I could have said in time of peace, I desire to take this opportunity of correcting a bias against the truth which I feel I have helped to create.

When starting out upon my researches in 1912-13 I attached an altogether undue significance to two internationally owned companies interested in the manufacture of armour-plate.

One of these had developed in the nineties and, finally, had been organised and registered in this country in July, 1901, nominally "to carry on business as manufacturers of armour plate". Actually, it did no more than amalgamate the control of the Harvey, Charpy and Krupp processes for the manufacture of armour-plate. It became evident to me as I pursued my researches that it contented itself with regulating, renting and allocating the royalties from what were a series of American, French and German patents that were, I was later to discover, even then coming to have little technical importance.

The other was an endeavour on the part of the armour-plate and gun-producers of most countries to break the international monopoly control of nickel which the scarcity of this essential alloy of armour and of gun-steel had placed in the hands of a group of finance houses interested in the monetary and the munition-making metals:—silver, zinc, copper, tin and nickel.

One of these companies—which I found first and took to suggest the existence of a close "ring" of arms makers—was the Harvey United Steel Co., Ltd. It had obvious contacts with the United States Steel Corporation.

The other was the Steel Manufacturers' Nickel Syndicate Ltd. and that seemed to have especially close contact with the Bethlehem Steel Corporation, also of the United States.

Both these companies were registered in 1901 and seemed to have their headquarters in the London offices of and to be closely connected with Vickers Sons and Maxim, Ltd.

This year 1901 was that in which Vickers secured the lease of the Holland submarine patents, afterwards taken over by the Electric Boat Company of the United States.

I submit that the coincidence of these happenings was bound to lead to misunderstanding especially in view of the fact that the critics of the arms trade were all under the influence of a Liberal economist of pronounced Free Trade as well as Pacifist bias who attached immense importance to the artificial tendencies towards the formation of cartels and combines and of the influence of the persons promoting these on what he called "Modern Imperialism."

I published *How Europe Armed for War* and the whole of my writings on the arms trade whilst still under the influence of this Liberal economist (Mr. J. A. Hobson) and before the issue of the Report of the Federal Trade Commission of the United States on "Co-operation in the American Export Trade" made available in detail the facts re the existence of the quasi-natural monopoly of the metals to which the Steel Manufacturers' Nickel Syndicate was the consumers' defensive retort.

I refer to the far more closely-knit and certainly all-world combination profiteering out of war-preparedness, viz. "the Metallbank" and "the Metallgesellschaft," both of Frankfurt-on-Main.

The coincidence of the battles of Verdun and of the Somme caused me to consider the problem now and henceforth to be presented of the supply of the prodigious masses of metal and the vast stores of chemicals being used in the new warfare of fixed positions. Gone were the days of occasional naval actions with a relatively few broadsides and of intermittent military engagements in the field with a few hours of heavy cannonade and a few minutes of intensive machine-gun fire. To the *levy en masse* and the employment of the artillery train with which Napoleon I had ushered in the nineteenth century had been added all the mechanical, chemical and metallurgical technique applied to industry throughout a hundred years. Railway and automobile transport had made practicable the barrages of the Western Front and the advance of the submarine had necessitated by sea as well as on land a quantitative change in the demand for and the

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

supply of armaments which had rendered inadequate the old system of supply of armaments and was, after the war, to complete the ruin of the old arms trade of which, seemingly, the pacifists are even yet not aware and which they seem inhibited by their outlook on the material world from being able to appreciate.

I submit to you that there is a profit to be made out of arms supply not only—or, for the reasons already indicated earlier in this Memorandum, so much—at the finishing end of the manufacture as by those who are engaged in the buying and selling of the metals. In war-time there is for these not so much competition in supply as in demand, and the material is, for the most part and in the very nature of the case, not capable of recovery and of melting down again as is the scrap-metal made available in peace-time. Then, there are those who are equipped to replace the vast and varied set-up of machine-tools upon which the wear and tear of war-time is far in excess of anything experienced in peace-time and which must at all costs be kept to the highest rate of production and degree of precision.

In normal times and, more particularly, in a period like the present there is a disposition to defer replacements of machinery and severely to ration supplies of basic materials used in the engineering and the chemical industries. If the motive of self-interest is as strong as the idealists allege it to be in others than themselves and those who think with them politically, then it appears to me that mining and metal interests, machine-tool makers and even trade union officials and rank-and-file trade unionists connected with the metal, machine and armament industries may be expected to favour orders for machine-guns rather than stand idle. In view of the success of the Peace Ballot in the arms making centres, however, this theory can scarcely be entertained.

Economic motives are powerful, but so also are the feelings common to capitalists and wage-workers. The president of the Disarmament Conference had three sons. He lost one in the War. The chairman of Vickers, Ltd., had two sons. He lost both of them in the War.

I suggest that experience has persuaded all thoughtful persons, regardless of their divergent or their conflicting economic interests, of the wastefulness and the horror of war, and that we may discount almost completely motives which may have had much influence in the days of the long peace that preceded 1914.

Eliminating the personal factor and passing from the subjective influence of shareholders and directors to the impersonal factor of the arms manufacture and trade *vis-à-vis* other aspects and as a part of the totality of the economic system, is it not reasonable to seek the motive of those who stress the importance of the arms manufacture in the theories which they entertain as to the place it occupies in the evolution of capitalism?

I submit that we have in the writings of Lenin on *Imperialism* and of the theoretical studies of the economists of the Soviet Union and of the Communist International (e.g., Varga's *Decline of Capitalism* published in 1928) the visible cause of the renewal in 1928 of the propaganda against the British and the American armament manufacturers. I submit that we have in the desire and the determination to check the recovery of British national economy from the economic and political crisis which reached its nadir in 1931 the revival of the literary offensive against Vickers-Armstrong, Ltd., in 1932. I submit that the Communist and sympathetic writers of *The Secret International*, *The Bloody Traffic*, *Patriotism, Ltd.*, and similar literature in this country and in the United States, have shown by the consistent suppression of facts concerning the armament of the Soviet Union the nature of and the motive of their bias. I submit that they have consistently sought to demonstrate the truth of their

contention that capitalism (and all variants of that system outside of the Soviet Union) is only being rescued from collapse by the intensification of war preparedness and the allocation of orders for war-material to the firms which they alleged to have been reorganised by or with the aid of the Bank of England. I submit that, from the logical extreme of Mr. Pollitt to the liberal draughts made by the League of Nations Union and the National Peace Council upon the literature of the Leninists, the case presented is not based on dispassionate and detailed economic study but follows more or less logically out of the political propaganda of the people who invented the story of "the bankers' ramp" and seek now a moral justification for a partisan onslaught on the private ownership of the banks and the heavy industries.

I am prepared to submit evidence to show the connection of this campaign against certain firms in Britain, the United States and France and Czechoslovakia with the theory and practice of the Soviet's First and Second Five Year Plans, and to that end draw your attention to the circumstances attendant on the arrest and prosecution of the employees of Metro-Vickers.

Were I appearing here as the representative spokesman of the Society of Friends I should need to inform you that I was committed to the principle of unilateral disarmament. Yielding to none in my endeavour to remove the cause of all war—class-war included—I am unable to subscribe to that particular method of applying my peace testimony to the world as I know it.

What I have seen and read and heard of the technique of arms and of arms manufacture in this country and elsewhere convinces me that the first problem to which you should apply yourselves is as to the best method to reorganise, reconstruct and maintain the means for the extremely rapid manufacture, should need arise, of aerial, anti-aircraft and mechanised army equipment as well as the launching and completion of ships to make good sinking by submarines and of ships to counter the submarines.

Since the Royal Arsenal and Small Arms Factory and the Royal Dockyards of Sheerness, Chatham and Portsmouth are survivals from altogether different conditions of warfare by sea and air and a very considerable part of the plant belonging to Vickers-Armstrong Ltd. and other engineering and chemical concerns contributory to the manufacture of war material is located in areas vulnerable to air attack there is need of an immense overhaul of the existing means of manufacture. The question must immediately arise as to how far it will be possible to raise the capital within the limitations of the present system of private enterprise conducted for private profit. I do not think that the money market will make available this capital as a commercial proposition upon the scale and in the time within which it is needful to collect and apply it to the erection of new workshops and the transfer of plant and labour to the west coast and the other areas beyond Birmingham and Sheffield in which the national reserve factories should be situated.

Sentiment being such as it is on the subject, it seems extremely improbable that Capital would provide the money with a view to profitable investment or that Labour would give of its best were there any reason to suspect that munitions were being produced other than with a view of the national and the imperial defence.

First and foremost, reserves of iron-ores from North Africa and Spain and of bauxite and non-ferrous metals should be accumulated forthwith. These should be adequate to enable the munitions to be made in the event of a partial blockade of these shores. Such reserves would not be an economic proposition from the standpoint of the metal and mineral industries and they should be bought and

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

stored for an emergency by the government. Next, there is need of alternative coke-oven and gas-producer and similar auxiliary equipment to that already in existence at our steel plants. For commercial demand the existing equipment is at least adequate but the peril of explosions caused by aerial attack needs that non-economic reserve plants shall be provided or, at least, planned to be erected instantly at the expense of the government. Factories planned for swift erection; factories with the foundations *in situ* and the roads laid to them; factories built and needing only the installation of plant and the turning on of power; factories with the machinery already in and waiting only the movement into them of workers from the nearest centres by rail, road and motor-boat: these should be provided in every Pennine dale, in every Scottish glen and in every Welsh valley . . . at once.

Experts are agreed that we are not in a condition to make the munitions we should—I think we are soon going to—require, save at points where attack from the air would work appalling holocausts of life and awful havoc to communications—e.g., Enfield, Woolwich, Coventry, Sheffield, East Manchester, Derby.

Factories so split up into small units and located in the hills cannot be efficient competitors in the world market or contribute in any real sense to the economic reinforcement of our industries under peacetime conditions of commercial demand. Exceptions there may and, probably, will be; but, apart from the employment they will furnish during erection, they will do little to lessen the problem of unemployment in the distressed areas. The three great steel-works of which we have urgent need to complete the basis of the north-west coast arsenal might become eventual assets to the iron and steel industry but, if they were commercially needed, then there is no reason to suppose that they would still remain to be built.

The reserve arms factories should certainly be owned by the state and, I am inclined to believe, in the event of their being so set up, the existing arms manufacturers would ask to be relieved of their plants and would gladly withdraw themselves into the position of a second reserve of national munitions supply. I understand that they do not see their way clear to sink further capital in plants having a utility limited in time and in freedom of application to manufacture for commercial demand.

The manufacturers of machine-tools and all those who would be called upon to furnish structural steel, to execute the public works contracts involved in erection, as well as those dealing in the metals and the bases of chemical industry would need to be limited as to their profits but, otherwise, should continue owned and operated as before. Nationalisation of industry may be deemed desirable on other grounds. I am not in favour of its surreptitious introduction under the guise of national or even of imperial defence.

732. *Chairman*: There are one or two questions I should like to ask you, and the first one has reference to the two last paragraphs in your statement, where you indicate that in your view the reserve arms factories should certainly be owned by the state. The question I want to ask you is: Are you in this statement assuming that if the reserve arms factories are owned by the state the existing arms manufacturers should be allowed to continue their business, including export business?

Mr. Walton Newbold: I think the existing arms manufacturers have so little export business and the amount of home business that they would have under such circumstances would be so small that, whilst they might be allowed to do it, they are not so foolish as to wish to continue to lose money indefinitely, and therefore I cannot see them carrying on, and I cannot see them raising the money necessary to carry on.

733. *Chairman*: But then you would allow them to continue their export business?

Mr. Walton Newbold: I have not considered this question of the export business in great detail because I think that the whole talk about it is founded on misconceptions. I think there is very little export business indeed going on.

734. *Chairman*: Yes, but you realise, do you not, that if all export business were forbidden the result would be that the existing arms manufacturers would be closed down in the event of war?

Mr. Walton Newbold: I think so. I think it is highly probable that they would.

735. *Chairman*: And that would necessitate unilateral nationalisation in this country?

Mr. Walton Newbold: I think that in any case we shall have to reconstruct our factories at the expense of the government. I cannot see any other way out. I do not think the money can be obtained, because it is not a commercial proposition. After all, war is something which nobody wishes to have. Armaments are an insurance against a very problematical disaster, and war to-day, on the monstrous scale that it is waged to-day, is not something in the nature of the wars of the middle of the seventeenth century, the eighteenth century, or the nineteenth century.

736. *Chairman*: You have indicated that, although you are a member of the Society of Friends, you do not agree with them in their view as to the principle of unilateral disarmament?

Mr. Walton Newbold: Certainly not.

737. *Chairman*: Would you mind giving us your reasons in greater detail for that view?

Mr. Walton Newbold: I personally am a member of a body of people who generally do not fight. The problem was not presented to me in the last war because I was physically unfit for any work whatsoever of that character. The Society of Friends consists of some 25,000 people in this country, most of whom I suppose take this kind of view of unilateral disarmament; but in the late war one-third of them served with the Forces, one-third of them went into relief work and one-third of them took the opposite point of view; because the essence of Quakerism is not peace; the essence of Quakerism is the prompting of the divine spark within a man, and it may put one man in one direction and another in another. Now then, I am a democrat. This country has decided that it is going to have armaments of some kind or another. I can see no earthly chance in this country in my time of people being won to non-resistance. If we are to have armaments, then they must not be armaments or armament manufacture such as that with which this country found itself in 1793, in 1804, in 1854, when the whole national capacity was in chaos, when the arsenal failed us, when every gun contractor failed to give us the stuff. We must be in a condition where when we want to make the material we can make it efficiently. We must remember that this is a country in which people are pacifist in peace-time in vast numbers, but personally I do not think there is a non-resister on your Commission. There may be non-resisters in some places. There are a great number of people suffering from war weariness. There are a great number of people who wish to disarm this country, or at any rate a certain number of people. These people are not pacifists and deserve no consideration as such. Therefore we are reduced to some 25,000 people who in a crisis will still say, "I will turn the other cheek." If I were a Fascist or a Communist I might take the view that those 25,000 people were entitled to dictate to the 45 million people, but if I am a democrat I cannot take that position at all, and therefore I say that if you are going to fight, if you are prepared to have munitions, then get them ready in advance and do not let us have men killed, and wars continued, and costs piled up, and social services in perpetuity ruined, in the way they were at the outbreak of the last war by the kind of unpreparedness with which we were presented in 1914.

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

738. *Chairman*: You said in your statement: "The tendency throughout the arms industry has been to the ever more complete transfer of the factor of skill from the mechanic to the machine and so to make this form of employment progressively and proportionately less remunerative to capital and more so to labour." Now I do not quite follow the argument in reference to "more so to labour." Is not the result the employment of less labour?

Mr. Walton Newbold: No, because constantly in an industry like that of keeping up-to-date the equipment of the Air Force and the continuous improvement of shells and shell fuses and the continuous improvement of guns and so forth, you are constantly requiring more and more machinery to be made, you are needing constant replacement, and you find that as war goes on progressively you get a greater and greater demand for labour, and that labour does not need to expend time very much in learning extra skill. The skill factor is going out but you are constantly having fresh machine tools coming in. I think there has not been anything like enough attention given to the effect of the peculiar conditions of war demand upon the kind of labour employed in war factories. The amount of labour employed in the actual production of the shell gets less and less; that engaged in the production of everything to make the shells gets more and more.

739. *Chairman*: You also refer to a tract "which is now the sole one of its kind to which the author attaches his name". I do not know whether it is one that we have or not; but have you any objection to giving the name of the author so that we can trace it?

Mr. Walton Newbold: *Hawkers of Death: The Private Manufacture and Trade in Arms*, by Philip Noel Baker.

740. *Chairman*: We have it; then I know what it is. Then you refer to the bribing of a Japanese official. What date was that? Was that 1910?

Mr. Walton Newbold: I have the report here in the *Japanese Weekly Chronicle* of 23rd July, 1914, an article on "Corruptive competition." Another strange chapter in the history of the naval scandals is brought to a close by the judgment of the Tokio Court in the Mitsui Vickers case.

741. *Chairman*: Was the date of the actual bribe 1910?

Mr. Walton Newbold: Yes.

742. *Chairman*: You say you have made exhaustive searches, inquiries, in reference to this question of bribery and this is the only case you have been able to discover?

Mr. Walton Newbold: The only provable case. There may be others.

743. *Chairman*: Are you referring to this country or abroad?

Mr. Walton Newbold: I have heard of a case of the firm of Skoda which has been accused of bribery in a certain state in South-Eastern Europe.

744. *Chairman*: If it is a matter which has not been mentioned before I do not think I want you to refer to it; but I only wanted to know when you were referring to your inquiries whether you had confined them to this country or not?

Mr. Walton Newbold: Oh, certainly not.

745. *Chairman*: Then you say: "Mr. Pollitt and I could both give you at least one example, but it would concern not an arms firm so much as a government." I can quite understand that you do not want to mention, nor do I wish to mention, the government, but I think the Commission would like to know the Government you are referring to, and therefore will you give the name to the Secretary?

Mr. Walton Newbold: Yes, certainly.

746. *Chairman*: And the same I would ask you to do with reference to the sources of information which you refer to at the bottom of the second paragraph of your statement, in which you say: "I am prepared to give to the President of the Royal Commission the sources of my information." You would add to that the Commission generally?

Mr. Walton Newbold: I think it is not desirable that we should mention any more than is necessary the officials of friendly powers who may have given information to any of us.

Chairman: But I think the Commission should be seized of the information to which you are referring. Those are the only questions that I have to ask you.

747. *Dame Rachel Crowdy*: First of all I should like to go back to a question which the Chairman has just asked, to ask Mr. Newbold if he would define to us what he considers comes under the heading of a bribe or bribery.

Mr. Walton Newbold: I consider that that is a matter which varies with the standard of morality of the country in which business is being done and the standard of morality of the people doing business. I can conceive that business methods in the country of Ruritania in South-Eastern Europe, which I visited some years ago in a semi-official capacity, are very much different, seeing that the editor of their chief economic paper followed me to the railway station and followed me along the platform at the railway station, pointing out that it would not be possible for us to get any contracts in Ruritania unless we were prepared to grease the officials and the people placing the contracts. I should imagine, knowing the United States pretty well at any rate, and having seen something of the conditions under which public works contracts were being given out in 1933, that they have a very much more liberal interpretation of what constitutes a fair business practice than would be accepted in a British court of law, let alone in leading Nonconformist circles in this country. More than that I would not like to say; and the question then arises as to how far a big employer of labour in this country is to forego export trade, or how far he is to forego his principles. After all, practically all commerce carried on outside of the few countries in North-Western and Central Europe is characterised by what would be called in this country grave irregularities, and I think we are face to face with this problem of how far we can retain our foreign markets if we are to resort to Christian or to legal practices. I think it is impossible to define—

748. *Sir Philip Gibbs*: Are you in favour of bribery?

Mr. Walton Newbold: No, of course I am not.

749. *Sir Philip Gibbs*: You seem to suggest it.

Mr. Walton Newbold: No, I do not. I merely try to face up to the facts of life.

750. *Sir Philip Gibbs*: Admitting bribery as one of them?

Mr. Walton Newbold: I think that it is a case where you have got to abandon the market.

751. *Sir Philip Gibbs*: And you would prefer, therefore, not to abandon the market and to indulge in bribery?

Mr. Walton Newbold: I think that if I was an employer of labour on a large scale I should have to think twice before I refused to resort to bribery to get a foreign contract.

752. *Sir Philip Gibbs*: Therefore may I take it that you are in favour of bribery?

Mr. Walton Newbold: I, personally, should prefer leaving the business rather than carry on.

753. *Dame Rachel Crowdy*: If I may continue, Mr. Newbold has not really quite answered my question. I probably put it badly. Having worked with a certain number of governments in Geneva, I should imagine that there are different interpretations of different labels for honour, but what I really want to know is not how the governments interpret bribery, but how Mr. Newbold himself interprets it, which is quite a different thing. I think he says that he only knows of one case of bribery. When he says that, what does he mean in that case exactly by bribery? That is what I am really trying to get at.

Mr. Walton Newbold: In this case it was a matter of an agent to the firm of Vickers desiring an order for a battleship for their clients, Vickers,

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

and I believe that the sum of money which they made available was 400,000 yen, and thereby it is believed that they took the contract away from a more anciently established firm in the trade. I should call that bribery of the grossest kind.

754. *Dame Rachel Crowdy*: But is there anything else that you would include under bribery except *pourboire* of that nature?

Mr. Walton Newbold: Oh, many things—titles.

755. *Dame Rachel Crowdy*: And you have never come across any other case of bribery whatsoever in connection with your investigations into the arms trade?

Mr. Walton Newbold: I did not say that, *Dame Rachel Crowdy*. I said that I had never found another case which I could establish in a way that would be appreciated, I think, in a court of law.

756. *Dame Rachel Crowdy*: Do you include commissions, whatever one may call them, given to government officials who expedite the putting out of contracts to certain firms? Does that come under your heading of bribery?

Mr. Walton Newbold: Yes, if you can find a case and prove it.

757. *Chairman*: Yes; but what I think *Dame Rachel* is asking you is what kind of operation would you include in bribery? Of course, in this country it is a statutory offence.

Mr. Walton Newbold: Exactly.

758. *Chairman*: And it is defined; you know it is defined?

Mr. Walton Newbold: I know.

759. *Chairman*: And it is so widely defined that it covers every case of what is known broadly as bribery?

Mr. Walton Newbold: Yes.

760. *Chairman*: And you would accept that definition; I mean every means?

Mr. Walton Newbold: Exactly—in this country; but I have found, going around the world, that it is impossible for people in certain countries to understand that things can be like that.

761. *Chairman*: Quite. I think what *Dame Rachel Crowdy* wanted to know was whether you were confining your statement to one particular kind of bribery?

Mr. Walton Newbold: Oh no; I think there are innumerable forms of bribery and blackmail.

762. *Dame Rachel Crowdy*: And you have only come across this special case as proved?

Mr. Walton Newbold: This special case is absolutely proven. I think nobody has ever thought of challenging it.

763. *Dame Rachel Crowdy*: And you know of no other case as proved?

Mr. Walton Newbold: No.

764. *Dame Rachel Crowdy*: Then you say: "I am prepared to give to the President of the Royal Commission the sources of my information as to the activities of M. de Wendel, M. de Peyerimhoff and the firm of Messrs. Schneider & Cie. of Le Creusot. I am prepared to give to the public information as to the reason why those to whom Lord Cecil and, I am sure the same is true of Mr. Noel Baker, in all innocence of purpose, have gone for their facts, have sought to stir up in this country prejudice against the Comité des Forges de France and to name the identity of the persons concerned." I feel it is not indiscreet to ask this question as you said "I am prepared to give to the public information." Could you give us some of that information, or am I to assume that in a way it is answered in the later paragraph in which you say what you think was the origin of the propaganda against the armament manufacturers.

Mr. Walton Newbold: No, I do not think it is at all under that paragraph. I think that the matter comes under an entirely different heading.

765. *Dame Rachel Crowdy*: Then would you very kindly answer?

Mr. Walton Newbold: I am referring to the activities of the organisation which publishes *Patriotism, Ltd.*, and *The Secret International*. I am referring to the activities of an organisation founded by E. D. Morel, which has persistently pursued over a period of years the policy of criticism of French interests, suppressing facts, in my opinion, that are not relative to (i.e. do not support) the attack upon France. I think that we have to go back to the whole sordid story of the struggle for iron ore in Africa and in Spain before the War, when it was desired to keep the French from developing those wonderful resources of iron ore which are absolutely indispensable to the manufacture of gun steel. You can make shell steel out of basic iron ores. You cannot make gun steel and you cannot make the finer armament steels except out of the materials that are called haematite ore. Now, the Germans set out to establish a monopoly in the control of haematite ore in Morocco. My authority is *The War of Steel and Gold*, by H. N. Brailsford. That is the written authority. I have had it on many occasions from mining engineers who were operating in that part of the world. Now, I have watched this consistent attack on the attempt of Britain and France to prevent the monopoly control by Germany. I have watched the consistent attempt to sow ill-will between this country and France through alleging that the French, in particular, are under the influence of big interests. I have seen the consistent suppression of facts in the case of Germany and in the case of Russia, and I can draw no other conclusion myself than that these people are, either in woeful ignorance or in wilful error, seeking to drive this country and France apart and to prejudice the relations of this country with France. I do not know what reason may be behind it; it is not pertinent for me to say; but I do know, at every single point where I could block them, I have blocked them. The reason why I went to Motherwell in 1918 was to prevent the selection as a Labour candidate for a great steel-producing locality of a person of the character of E. D. Morel, and I think that the tradition of E. D. Morel is maintained by the Union of Democratic Control. That is the body to which I refer and the people to whom I refer. I think it is contrary to the public interest.

766. *Dame Rachel Crowdy*: Then I have one other question. You say: "I submit that the Communist and sympathetic writers of *The Secret International*, *The Bloody Traffic*, *Patriotism, Ltd.* and similar literature in this country and in the United States have shown by the consistent suppression of facts concerning the armament of the Soviet Union the nature of and the motive of their bias." May I ask you who is the author of *The Bloody Traffic*?

Mr. Walton Newbold: Mr. Fenner Brockway is the author of *The Bloody Traffic*.

767. *Mr. Spender*: Just to get this clear, you are in favour of the state taking over the manufacture of armaments, but on strategic, if I may so call them, and not on moral or economic grounds?

Mr. Walton Newbold: No, it seems to me a matter of indifference whether you kill a man with a state-manufactured gun or a gun made for private profit. My attitude is entirely based on strategic and economic grounds. It is a disagreeable necessity.

768. *Mr. Spender*: I understand that. You say, having made up your mind that armaments are necessary and that unilateral disarmament is impossible, you desire efficient and sufficient armaments, that pacifism is not promoted by inferior armaments?

Mr. Walton Newbold: I think that pacifism may be promoted by complete disarmament or else it may be promoted by efficient armament; but I cannot see any purpose that is to be gained by inefficient armament.

769. *Mr. Spender*: Now, with regard to these interests, whether the manufacture of armaments is undertaken by the state or by private firms, I suppose it would still be true that certain great

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

interests, the great basic industries, would have an interest, a motive, for desiring them to be kept at a high level?

Mr. Walton Newbold: Well, it all depends how far they are to be defined as armament firms. I went over Elswick in 1914, and I went over Beardmore's in 1914. At that time they were engaged almost entirely in armament work. I could not honestly say, after being over Elswick in the last six weeks, that they were exclusively engaged on armament work. It would be absolutely impossible to say, unless you were grossly mis-stating the fact, that a firm like the Birmingham Small Arms Company, or a firm like the English Steel Corporation, or a firm like Vickers-Armstrongs at Barrow to-day were primarily engaged in the manufacture of armament material. They are much more heavily engaged in the manufacture of material for commercial and luxury automobiles, they are much more engaged in the manufacture of all kinds of material for public works of one kind or another. No doubt when you all visit the representative factories of this country, as I have no doubt you are going to do, you will see what is being carried on there; but quite frankly, I believe that in the case of the Birmingham Small Arms Company you will receive information which will show to you that not one single department of their business has in the last five years done 10 per cent. of exclusively armament work. I could not give you the figures precisely. I do not know whether you desire them to be kept confidential. I do not know whether the firms desire it, but I have deliberately tried to find the proportion in case after case. Now, if you go to Woolwich Arsenal, of course you will find that everything there is at present war work, but if you go to the arms manufacturers, you find that you are dealing with general engineering concerns. I expect that you have had, or will have, the various catalogues. I have a collection of catalogues from practically every big engineering firm in Europe. I have got three typical examples here, if the Commission like to have them. As an economist who studies the development of the heavy engineering and steel industries, naturally I try to know something about them, and I have here one for Krupp, one for Schneider, one for Vickers. If you like to have them, you are welcome to have them, and if you like to have them for a dozen other works, I will provide them for you by to-night. The arms trade to-day is not an arms trade as it used to be.

770. *Mr. Spender:* I am afraid I did not quite make my point clear. It is suggested to me by what you said about the Comité des Forges. I do not pretend to have any intimate knowledge about that subject, but we have had a good deal of evidence to suggest that the agents who have been most active at armaments conferences at Geneva and elsewhere have not been appointed by the armament firms, but by the great industries, the shipping industry and the iron and steel industry, and it would seem to follow from that that whatever organisation you have, whether it is state or private manufacture, these great industries would still, if we are thinking of it in economic terms, have a motive for agitating as they do agitate?

Mr. Walton Newbold: I think that the nickel interests will always have a motive, because nickel is so enormously used in armaments, more, I believe, in armaments than in anything else. I should think that the zinc interests and the copper interests would also have to watch. I do not think it necessarily means that because they are watching what is happening at Geneva, they are doing more than watching the possibilities of their trade.

771. *Mr. Spender:* Well, I think that is possible. I am not suggesting that it is necessarily a serious interference. The only thing is that whatever organisation you have for making armaments, you would have a great number of interests who will naturally have a motive, or would like to see that trade active?

Mr. Walton Newbold: You will always have people like Mr. Shearer.

772. *Mr. Spender:* You may carry it to the making of boots and shoes?

Mr. Walton Newbold: You will always have people like Mr. Shearer, and he will probably get the sack afterwards, like Mr. Mulliner got the sack at Coventry Ordnance. Such people are to be found in all business life, and in all professional life, but I do not think it is quite reasonable to say that Mr. Shearer is typical, or to say that Mr. Mulliner was typical. I think they are exceptions. If you look all over the place and you find no more examples, you are bound to say they are exceptions; and that has been my experience.

773. *Sir Philip Gibbs:* You started by saying that "as a member of the Society of Friends I was concerned to remove the causes of war." Are you still concerned?

Mr. Walton Newbold: Exactly; but I do not think that this is removing the causes of war.

774. *Sir Philip Gibbs:* Because, in your general argument, you do not deal very much with the causes of war, but you seem to take it for granted towards the end of your statement that war is going to happen?

Mr. Walton Newbold: Yes, I think it is.

775. *Sir Philip Gibbs:* And you wish to make factories in every Scottish glen and in every Welsh valley?

Mr. Walton Newbold: I did not say that, if you will read—

776. *Sir Philip Gibbs:* I want to know. You seem to have abandoned, in this statement, any attempt to remove the causes of war.

Mr. Walton Newbold: I am not concerned, according to the terms of reference of your Commission, with the means of abolishing war. I could give that evidence before a commission if it was instructed to explore that subject, but your Commission has not been so instructed.

777. *Sir Philip Gibbs:* Then I wish to ask another question. You say you reject the theory that manufacturers contribute to the promotion of war scares. You state that, do you not?

Mr. Walton Newbold: Yes—not seriously.

778. *Sir Philip Gibbs:* If so, do you reject all the available evidence which is accepted by people like Lord Cecil and Lord Davies, and also the League of Nations itself which, in an early paragraph in a convention, took for granted that the private manufacture of arms was the cause of many abuses. Do you reject all that?

Mr. Walton Newbold: Yes, I reject it because I think it is based on a one-sided criticism of the people concerned. You have not yet, I think, heard the case for the defence; you have only heard the case for the prosecution. I represent neither party, neither the defence nor the prosecution, but I do always wish to hear the case for the defence as well as the case for the prosecution.

779. *Sir Philip Gibbs:* Certainly.

Mr. Walton Newbold: I think there have been some very loose statements made, and I think I heard a loose statement withdrawn in this very room yesterday afternoon.

780. *Sir Philip Gibbs:* Now, in your statement you rather suggest that the Mulliner case which has been referred to so often is not of very great importance because it was the rivalry between one firm and another in endeavouring to get an order; but do you therefore also reject the evidence of Mr. Winston Churchill and of Lord Haldane at the time, that the statements put forward by Mr. Mulliner were accepted for a time by the British Government and led to an increase in the British Navy which was afterwards found not to be justified by Mr. Mulliner's statement? Do you reject that?

Mr. Walton Newbold: I am not going to be drawn, Sir Philip, into an answer to that kind of a question. I am quite prepared to deal with the Mulliner case in great detail if you so desire, and

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

to give you the facts; but I would draw your attention to the fact that the government is very often responsible for the things that firms get blamed for, as it is not always deemed in the public interest good that the government should appear either in national or in international negotiations, and I have repeatedly found cases where the people to blame were the government. The Coventry Ordnance Company were persuaded to go into the business by a government, and then, when the government was defeated at the general election, the next government did not pursue the same policy. I do know perfectly well that in the case of Mr. Mulliner, when trade got very bad in 1907 and 1908, he got extremely alarmed; so did the chairman of his company get extremely alarmed. I do not for a single moment imagine that the chairman of the company, Lord Aberconway, ever had any approval of the word of the managing director. I think it was contrary to the whole characteristic of him.

781. *Sir Philip Gibbs*: Do you think that Mr. Winston Churchill and Lord Haldane were misinformed when, in their books subsequently, like *The World Crisis*, by Mr. Churchill, he admits he was misled by Mulliner? Do you think he was misinformed?

Mr. Walton Newbold: I think he was misled by Mulliner, but I am surprised that the First Lord of the Admiralty should have been entirely trusting to Mr. Mulliner. He would certainly have other sources of information at his disposal. Probably he was misled by Mr. Mulliner, but I am sorry that Mr. Mulliner should have been the primary source of information for cabinet ministers. The Secret Service ought to have kept them informed of that, if it is any good at all.

782. *Chairman*: May I ask one question about Mr. Mulliner, if I am not interrupting, Sir Philip? We have heard a great deal about Mr. Mulliner, and apparently what Mr. Mulliner said was incorrect, but nobody has ever informed us whether they thought that Mr. Mulliner honestly believed what he said, or whether he was an inventive scoundrel. Has that ever been cleared up or gone into?

Mr. Walton Newbold: I do not think it has, because when I explored this question, I found that Mr. Mulliner was of much less economic and political significance than he had been made out to be. I found that the literature of the subject referred constantly to Tory directors, and suppressed all reference to Liberal directors, and that the whole thing was used as a piece of political propaganda by the Radicals against the Liberals in the government, and by the Radicals against the Tories, and I dismissed all that case as being mainly political backchat. I think that the importance of that whole matter was that up to 1896 the Vickers interests had not, so far as I know, gone out of the heavy arms industry into the light arms industry. About that time, they went into the light arms industry of Birmingham, and the light arms industry resented it, and nobody seems to have resented it more than Mr. Mulliner, who saw efficiency coming in the place of the methods you have described in terms in which I would rather not describe them. I certainly would not do it outside here, in view of the law of libel; but immediately you got a retort by the interests of Birmingham against the interests of Sheffield, in the ordinary course of commerce, and then you had, in the year 1898, a request by the government for extra facilities for armaments because of the extended Russian programme of the time of 1898, and there was a definite preparation to make guns, gun mountings, armour, and so on.

783. *Chairman*: I think you are going rather beyond what I wanted to know.

Mr. Walton Newbold: Yes, but you cannot explore this problem unless you look at the determining conditions.

784. *Chairman*: I only wanted to know whether it had ever been established whether Mr. Mulliner honestly believed what he said, or whether the contrary was the case.

Mr. Walton Newbold: I think not. I think that it just dropped, and has been resurrected later. 785. *Sir Philip Gibbs*: In answer to a question, you admitted that there had been a certain amount of co-operation in the case of Shearer, and that he had at least endeavoured to stir up trouble and to prevent a reasonable disarmament, on behalf of the Bethlehem Steel Trust, and then you went on to say that there will always be people like that. Now, would you agree that under a system of the private manufacture and trade in arms, there are likely to be a good many people like that?

Mr. Walton Newbold: No, I do not think that there are a great number of people like that.

786. *Sir Philip Gibbs*: You think they are limited, possibly, to one or two?

Mr. Walton Newbold: I have never been able to make up my mind whether Shearer was an agent or a blackmailer.

787. *Sir Philip Gibbs*: Well, it has been proved in public evidence that he received very high pay for his services by the American Steel Trust?

Mr. Walton Newbold: Well, possibly. It is quite likely. I think he did. I am not sure that it has been proved that the payments were made to him. I know it has been proved that he says that he was engaged by them.

788. *Sir Philip Gibbs*: It has been definitely proved that the payments were made, and he sued them for extra payments. That is a matter of public knowledge.

Mr. Walton Newbold: Well, it is quite possible that you may sue somebody but not get the money.

789. *Sir Philip Gibbs*: For extra payments.

Mr. Walton Newbold: The American legal procedure is such that I would not like personally to attach too much importance to the whole case. I have not explored Shearer, because Shearer was connected with a group of interests in America, and the whole thing was a matter of rivalry, of vested interests, as most of this is. The metal people attack the arms people and the arms people attack the metal people, and all the critics of the arms trade that I have come across deliberately, or else in ignorance, suppress the facts regarding anybody but the finishing end of the trade, and I have begun to wonder whether they are disinterested people at all.

790. *Sir Philip Gibbs*: Now, may I ask you if you have read the American evidence of the Nye Committee, as it is called?

Mr. Walton Newbold: I have read the evidence in so far as it has appeared in this country. I have not read it in detail, because I have not been able to get a full text.

791. *Sir Philip Gibbs*: Have you read sufficiently to make up your mind at all as to the evidence of bribery?

Mr. Walton Newbold: No. I think that the evidence, as it has appeared in this country, is so truncated that until I am able to get the whole of the evidence and read it for myself, I would rather not arrive at any definite conclusion.

792. *Sir Philip Gibbs*: I think that is very wise on your part, I must say. Now, excuse me for asking you a series of rather rapid questions, will you? I want to cover a fairly wide field. You say that in dealing with certain interests of the manufacturers, as far as your inquiries went, you could not find very much in the nature of a ring; you found that these arms firms were competing against each other—Vickers against Armstrongs, and so on; but do you think there is, at the present time, nothing in the nature of an armaments ring?

Mr. Walton Newbold: I have not expressed an opinion.

793. *Sir Philip Gibbs*: No. I am asking you that question.

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

Mr. Walton Newbold: Yes.

794. Sir Philip Gibbs: What was the answer to that question?

Mr. Walton Newbold: My answer to that question is that I think probably the authorities preferred the closest collaboration in technique, in technical matters, between firms in certain lines of armament manufacture, but I have not found that there is any great tendency to combination in the aeronautical end of the industry.

795. Sir Philip Gibbs: That is perhaps as far as you know.

Mr. Walton Newbold: I do not think there has been anything like as much as there ought to be. Personally, I should like to see it much more closely concentrated and centralised than it is at the present time, because I think that they were lagging behind most terribly in every direction.

796. Sir Philip Gibbs: One of the witnesses before the McKinnon Wood Committee which inquired into the Woolwich industry—it was Colonel Dennis, who was the Director of Gun Factories—stated in his evidence that owing to a ring among the steel manufacturers of this country, it was impossible for Woolwich to control prices. Would you agree with that at all?

Mr. Walton Newbold: I think it would be impossible for Woolwich to control prices for the very high grade steels at that time. I think probably it would be impossible at the present time.

797. Sir Philip Gibbs: To control prices?

Mr. Walton Newbold: For the very high grade material. I am only speaking of the very high grade material.

798. Sir Philip Gibbs: Yes; you mean to say that there is still a difficulty in controlling prices?

Mr. Walton Newbold: Gun steel is of a very high quality of material indeed. It is quite different from other lines of the business. I think that is so. Mind you, I cannot prove it.

799. Sir Philip Gibbs: Now about this question of a ring, have you any knowledge at all as to the ramifications of a firm like Vickers-Armstrong?

Mr. Walton Newbold: Yes, I think I have.

800. Sir Philip Gibbs: You must admit that they are far-reaching.

Mr. Walton Newbold: I think that they are very far-reaching indeed, but I think that generally the ramifications tend to be in the finance. For instance, you will find that Vickers, Ltd., for the most part is only a holding company, though it does keep certain branches of the business for itself. You will find that the Armstrong-Whitworth Company to-day, Sir W. G. Armstrong-Whitworth & Company, is outside the armament business altogether, having sold its business, through various gradations of companies, to Vickers-Armstrong; but I believe it has material interests as a holding company. It is not an operating company, it is a holding company in armaments, and an operating company outside of armaments. I think that you will find great difficulty in understanding the lines of demarcation in ownership in operating and holding companies, and probably in finding, if you went inside the works, where one business begins and another business ends. I used to think, myself, that this was due to deliberate chicanery, but I think it is inherent in the nature of the industry.

801. Sir Philip Gibbs: Would you agree that there is a very close international co-operation among the arms firms of Europe?

Mr. Walton Newbold: Yes, I think it is true. It is all determined by public policy. I think that if a country has allies and associates, then naturally there are those contacts.

802. Sir Philip Gibbs: You would not say that there are associations of firms between countries who have tended to be hostile to each other historically?

Mr. Walton Newbold: I think there have been apparent cases of that, because I believe that before the War, both Germany and Britain were trying hard to draw Turkey away from the other, and I

think they were trying to draw Greece to one side or to the other. They were trying to draw Italy to one side or to the other. Now, I do not think it will matter whether you blame the arms firms or approve the arms firms. After all, if the Foreign Office says it considers it desirable that a certain power shall be armed or disarmed, shall be made an ally or forced to be an enemy, then the contractors, as agents to the government, ought to do what the government wishes them to do, or else refuse to handle the trade. It is a matter of public policy, not a matter that concerns the contractor. He is an agent.

803. Sir Philip Gibbs: I suppose you would admit, though, that in the private traffic in arms, these manufacturers do export arms as much as they can to foreign countries?

Mr. Walton Newbold: Yes, but I think it is a fact that they never export such material without having a licence from the Board of Trade, and I believe an authorisation from the Foreign Office has to go with it that it is not undesirable that it should go. I do not think they engage in any smuggling, for instance.

804. Sir Philip Gibbs: And you do not think that with their international associations, if they are refused a licence in this country they could provide the country ordering arms through one of their subsidiary companies in a foreign nation?

Mr. Walton Newbold: Well, take the case of Paraguay and Bolivia. I have very carefully investigated to find whether, since the outbreak of hostilities, either the British or the French firms have engaged in it. I am satisfied that they have not. What I am not satisfied is as to who may be the owners of the Belgian works that have sent material to the combatants. I am not satisfied as to the identity, nor have I been able to discover the identity of the American firms that have been sending material, or that it has been alleged may have been sending it. It is quite possible that those Belgian firms may be under French influence, it may be that they are under German influence, it may be that they are under British influence, but I think it is much more probable that they are *bona fide* Belgian concerns. But, mind you, I have no particulars about it, and therefore I prefer not to say either yes or no.

805. Sir Philip Gibbs: I would just like to refer for a second to the case of M. de Wendel. You seem to have a considerable knowledge of that. Am I absolutely wrong in thinking that the Wendel family is very much distributed on both sides of the French and German frontier?

Mr. Walton Newbold: You are perfectly correct. That frontier has been in dispute for 300 or 400 years. The mines and the iron works there are older than those of Merthyr Tydfil. They go back to as far as the period of the Weald. They have sometimes been on the one side of the frontier and sometimes upon the other. The de Wendels have had to operate under Germany, they have had to operate under France, and I do not think anyone has ever suggested that they made either the Franco-German War or the Great War. They were simply the victims; but the de Wendels are not makers of armaments.

806. Sir Philip Gibbs: No, but they make the steel, of course.

Mr. Walton Newbold: They make the steel and they make mainly a steel that is no use in the manufacture of guns.

807. Sir Philip Gibbs: You say: "I take this opportunity of correcting a bias against truth."

Mr. Walton Newbold: Yes.

808. Sir Philip Gibbs: And as a matter of fact a considerable part of your statement is a denial really of a good deal of your life's work, is it not?

Mr. Walton Newbold: Exactly. I am never afraid when I have found facts to be insufficient.

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

809. *Sir Philip Gibbs*: I think you are very brave in taking that position, and in saying so quite frankly.

Mr. Walton Newbold: I feel that I am responsible, because this pamphlet, *The War Trust Exposed*, was published in 1913, and *How Asquith helped the Armour Ring* in 1914. The next one that I published was published under the Defence of the Realm Act, and great parts of my material had to be left out because the book would simply have been suppressed at once, even if I had put the material in; and I do know this, that if you start with a bias against anything, especially when you are young and enthusiastic, you find what you want to find. As you grow older, you are compelled to recognise that your first enthusiasms do not justify you in this selection of facts. Now, I do object, as an economic historian, to the selection of facts to prove a case. I am primarily a historian. I am more interested in history than I am in any other subject, and I absolutely refuse to prostitute history to propaganda.

810. *Sir Philip Gibbs*: Now, you say that there was a renewal of propaganda in 1928 against the arms manufacturers and against people like Vickers Armstrong and so on, and you suggest that really there is a Communist influence behind this, that it is an attack really directed by Communist sentiment, and so on, do you not?

Mr. Walton Newbold: I think that there are three lots of influence, and I think that the most aggressive is certainly Communist and semi-Communist.

811. *Sir Philip Gibbs*: Well, how do you reconcile the fact that there is a considerable amount of uneasiness in the minds of people like Lord Davies and Lord Cecil, and other very highly respected people who cannot be accused or suspected of being under Communist influence?

Mr. Walton Newbold: Well, I do not for a moment suppose that those two gentlemen are, but I think they are mistaken enthusiasts without first-hand information as to the facts, and the fact that they are peers of the realm does not in the least degree suggest to me that they are worthy of any more attention than ordinary human beings.

812. *Sir Philip Gibbs*: No; but it would rather tend to suggest that they were not tainted with any Communist philosophy?

Mr. Walton Newbold: If you will notice, I very definitely state in the first part of my memorandum that I refer to *bona fide* pacifists, amongst which I include Mr. Arnold-Forster. Mr. Noel Baker might be included, and Lord Cecil, but I hold that the other people are not *bona fide* pacifists, because they certainly believe in fighting, both internationally and within the country; but they all run together like a herd.

813. *Sir Philip Gibbs*: You make use of a phrase in which you say, "Were I appearing here as the representative spokesman of the Society of Friends" you would be bound to support, perhaps, a unilateral programme; but may I suggest to you that having changed your opinions with regard to your war books, you seem also to have changed your opinions with regard to the Society of Friends?

Mr. Walton Newbold: As a Quaker, certainly, I would be prepared to disarm, but I think that the country has definitely made up its mind that it is not going to disarm, and therefore I have to consider whether I am accepting the will of the majority or going forward with my own personal opinion. If I go forward with my own personal opinion, then I hold that I am not accepting the will of the majority. I must choose one or the other, and I say quite frankly that if it comes to that I stand by the will of the country as a whole.

814. *Sir Philip Gibbs*: I have only one more question, and that is that in your final paragraph in which you sum up the whole case you seem to accept, to my great distress, as an axiom that we are going to have another very terrible war, and that, therefore, it is necessary to increase all our factories even as far as the Welsh valleys and the Scottish glens.

Now, do you feel that you are sufficiently provided with evidence on that subject to—?

Mr. Walton Newbold: Well, I feel there that my country has pledged itself—

815. *Chairman*: I think we had better not go into that, Mr. Newbold.

Mr. Walton Newbold: I am entirely in your hands.

816. *Chairman*: I mean, it may be your opinion, but still, we hope it is an inaccurate one; that is all I can say.

Mr. Walton Newbold: Only history can prove which of us is correct.

817. *Sir Thomas Allen*: Reverting to the first question put to you by Sir Philip, while you are concerned to remove the causes of war you are also convinced that while wars are probable and possible we should have the most efficient and effective services at the national disposal to ensure our defence and security?

Mr. Walton Newbold: Yes.

818. *Sir Thomas Allen*: Reading your evidence, and listening to the replies, more particularly the reply you gave to Mr. Spender this morning, I am rather exercised in my own mind at the moment as to whether you favour the abolition of private manufacture and full state manufacture, or are you in favour of the continuance of both systems?

Mr. Walton Newbold: There I feel that it would be better to let the private industry atrophy rather than deliberately to abolish it. It all depends how far the country is prepared to face up to the implications of collective security. If we are going to face up to the implications of collective security, then I think we should go whole-hog into it; but I do not think the country will do. Personally I regret the principle of having to go and fight for the League of Nations; I think it is wrong; but the country has decided in favour of it.

819. *Sir Thomas Allen*: Your study of armaments spreads over a very long period of years. Could you tell us what opportunities you have had on your visits to the various factories, both at home and in the United States and in Europe, of studying the armament business from a sales point of view as distinct from manufacture?

Mr. Walton Newbold: I have not looked at the sales side at all in so far as I have visited the factories, but I have had other sources of material which I will be prepared to hand in in writing to the Commission.

820. *Professor Gutteridge*: The main questions I wanted to put to you have already been put by Mr. Spender, but I think in fairness to you I should like to call your attention to an inconsistency in your evidence here. Have you got your evidence in front of you?

Mr. Walton Newbold: Yes.

821. *Professor Gutteridge*: Will you look at the tenth paragraph: "I have investigated the economic activities of M. François de Wendel both in Lorraine and in Paris. I have done the same in the case of M. de Peyerimhoff. M. François de Wendel has never made a gun in his life. His firm has never made a gun. It would be as reasonable to charge Sir Andrew Duncan or Sir William Larke of the British Iron and Steel Federation with being interested in the arms trade as to charge M. François de Wendel." You are saying there that it is not fair to attack M. de Wendel because he is not an armament maker?

Mr. Walton Newbold: It is not fair to deal with him as an armament maker.

822. *Professor Gutteridge*: Now will you turn to the later paragraph in which you say: "I submit to you that there is a profit to be made out of arms supply not only—or, for the reasons already indicated earlier in this memorandum, so much—at the finishing end of the manufacture as by those who are engaged in the buying and selling of the metals."

Mr. Walton Newbold: Exactly.

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

823. *Professor Gutteridge*: Well, how do you reconcile those two statements?

Mr. Walton Newbold: I am dealing with a pamphlet which does not deal with the buying end of the business at all, but only deals with the finishing end of the business, and the point that I am trying to make out through my whole evidence is that the critics of the arms trade in one large group to which Mr. Noel Baker belongs always regard as armaments only the finishing end of the business, and I have tried throughout the whole of this memorandum to point out that there are four profits in armaments, four potential profits.

824. *Professor Gutteridge*: Would you mind enumerating them?

Mr. Walton Newbold: Yes. The finishing end, the supply of the metal and chemical bases, the machine tool supply, with which one might put general contracting as well—erection of works, and so on—and there is also the element of the actual labour involved, both by hand and by brain. Those are the four interests that I would name; but the pamphlet with which I was dealing only refers to one specific interest, and it does convey the suggestion to the reader that M. de Wendel is engaged in arms manufacture, but he is not engaged in arms manufacture and it is characteristic of the loose thinking and general loose talking of these people to suggest that he is in the arms trade at all. De Peyerinhoff is in coal, not in steel, much less arms and engineering. Armaments is engineering and chemistry.

825. *Professor Gutteridge*: Do you stop at the fourth category? What about the man that makes the boots for the soldiers, their uniforms?

Mr. Walton Newbold: If you like to go as far as that, of course. You cannot contract out of the system, but that is not within the definition of the arms trade as I have ever seen it interpreted.

826. *Professor Gutteridge*: Do you think there is any precise definition of the arms trade? That is the point I am putting to you.

Mr. Walton Newbold: No, absolutely none.

827. *Chairman*: I have been asked to put some questions to you, and I will read them to you. The first is this: Would the witness give any information as to whether there is any international ring to-day either of armament manufacturers or of firms producing the essential materials for armament construction? Is there any international ring, the inquirer wishes to know.

Mr. Walton Newbold: I would say that there is no world ring. I would say that there are certainly signs of local rings. I know that in the case of Vickers they have an interest in Spain. They have certain holdings. How deep I have not been able to find. You will probably be able to elicit; I cannot. They have certain holdings in Japan, I believe, but I am not certain; but you have not anything like a global ring of the arms manufacturers. You have Schneider in certain countries, you have Krupp in certain other countries, and I have no doubt that many of these firms—and I think it is more true of dictatorships than it is of democracies—may have ramifications of which we do not know, and which you will find exceedingly difficult to discover. I know I often find something that I assume is probable worthy evidence of the existence of one, but if you asked me what my opinion was I do not think I would like to give it here, because I am still working on it. I do not think it would be accurate information. Now, if you come to the metal trusts, I think there is much more evidence there of an all-in metal trust, and I think that there are many market arrangements in the metal market; but there again you will have to receive evidence from somebody who knows not only the theory but the practice of the metal trade, and if I might recommend it, I would recommend that you should try to find that out. I think that there is some indication of arrangement between Du Pont, the Imperial

Chemical Industries, the Kuhlmann in France. I do not know how far the I. G. Farben-industrie is still in such arrangements. I think it would be worth while exploring that, but I cannot say out of my own knowledge that such and such a thing is true. It used to be true before the war, but whether it has ever been true since the war I would not like to say. 828. *Chairman*: The next question is this: Would the witness agree that nickel and high speed alloys, haematite iron ore, silica firebricks, constitute the main raw materials or intermediates for the construction of armaments still? Can the witness give any information as to who controls these raw materials in the British Empire?

Mr. Walton Newbold: I would not like to give any off-hand statement on that subject, but I think it is true to say that you have got about 40 per cent. of them there. I think there are many more, but there again it would be better—

829. *Chairman*: 40 per cent. of them?

Mr. Walton Newbold: 40 per cent. of the different categories. I do not think that that is by any means wide enough.

830. *Chairman*: Now, the next is this: Would the witness agree that there is great technical improvement in machines for making armaments, and that, say, since 1914 all or most of the machines and machine tools have been improved and replaced?

Mr. Walton Newbold: I would be willing to say that since 1914 in most of the arms factories there has been very considerable replacement. As a matter of fact, it would be perhaps from 40 to 60 per cent. I think that there is still a lot of old plant of pre-1914, or rather I would say of pre-1915, because there was not very much change, I understand, up to 1915. I think that Dr. Addison has got hold of the right end of the stick, but I think one must say that to-day the British machine tool manufacturers are in a position to supply the needs. There is an association, but I am rather of the opinion that though there is an association it does not operate so much as a ring as some members of it would like it to do. That is the information I have received. I have tried hard to find out the position in the machine tool business, because it is rather alarming to go through certain factories—

831. *Chairman*: I think you are really going beyond what the inquirer wanted to know. I think the question is confined to the point as to whether there has been great technical improvement in machines since that date. You agree that?

Mr. Walton Newbold: Oh, yes, great technical improvement.

832. *Chairman*: Then the fourth question is: Can the witness state how many arms firms have their works at Coventry at the present time, and what is the percentage of armament production there? Does the witness in his statement refer to the machinery for making tools in Coventry?

Mr. Walton Newbold: I refer to the machinery for making tools. I refer to the machinery at present engaged in the manufacture of aeroplane engines, which may be for war or for other purposes. I refer to the machinery that is available there for the making, if need be very quickly, of armoured cars, for the production very quickly of machine guns, which are very closely akin in their home land, and their home works, to the manufacture of machines and of sewing-machines—the machine tool and the sewing-machine moving together across many years. 833. *Dame Rachel Crowdy*: If I understood you rightly, you said that you had no knowledge of illicit exports of arms from this country to other countries did you not?

Mr. Walton Newbold: Yes.

834. *Dame Rachel Crowdy*: Have you by any chance in your very wide experience come across anything in the nature of exports of parts to other countries where they may be assembled? I mean practically completed parts, and I am thinking particularly of countries to which export from British firms at a given moment is not advisable?

20 June, 1935.]

Mr. J. T. WALTON NEWBOLD, M.A.

[Continued.]

Mr. Walton Newbold: Well, there again it is a matter of definition as to where it is advisable.

835. *Dame Rachel Crowdy*: I mean in a case where there is an embargo or order by government, or where a very strong line taken at Geneva by the British Government delegates would imply that we in our country could not export arms to country X?

Mr. Walton Newbold: I do not think I could say that I have found such evidence. I think it is probable that parts are sent out that, when they arrive in a foreign country, might be for commercial use or might be for arms use, but I could not say that I have seen evidence of it going on as a deliberate thing.

836. *Dame Rachel Crowdy*: I mean definitely to evade regulations, to keep within the letter of the law but not within the spirit of the law?

Mr. Walton Newbold: I think that to-day, when there is so much nosing round to find out cases of that sort, that the big firms would be very unwilling to do it. Now, what I do know is going on is that there are a certain number of what you might call free traders at work, people who

(The Witness withdrew.)

Mr. ARCHIBALD FENNER BROCKWAY, representing the

840. *Chairman*: Mr. Fenner Brockway, I understand that you are prepared to submit evidence on behalf of the Independent Labour Party?

Mr. Fenner Brockway: That is so.

841. *Chairman*: Then I will ask you first of all who prepared this statement? Did you prepare it yourself?

Mr. Fenner Brockway: The statement was prepared by myself. I was asked to do it because I had made some study of the subject.

842. *Chairman*: Has it been submitted to any body representing your Party, or have you been merely instructed to do it on their behalf?

Mr. Fenner Brockway: I have been instructed to do it on their behalf, but it has been endorsed by the Executive of our Party.

843. *Chairman*: How would you prefer to deal with the matter? Would you like to read the evidence, or would you like to go through it and make comments as you want, without reading the whole of it?

Mr. Fenner Brockway: The evidence is rather long, and I appreciate that it covers some points with which you have already dealt. I would be prepared, if you should agree, to adopt the course of summarising it and drawing attention to particular points.

844. *Chairman*: It does not mean a long speech on each point?

Mr. Fenner Brockway: I think it would be shorter than reading the whole document.

845. *Chairman*: I do not want to stop you.

Mr. Fenner Brockway: We make, in this evidence, a series of charges against the British armament firms. We charge them with fomenting war scares, with persuading their governments to pursue warlike policies in order to increase orders for armaments. We charge them with bribing government officials. We draw attention to the fact that they appoint government officials, after retirement, to good positions on their directorates. We charge them with disseminating false reports concerning the military and naval programmes of other countries in order to stimulate orders. We charge them with belonging to organised international rings and trusts to play off one country against another in order to force up prices. We charge them with having produced war materials for other countries which in time of war have been used against the British armies. We charge them with prolonging wars by supplying materials to both sides. We charge them with having provided war materials to governments engaged in war, even when the war has been condemned as an act of aggression by the

are buying and selling aeroplanes and who are trading these in Latin-America and elsewhere. I constantly hear of cases, but I cannot put my finger right down upon them and say, "So-and-so is doing it."

837. *Dame Rachel Crowdy*: Foreign middlemen, you mean, buying from British firms?

Mr. Walton Newbold: Not only foreigners. I think there are some Britishers doing it.

838. *Dame Rachel Crowdy*: In foreign countries?

Mr. Walton Newbold: Doing it in foreign countries, yes. I heard of a case the other day, but I am sorry I have not his name, and I think in the circumstances in which it was told me I should not be justified in disclosing it; but I think it is a matter you should explore. I think that that is going on rather widely, but it is not, I believe, done by the manufacturers so much as by what you might honestly and properly call traders in war material; but then, they would trade in anything. It is not specifically a war trade.

839. *Chairman*: We are much obliged to you, Mr. Newbold. I think that completes the examination.

Independent Labour Party, called and examined.

League of Nations, and we particularise the cases of Paraguay in South America and Japan in the Far East. We charge them with having provided war materials to the Chiang Kai Shek Government in China for its war against the Chinese Soviet Republic. We charge them with having solicited orders in Germany in violation of the terms of the Versailles Treaty, and of having recently supplied Germany with aeroplane engines.

Having made those charges, and given in each instance some evidence to support them, we say that this type of activity is a menace to the peace of the world, and that it ought not to be tolerated by governments, it ought not to be tolerated by peace-loving peoples.

But we want to emphasise the point that in engaging in activities of this kind, the armament firms are pursuing the ordinary methods of business. We do not regard armament firms as being particularly wicked; they are exactly as other profit-making concerns. They must sell goods; they must secure markets. In this case, the markets depend upon international tension and national rivalries. They must create those conditions, and we emphasise the point that, so long as the armaments industry is run for profit, as a profit-making concern, those dangers will continue.

We want, however—and I draw your attention to paragraph 8—to emphasise the distinction between armament firms and ordinary industry. We say in that paragraph:

"The armaments industry . . . is engaged in the production of goods for the purpose of death. Those goods are the most efficient which enable the most human beings to be killed with the greatest ease. The success of salesmanship and publicity is measured by the extent to which these death-dealing goods are spread over the world. The conditions to be created for good business prospects are international tension, circumstances threatening war, and the intensification and prolongation of war when it occurs. The purchasers of the goods may be enemy governments which will use them to decimate the fellow-citizens of the armament-makers. The rings and trusts may be used, to quote the League report, "to play off one country against another" in armaments rivalry and to hold governments up to ransom by extorting higher prices. These differences naturally invite the question whether the community should permit this industry to remain on a profit-making basis and in its search for markets to encourage conditions endangering peace."

20 June, 1935.]

MR. FENNER BROOKWAY.

[Continued.]

and we give the answer at once, that the community ought not to permit that. We submit that it is urgently necessary to end the motive of profit-making in all war preparations.

Then, Sir, we go on to point out that there are certain difficulties in applying that principle, which may generally be recognised as admirable. In the first place, the war industries are also peace industries. The firms which are producing war materials are quite extensively producing peace materials and, secondly, many peace industries are potential war industries. Certain of them, like the Imperial Chemical Industries, are mostly engaged in producing articles of peace, but also have a side to their activities which is the production of chemicals for war. Secondly, we point out that the arms industries are very closely linked with other industries. In paragraph 11, we instance Vickers, which is associated with electrical, rubber, steel, iron and coal companies, and we specially emphasise their very close connection with the banks. Thirdly, we point out that the British armament firms have very extensive international connections. If one takes Vickers, we list in paragraph 4 its associated companies, not only in the British Empire, Canada, Ireland, New Zealand and India, but in Spain, Italy, Rumania, Holland, Poland, France, Japan and South America. In the case of the Imperial Chemical Industries, we show in paragraph 12 that it has twenty-one foreign alliances.

I think it is just worth pointing out, Sir, that we were all shocked last week by the disaster in a munitions factory in Germany. We were shocked not merely by the loss of life. We were alarmed by the amount of war preparations which it indicated. That German firm, the Westphalian Anhalt firm, is one of the foreign allies of Imperial Chemical Industries in this country. We find it listed in the document to which I draw attention, Exhibit 461 in the Proceedings of the American Arms Inquiry. The Imperial Chemical Industries has twenty-one such foreign alliances, 8 in Belgium, 5 in France, 3 in Germany, 2 in Italy and 1 each in Norway, South Africa and Switzerland. It has, in addition, foreign investments in 30 companies: in the U.S.A. 6, Belgium 3, Australia 3; 2 each in France, Czechoslovakia, Germany and South Africa; and one each in Austria, Spain, Hungary, Canada, Rumania, Argentina, Chile, China, India, and Japan. We point out that therefore it is not a simple matter of just nationalising an industry in Britain: there is the very difficult problem of all these international connections and we stress the point that it is very difficult to separate the war industries from other industries. The war industries are embedded as a part of our whole economic system. We adopt the phrase that the economic structure of capitalism is one and indivisible.

Having stated that, we turn to the remedies which that brief survey would indicate as necessary. We suggest that nationalisation of peace industries is a good phrase, but in itself does not get us very much further. We have to ask which industries are to be nationalised, we have to ask what about the industries under British control which are abroad; and in particular, Sir, I would like to draw your attention to paragraph 13, in which I think we do make a new point about the danger of pursuing a policy of nationalisation alone:

"It is clear that a proposal to nationalise war material industries within Britain would not be enough. Recommendations to be effective must also deal with the participation of British concerns in the war industries abroad. Even if an international rule were adopted, say, on the initiative of the League of Nations, that industries engaged in the production of war materials should be nationalised in all countries, the problem would not be solved. The difference in the case of the small nations would, under present conditions, be more apparent than real. The governments of such nations would only be able to nationalise

their war industries by raising international loans. Such loans would be floated in London, Paris, New York and other financial centres. The financiers behind these loans, and the governments supporting them, would in fact be the owners of such industries.

This opens up dangerous prospects of small nations being used as the pawns of the big powers, which would naturally utilise their economic resources to win prospective allies. A new form of Economic Imperialism would be developed in which the governments of the big powers would be directly involved in maintaining the efficiency of the nationalised war industries of their smaller allies. It would obviously be in the interests of the associated 'nationalised' industries to exchange information regarding new processes and new destructive instruments and chemicals. Rivalries would probably develop between the different groups of big powers and satellite nations. Political alliances would be supplemented by war-industry alliances. This is not a reassuring prospect. Any remedies to be effective must clearly deal with the question of international loans for war industries."

We therefore proceed to make a series of very drastic recommendations, more drastic, I think, Sir, than any that have yet been brought to your notice. I would say that unless recommendations of this character are carried out, it is impossible to remove the profit-making motive from the war industries; and these recommendations apply, not merely to the nationalisation of British industry, but to the problems which I have indicated in the relations of British industries abroad. First we suggest that:

"(a) All establishments in Britain—factories, mills, workshops, laboratories, etc.—which are primarily devoted to the production of war materials shall be nationalised, and shall be placed under a Minister directly responsible to Parliament. A workers' council, representing all grades of workers employed, shall be responsible for the control of the working conditions in these establishments. (b) All British concerns owning establishments abroad which are used for the production of war materials shall transform them by a given date into establishments for the production of peace goods, or else disband them. (c) All British concerns which have arrangements with companies abroad for the production or sale of war materials shall end them by a given date. (d) It shall be made illegal for any British citizen after a given date to own or to hold shares in any industry, either at home or abroad, which is primarily devoted to the production of war materials. (e) If orders for war materials are given by the government to any concern not state-owned, the work shall be done on a costings basis without profit. (f) The export from Britain of materials for war purposes shall be absolutely prohibited. (g) No British firm, bank, or individual shall participate in loans for the purpose of the production, transport, or sale of war materials in any part of the world. (h) It shall be a criminal offence for any British citizen to solicit for orders for war materials or, on behalf of any firm, to attempt to exert influence against any proposals which may bring about a reduction of such orders. (i) Committees of workers shall be appointed in all establishments concerned at any time in the production of war materials to assist in ensuring that these regulations are carried out. A national committee representative of the workers' organisations shall be appointed for a similar purpose. (j) The British Government, having adopted these methods to eliminate profit-making from war preparations, shall do its utmost to get them adopted internationally."

We agree that those are drastic proposals; but we see no other method by which the profit motive is to be taken out of the war industry; and while it remains in the war industry, we believe the war industry will be dangerous to peace. I think, Sir,

20 June, 1935.]

Mr. FENNER BROCKWAY.

[Continued.]

that that is a summary of the evidence which we bring before you.

846. *Chairman*: I do not quite follow the reasoning in paragraph 13, because—take the present conditions—the small governments have to buy their arms, and in order to buy their arms they have to raise a loan. Then I do not see what difference it makes. You say that, given nationalisation, they will have to raise a loan, and therefore nationalisation is perhaps desirable; but the condition of things so far as raising a loan is concerned is the same whether nationalisation is adopted or not, is it not?

Mr. Fenner Brockway: I should submit this, Sir, that at present the small nations have two methods by which they secure arms: either they order from an armaments firm in Great Britain, Schneider in France or Skoda in Czechoslovakia, or else one of those big armament firms has works actually in the territory of the small nation. That quite frequently happens. That is the present method. It is undoubtedly true that they very often have to raise loans for the purchase of armaments. Those loans are now frequently raised in connection with the armaments firm which is supplying the order. In France, more than in this country, the armament firms have their own banks which make the loans, and the loans having been made by their own bank, they get the order. I have no evidence that this is the case in this country, but the armaments firms take the initiative in trying to raise the loans. The American evidence shows cases of that with Vickers. Vickers were asked to raise a loan by the Electric Boat Company in America. Vickers replied that they could raise a loan for the purpose of an order in this country, but they could not very well raise a loan for the purpose of orders in America. Now, the loan in these cases is made through the armaments industries. If you have your armament industries nationalised under government control, the initiative in the loan, the support of the loan, the backing of the loan, will be more closely a matter of governments, and therefore governments are likely to have a control of the small nations to a greater degree than at present. That is the point I was trying to make.

847. *Chairman*: Now I will go back to the beginning of your statement, if I may, and ask one or two questions about what appears there. You have formulated a number of charges and these charges, I understand, relate to what may generally be called abuses.

Mr. Fenner Brockway: Yes.

848. *Chairman*: Now take Mr. Mulliner's case. I am troubled about poor Mr. Mulliner, because I do not quite see that both sides of the question have been considered. Of course, if Mr. Mulliner honestly believed what he said, it was a misfortune that he went and reported it; it was not an abuse. Has anybody ever tried to find out whether Mr. Mulliner did believe what he said, or whether he was inventing? Of course, if he was inventing, I agree it was an abuse, but if he honestly believed it, you might say he was a mistaken patriot?

Mr. Fenner Brockway: Yes, it is a little difficult to read men's minds in that way.

849. *Chairman*: Then I do not know that you ought to accept it as an abuse until you have settled that question?

Mr. Fenner Brockway: Except that I would put this further point, that Mr. Mulliner was very disappointed when his own firm did not get any of the orders that were given, and we should not have known anything about this if it had not been for Mr. Mulliner's own letters in *The Times*, which told the story; and I will only say that those letters in *The Times* do at least suggest that this was being quite deliberately done for the purpose of getting orders. I will not put it more strongly than that; I cannot.

850. *Chairman*: I mean, it was deliberately done, no doubt, because he went intentionally. However, I will not go into it any further, as nobody has

inquired into it. Now, the question about the admiral in Japan, again that, from our point of view, of course, is an abuse; any bribery is an abuse, of course; but from the point of view of prevention of war or encouraging war feelings and preparations, there is a great difference, is there not, between a case where an order was created as a result of a bribe, and where an order, having been advertised, there is great competition between different firms to get the order, and then a bribe is given to secure the order to one company rather than to another. This latter form of bribery does not increase the amount of effective armament.

Mr. Fenner Brockway: No, but I would suggest this, Sir, that if relations develop between officers of an armament firm and the officials of a government department which enable bribes to pass between them, you have a relationship there which is not likely to end there, and which may easily mean that the officials of a government department, having had those relationships with an armaments firm, will encourage the giving of orders or the getting of orders. I think that is very likely from that relationship.

851. *Chairman*: In paragraph 4 you refer to the relation of bribery to what you call a subtle method. It is not bribery, but it is a subtle method. Now, is "subtle" quite the right word? I understand "subtle" to be something that you take trouble to conceal; I do not know whether you accept that view of the expression; but whatever is done is done quite openly in this matter, is it not?

Mr. Fenner Brockway: Well, the appointment of government officials who have been responsible for giving orders from their departments to the directorate of the armament firms—that is open. What is not open is what may have preceded that.

852. *Chairman*: Yes; but that is a guess?

Mr. Fenner Brockway: Well, it is not quite a guess. I mean, I want to suggest first to you, Sir, that this thing is obviously not desirable.

853. *Chairman*: Oh, that is another question altogether.

Mr. Fenner Brockway: That it is open to abuse.

854. *Chairman*: Oh, that is a fair argument, if you like.

Mr. Fenner Brockway: And I must draw your attention to the letters of Sir Charles Craven which were given as exhibits in the American Arms Inquiry. Sir Charles Craven, a very responsible official of Vickers, indicates in those letters that he has certain friends in government departments. He indicates that those friends try to get Vickers orders. He indicates that they provide him with confidential information regarding the prices put in by other competitive firms.

855. *Chairman*: Yes; but those persons whom you are referring to at the moment, if they exist, are actually people in government employ, not people who have left the employ and gone into the armament business?

Mr. Fenner Brockway: No; but obviously I cannot put it more strongly than this—I will put it like this—that it would be very possible for an armament firm to say to an official in a government department who was responsible for giving orders, "You can understand that when you leave your position in the government at such an age, a directorate or an official position will be open to you in our firm." I say that is a possibility.

856. *Chairman*: A pure assumption.

Mr. Fenner Brockway: Well, may I read this extract from a letter of Sir Charles Craven?

857. *Chairman*: Yes.

Mr. Fenner Brockway: It is Exhibit No. 18 in the American Arms Inquiry. It is a letter to the Electric Boat Company, which are the American allies of Vickers for the manufacture and sale of submarines. Sir Charles Craven says in this letter: "I also think that perhaps it would be worth while putting forward a tender for six boats"—that is a

20 June, 1935.]

Mr. FENNER BROCKWAY.

[Continued.]

tender for six submarines for the British government—"the total number to be built. I had a word with the Director of Contracts at the Admiralty, who is a friend of mine, and who would like this. He, I know, tried to get us the order for all five submarines last year." I take one other quotation, from Exhibit 19, a letter from Sir Charles Craven again to the Electric Boat Company of America: "I have been able to obtain the enclosed information from an absolutely reliable but very secret source. The only three tenders receiving serious consideration are Vickers', Beardmore's and Cammell Laird's, and we were the only firm who tendered for more than three boats. The attached statement shows the state of affairs in the order of cheapness from the Government's point of view. I do know that one of the important Admiralty departments is recommending that Vickers should have four and Cammell Lairds two, and it would therefore appear that we stand a good chance of at any rate three or four boats." Now, I am going to suggest to you, Sir, that that indicates that Sir Charles Craven has secret sources of information from inside the Admiralty, and that that is a very dangerous relationship.

858. *Chairman*: Now, in paragraph 4, there is a question I want to ask about head (f). I do not quite follow this. This is a complaint and a charge: "Armament firms have organised international armament trusts, which have increased the price of armaments to governments." Well, by that you mean not only our own Government but all governments to whom the goods are supplied; is that so?

Mr. Fenner Brockway: Yes.

859. *Chairman*: Well, from the point of view of encouraging warlike aims or feelings, the dearer the goods are the less likely they are to be sold, are they not?

Mr. Fenner Brockway: Unfortunately governments will spend on war preparations almost whatever the cost; I mean, they will economise, when it is a matter of health, housing, unemployment benefit; but when you get the psychology of war panic, they will spend limitlessly, and I doubt whether the raising of prices is a very big factor.

860. *Chairman*: I should have thought that the cheaper the goods from this point of view the more dangerous the operation; but still, you do not take that view?

Mr. Fenner Brockway: I should have said that when it is a monopoly, when you have a government as the purchaser, and that government can rely upon all the wealth of its community and create a scare about a war danger, they will not care very much about the price they have to pay. I could give evidence to support that if you desire to have it.

861. *Chairman*: Oh, I do not doubt that. No, I do not think there is anything else I want to ask. I quite follow your recommendations, but it is quite obvious that with the best intentions there would be some difficulty in carrying them out. For instance, that it should be made illegal for any British citizen after a given date to own or hold shares in the industry either at home or abroad, which is primarily devoted to the production of war materials. It would be difficult to enforce that, even if it was part of the law, would it not?

Mr. Fenner Brockway: It would be difficult; but surely the danger of war in the world is enough to make us try to get over obstacles of that kind.

862. *Chairman*: Certainly, yes.

Mr. Fenner Brockway: After all, there are certain illegal industries. It is illegal now in the British Empire to own slaves. It would be illegal to hold shares in a company which was owning slaves. Well, war is just as great a disaster to the world as slavery, and the time will surely come when we shall make it illegal to own shares in any industry which is making munitions of war.

(After a short adjournment.)

863. *Dame Rachel Crowdy*: I should like Mr. Fenner Brockway to tell me what a workmen's council consists of, or a workers' council. Who would be represented on that? You say "all grades of workers employed", but does that include managers as well?

Mr. Fenner Brockway: It would certainly include the staff, the clerical staff.

864. *Dame Rachel Crowdy*: Yes, but not only the people who are managed on the staff but the people who manage the staff as well?

Mr. Fenner Brockway: Yes. I mean we should make it representative of every section of worker in the industry.

865. *Dame Rachel Crowdy*: But only the employed and not the employers at all?

Mr. Fenner Brockway: It depends what you mean by that. I should regard anyone in a staff position who was doing a paid salaried job as a worker.

866. *Dame Rachel Crowdy*: That is what I wanted to know.

Mr. Fenner Brockway: I should not regard him as an employer.

867. *Mr. Spender*: You would not say, would you, that the Admiralty relied alone on Mr. Mulliner for their information?

Mr. Fenner Brockway: No. I think the initiative was taken by Mr. Mulliner. It is some distance away in time. I do not know of other sources of evidence. I do not think they have been revealed.

868. *Mr. Spender*: Well, naturally not. My recollection is somewhat different but it was certainly that the initiative came from the Admiralty.

Mr. Fenner Brockway: Excuse me; I do not know of any public document or any speech which has indicated that.

869. *Mr. Spender*: The initiative came, of course, from the German programme of the previous year, the 1908 German programme.

Mr. Fenner Brockway: Yes, but I understand that it was Mr. Mulliner who in the first instance went to the Admiralty.

870. *Mr. Spender*: I rather think that is not so; but still we can leave it. It would be true to say, would it not, that in 1913 after Mr. Winston Churchill had become First Lord of the Admiralty he found it necessary to propose a very considerable increase in the Fleet?

Mr. Fenner Brockway: Oh yes, quite so.

871. *Mr. Spender*: So it does not seem that Mr. Mulliner's information was very much wrong?

Mr. Fenner Brockway: I should say that that arose out of the Agadir incident in 1911.

872. *Mr. Spender*: That is far back, is it not?

Mr. Fenner Brockway: Yes, but Mr. Mulliner, if my recollection is right, is 1909.

873. *Mr. Spender*: That is true. In 1912 and 1913 it again became necessary, according to the opinion of the Admiralty, to make a large increase of the British Fleet?

Mr. Fenner Brockway: Yes; again after the Agadir incident the rivalry between Germany and Britain was increasing greatly. I should have dated it from the Agadir incident in 1911 and the revelation at that time of the secret clauses in the treaty between Britain and France.

Mr. Spender: Well, that takes us into deep waters. I should be very glad to follow you another time.

874. *Sir Philip Gibbs*: I see you say that you advocate that no exports of arms should be permitted at all from this country; but supposing, for instance, that a small nation were attacked aggressively and wantonly by another nation, would you also prohibit the export of arms to help that small nation?

Mr. Fenner Brockway: Yes, personally I should, and I think probably, speaking for my party, we would. We do not take the view that small nations are just attacked wantonly. We take the view that foreign policies are a much more complicated matter

20 June, 1935.]

MR. FENNER BROCKWAY.

[Continued.]

than that, and that very often one says a small nation has been attacked, as Belgium was attacked in the War, but there are much more complicated issues behind it all; and generally speaking my Party would say that we would certainly oppose the export of war materials for any government of a capitalist nature. Undoubtedly we would say that.

875. *Sir Philip Gibbs*: For instance, you would be against the export of arms to China, you say, if you believed that it was wantonly attacked by Japan?

Mr. Fenner Brockway: Yes. We would adopt rather the other method. We would press for a government embargo upon war materials to Japan and we would urge direct action by the workers to prevent it.

876. *Sir Philip Gibbs*: Of course, you have admitted that these proposals of yours are extremely drastic and far-reaching, and I imagine that you would agree that they are not likely to happen quite soon?

Mr. Fenner Brockway: I am afraid not.

877. *Sir Philip Gibbs*: Would the Independent Labour Party support something a little less drastic, that is to say, if you cannot carry out the whole of these provisions, I imagine that you would be in favour of a general limitation of arms internationally?

Mr. Fenner Brockway: Yes, we should vote in favour of it undoubtedly. We should vote in favour of a simple proposition of nationalisation, but we should emphasise the point as to how inadequate we would regard those measures.

878. *Sir Philip Gibbs*: Would you approve of unilateral action in this country with regard to nationalisation without an international agreement?

Mr. Fenner Brockway: Yes, I think undoubtedly.

879. *Sir Philip Gibbs*: From a moral point of view?

Mr. Fenner Brockway: We would support that from a moral point of view; but I do not think necessarily nationalisation of the armaments industry in this country does involve nationalisation in other countries.

880. *Sir Philip Gibbs*: But do you think that it would do any practical good to have a nationalisation in this country of the arms manufacture without an international agreement on that subject?

Mr. Fenner Brockway: Yes, I think it would be of a certain value. The major proposals here are related to this country; and we would have those proposals carried out even if they were not carried out in other countries.

881. *Sir Philip Gibbs*: You do not think it would put this country into a rather dangerous position?

Mr. Fenner Brockway: Well, I understand that Dr. Addison argued yesterday that nationalisation is desirable from the point of view of making the armaments industry more efficient for war purposes.

882. *Sir Philip Gibbs*: Of course, the people who attack nationalisation base it upon the fact that whether we nationalise or not the same movement of arms from one nation to another would occur, so that you would not remedy any abuses in the traffic in arms. Would you agree with that?

Mr. Fenner Brockway: I should say we would remedy certain of the abuses and very considerable abuses because of the exceedingly important position which the British armaments trade occupies in the world. After all, our exports of arms are greater than any other. Vickers is probably as important an armament firm as any in the world in reference to international relationships, and if these proposals were put into operation I cannot see that happening in this country.

883. *Sir Philip Gibbs*: Supposing, for instance, we were to nationalise and prohibit the export of arms, would not that simply increase the markets of other nations who did not take that point of view?

Mr. Fenner Brockway: Yes, I think it would, but I cannot imagine for one moment our putting through proposals of this kind without them having,

for example, a tremendous repercussion in America. I should have said that the demand for drastic proposals is stronger in America, has more public opinion behind it in America, than here; and if we were to adopt these proposals here they would certainly extend to America and there would be increased pressure for them in other parts of the world.

884. *Professor Gutteridge*: That is not what happened in the case of slavery, though, was it? I think we abolished slavery some thirty years before America did?

Mr. Fenner Brockway: Yes. They were rather different circumstances.

885. *Professor Gutteridge*: I am afraid I do not share your optimism on that point; that is all.

Mr. Fenner Brockway: Well, I base it on a little knowledge of the strength of the movement in America.

886. *Sir Philip Gibbs*: I want to ask you one or two more questions. Mr. Walton Newbold this morning rather suggested that the labour employed in the centres of armament manufacture like Coventry were naturally from a trade point of view, and from the desire to have good wages, in favour of a continued demand for arms, and would therefore, perhaps, be against any plan which would limit the demand for manufactures of that kind. Now from your experience in the Independent Labour Party, do you think that that is a fair statement of the attitude of the working men in those centres?

Mr. Fenner Brockway: I can speak of Sheffield rather more than of Coventry. I should say this, that quite naturally the main desire of the workers there is to get work and to have a wage and to have security for their families. That is their main desire and they would rather have security which comes from a war industry than no security at all; but whilst they say that I do not think there is any doubt at all that they would much prefer to be at work on peace industries rather than war industries. In all my experience that has been the case. At conferences against war and for disarmament in that area we have actually had representatives from the firms engaged in the manufacture of war materials. I think that is probably an accurate statement.

887. *Professor Gutteridge*: I want to ask you whether you have considered the question of other state enterprises trading in arms. That is not an impossibility, is it—that if you had universal nationalisation of the arms industry a country might indulge in the traffic of arms?

Mr. Fenner Brockway: Yes, except that under these rules it would be prohibited from doing so.

888. *Professor Gutteridge*: But you would have to secure that somehow would you not?

Mr. Fenner Brockway: Certainly.

889. *Professor Gutteridge*: I do not quite see where it comes under your rules.

Mr. Fenner Brockway: Yes, I think it does.

890. *Professor Gutteridge*: Oh, possibly under the last.

Mr. Fenner Brockway: It comes under (f) in relation to (j): "The export from Britain of materials for war purposes shall be absolutely prohibited . . . (j) The British Government having adopted these methods to eliminate profit-making from war preparations"—that is in Britain—"should do its utmost to get them adopted internationally."

891. *Professor Gutteridge*: You would have to make sure of that, I think, would you not?

Mr. Fenner Brockway: Well, I would do it as a precedent even if we could not get it done in other countries.

892. *Mr. Spender*: Would you compensate these firms whom you propose to abolish?

Mr. Fenner Brockway: I should apply exactly the same principle as is applied to a man who loses his work. A man who loses his work is given unemployment benefit. His family, we think, is very

20 June, 1935.]

MR. FENNER BROCKWAY.

[Continued.]

inadequately maintained. If there was need in the case of these owners for their families I would give that amount of compensation, but I should not accept the principle of compensation as a whole. I do not see that an employer or an owner has any more right to it than a worker. A worker loses his job; an owner loses his shares.

893. *Chairman*: We are much obliged to you. I think those are all the questions we wanted to put to you. Is there anything you want to add?

Mr. Fenner Brockway: Yes. I wonder whether you would permit me to add this. I happened to be in the room when Dame Rachel Crowley put a question about illicit trading to my predecessor in the box, Mr. Walton Newbold.

894. *Dame Rachel Crowley*: I am prepared to ask Mr. Fenner Brockway that question again if he likes.

Mr. Fenner Brockway: I happened to hear it, and there are just two or three instances to which I want to draw your attention. The first is rather an amusing one which came before the United States Senate Committee on Foreign Affairs.

895. *Chairman*: What is it you are reading from? Is it something that we have got?

Mr. Fenner Brockway: No, I am afraid it is not. I am reading from my own notes, as a matter of fact. The United States Senate Committee on Foreign Affairs was inquiring into a proposed embargo on war materials in 1932, and Mr. Thomas A. Morgan, the President of the All-American Aeronautical Chamber of Commerce, was giving evidence and he complained then that European armament firms were sending high class fighting aircraft to the Canton Government and simply leaving off the machine guns and calling them commercial 'planes. The amusing fact was that Mr. Green, a member of the War Department of the United States, pointed out that American firms were doing exactly the same thing in another way: they were sending to China 'planes which were certified as civil 'planes, but through the post were sending blue prints indicating the manner in which these 'planes could be converted into military 'planes.

896. *Chairman*: Is that Mr. Green of the Federation of Labour?

Mr. Fenner Brockway: Oh no; this is Mr. Green, an official of the State Department, a government official, giving that as his government information. The second point to which I want to draw your attention in this matter is dealt with in Exhibit 84 of the American Arms Inquiry. That evidence showed that in 1934 there was tension between Peru and Colombia—not actual hostilities, but great tension—and Vickers supplied 1,200 rounds of 3-in. ammunition for the sum of 50,000 dollars. It was shipped to Para in Brazil, then from Para sent to the West Indies, and from the West Indies handed over to a Peruvian ship. It was part of a contract by which the Electric Boat Company of America was delivering two gunboats to Peru. This order was kept secret but it was revealed in an American technical paper. Mr. Henry R. Carse, the President of the Electric Boat Company, then wrote to Mr. Spear, another member of the company, as follows: "I understood it was our intention to camouflage this transaction so as to avoid any complaints being raised in Washington by the Colombian authorities which might prevent delivery of the vessels."

897. *Dame Rachel Crowley*: That was being exported from here, was it not?

Mr. Fenner Brockway: The ammunition was being exported from here.

898. *Dame Rachel Crowley*: Was that under a Board of Trade certificate, do you know?

Mr. Fenner Brockway: I should imagine so.

899. *Dame Rachel Crowley*: Was its destination declared, do you know? Have you been into that?

Mr. Fenner Brockway: Again I should imagine so. I imagine Vickers will have got a certificate.

900. *Dame Rachel Crowley*: Vickers will be able to answer that question.

Mr. Fenner Brockway: I think the probability is that Vickers got a licence to send the ammunition to Peru. The difficulty was obviously getting round Washington rather than around London. But the third case is the one to which I wanted to draw your particular attention. The United States Government placed an embargo upon war materials to Paraguay. Du Pont, the big chemical industry of America, was asked to quote for the supply of chemical powders for explosive purposes. They have the very closest relations with the Imperial Chemical Industries of this country, and in reply to this application to quote they said: "Advise Ferreira"—that is the man who was negotiating with the Paraguayan Government—"Cannot quote owing to embargo. I.C.I. London will quote direct to you." Then they sent a letter to the I.C.I. in this country in which they say: "Attached is confirmation copy of our cablegram of 7th June informing you that Sr. Manuel Ferreira, our agent in Paraguay who is now in Buenos Aires, asked us for prices c.i.f. Montevideo on 200 kilos Picric acid and 2,000 kilos Flake T.N.T. We also informed you in our cablegram that we could not quote from this end owing to the embargo on munitions and military propellants decreed by President Roosevelt. In view of the fact that there is no similar embargo obtaining in England, we suggested that you quote prices to your office in Buenos Aires, who in turn would advise Ferreira. Although the inquiry distinctly states that prices are wanted c.i.f. Montevideo, we suspect that the material is for Paraguay, and since we wish to co-operate with our government in observing the embargo, we deemed it best not to quote."

901. *Mr. Spender*: What is the date of that?

Mr. Fenner Brockway: 7th June, 1934. I want to be quite careful about the date, because it is not actually given on the letter here.—Yes, 7th June, 1934. That is correct.

902. *Dame Rachel Crowley*: Is that an American Exhibit, too, at the Nye Committee?

Mr. Fenner Brockway: Yes, on pages 1337 and 1338 of Volume 5 of the Proceedings; and there because of the agreement between Du Ponts and the I.C.I., when an embargo is put upon the export from America they arrange that it shall be carried through by the I.C.I. in this country.

903. *Sir Kenneth Lee*: Has it not struck you that, in view of the fact that all the files of these people were seized, they found exceedingly little?

Mr. Fenner Brockway: I should not say so.

904. *Sir Kenneth Lee*: Well, what you have quoted now are very small incidents?

Mr. Fenner Brockway: I think they are very characteristic incidents, and I think—I have got to be careful how I put this—I think you would find that the American armament companies carried through a very extensive destruction of materials before the searches took place. I think you will find that to be the case, and that actually it was very curious how the investigators found odd references in letters, and from those odd references they followed up and they got further evidence.

905. *Dame Rachel Crowley*: I should like, if I may, to substantiate that statement of the witness, because Senator Nye told me that himself—that they had been able to find out cases, not by the records that they found with the big firms, but by slight references in letters that they found in the small firms, which is your point, is it not?

Mr. Fenner Brockway: I think after that statement I can say it was Senator Nye who was the source of my information.

906. *Chairman*: I think, if that is all you wish to add, that is all we wish to ask you, and therefore we will adjourn now for the day. To-morrow we will meet at 10.30 and continue the questions to Dr. Addison.

(Adjourned to to-morrow, 10.30 a.m.)

APPENDIX.

STATEMENT OF EVIDENCE TO BE SUBMITTED ON BEHALF OF THE
INDEPENDENT LABOUR PARTY.

1. So long ago as 1921 the First Sub-Committee of the Temporary Mixed Commission of the League of Nations reported a series of charges made against armament firms. The evidence given to the Committee has not been published, but the efforts of investigators in various countries have revealed a considerable body of facts which support the charges. In particular, the proceedings of the Special Committee of the United States Senate Investigating the Munitions Industry have been important in this respect. Below we reproduce the charges, with relevant evidence relating to British firms.

2. The American Inquiry has been able to obtain important evidence because it has the power to examine the files and books of any firm in the United States which manufactures munitions. In respect of evidence it has the same authority as a British court of law possesses, with the rights of search given by a search warrant. If papers or witnesses are refused, the defaulters can be found guilty of "contempt of the Senate" and can be fined or imprisoned. Perhaps equally important, the American Inquiry has a staff large enough to carry out the investigation thoroughly. There are thirty trained investigators, who have the power to enter the premises of any firm engaged in the production of war material and demand to see all papers, books and letters. The thirty investigators are supported by a staff of thirty office workers.

3. If the present British Commission had similar powers, it would not be necessary for organisations like the Independent Labour Party to submit evidence regarding the activities of British armament firms. The facts could be obtained directly. We are under the disadvantage of having to rely upon such facts as have been revealed either casually or through the American Inquiry.

4. We reproduce below the charges reported by the League of Nations Committee and indicate supporting evidence. If we were to include evidence regarding the armament firms of other countries it would be possible to justify every charge. For the purpose of this Inquiry we have limited evidence to that relating to British firms:—

- (a) *Armament firms have been active in fomenting war scares and in persuading their own countries to adopt warlike policies and to increase their armaments.*

The Liberal Government elected in 1906 adopted a policy of reduced expenditure on armaments. From 1908 to 1910 the profits of armament firms fell seriously. The dividends of Vickers and Armstrong, for example, fell from 15 to 10 per cent.

On March 3rd, 1909, Mr. Mulliner, manager of the Coventry Ordnance Works, was received by the Cabinet and convinced its members that the German Government was secretly accelerating her naval programme. Mr. Asquith, the Prime Minister, and Mr. McKenna, the First Lord, announced in the House of Commons that Germany would build seventeen Dreadnoughts by March, 1912, instead of the nine publicly announced. Parliament immediately voted an increase of naval expenditure of £4,608,002 for the building of four Dreadnoughts. Of this amount £4,409,502 went to the private armament firms. Before the end of the year the Government responded to a demand, fostered by the leaders of the Opposition and the popular press, for four more Dreadnoughts. When March, 1912, came the statements of Mr. Mulliner were proved unjustified. This incident undoubtedly contributed to the tension which preceded the World War.

The immediate result of Mr. Mulliner's approach to the Cabinet was to send up armament profits. The

profits of Vickers the year before were £424,000. In succeeding years they were: £474,000; £544,000; £745,000; £872,000.

- (b) *Armament firms have attempted to bribe Government officials both at home and abroad.*

Early in 1910 Rear-Admiral Fujii was sent by the Japanese Government to Britain to report upon estimates submitted by Vickers and Armstrong (then separate firms) for a battle cruiser. He recommended the acceptance of the Vickers estimate, and in November, 1910, a contract to the value of £2,307,100 was signed.

Admiral Fujii was in 1914 concerned in a case in the Japanese courts. Evidence was given that he was on intimate terms with the director of the Vickers works at Barrow, that the director had asked the admiral to show his goodwill towards Vickers, and that after the accused's return to Japan, the director, with a view to reciprocating his goodwill, had remitted, over a period of years, certain large sums of money to the admiral. (*Japanese Weekly Chronicle*, June and July, 1914.)

Three years previously, according to the same paper, Admiral Fujii received "remitances" in connection with an order given by the Yarrow Shipbuilding Yard; a "remitance" of £1,000 from Weir and Co. in connection with an order for machinery and pumps; and a gift of £1,750 from Arrol & Co. subsequent to an order for materials valued at £33,620.

We have no evidence of bribery of Government officials at home. There is, however, a subtle method adopted by armament firms for obtaining influence over Government departments to which attention should be called. It is their custom to appoint to their directorates, or to important posts in their service, officials of high standing in the Ministerial departments on their retirement from Government service. This custom, whilst it cannot be described as bribery, has certain advantages which have been stated frankly by the technical newspaper *Armaments and Ammunition* (September, 1913):—

"Contractors naturally are very keen to avail themselves of the services of prominent officers who have been associated with work in which the contractors are interested. The chief thing is that they know the ropes, since the retired officer who keeps in touch with his old comrades is able to lessen some of these inconveniences, either by gaining early information of coming events or by securing the ear of one who would not afford like favours to a civilian. . . . Kissing undoubtedly goes by favour, and some of these things that happen might be characterised as corruption."

The directors of Vickers-Armstrong include six retired high-placed officials in Government circles or ex-officers in the fighting services:—

General the Hon. Sir Herbert Lawrence. Chairman of Vickers since 1926. Chief of Staff, Headquarters, British Army in France, from January, 1918. Left Army on retired pay, 1922.

Sir Mark Webster Jenkinson. Formerly Controller of the Department of Factory Audit and Costs at the Ministry of Munitions, and Chief Liquidator of Contracts at the Ministry of Munitions after the War.

General Sir J. F. Noel Birch. After a long military career was Artillery Adviser to the Commander-in-Chief in France, 1916-19. Director of Remounts, 1920-21. Director-General of the Territorial Army, 1921-23. Master-General of the Ordnance and Member of the Army Council, 1923-27.

Sir J. A. Cooper. Principal in Charge of Raw Materials Finance at the War Office, 1917-19; then became the Director of Raw Materials Finance at the Ministry of Munitions, 1919-21.

Sir A. G. Haddock. Formerly an Associate Member of the Ordnance Committee.

Engineer Rear-Admiral R. Beaman. Deputy Engineer-in-Chief to the Admiralty since 1932. (Admiral Beaman was appointed "Special Director" and Engineering Manager at Barrow in May, 1935.

- (c) *Armament firms have disseminated false reports concerning the military and naval programmes of various countries in order to stimulate armament expenditure.*

See evidence under (a).

- (d) *Armament firms have sought to influence public opinion through the control of newspapers in their own and foreign countries.*

We have no evidence of this in connection with British firms, though there is considerable foreign evidence.

In this connection, however, attention should be drawn to the allegations that several of the foreign correspondents of the *Times* have also been agents of Vickers.

- (e) *Armament firms have organised international armament rings, through which the armaments race has been accentuated by playing off one country against another.*

- (f) *Armament firms have organised international armament trusts, which have increased the price of armaments to governments.*

Before the War there were two international rings of gunpowder and explosive manufacturers with which British firms were connected.

The Nobel Dynamite Trust Company was registered as a British company. It owned, or was interested in, six British companies, with three of which Vickers shared directors. It was similarly connected with four German firms, and was one section of the International Cartel of Powder Manufacturers, which represented firms in Britain, Germany, France, Russia and Japan. During the War this trust supplied gunpowder and explosives both to Germany and Britain. Its German and British partnership was only dissolved in May, 1915, nine months after the outbreak of war. Despite the fact that enemy property was generally confiscated, the British and German Governments gave passports for agents of this trust to meet in Holland to arrange for an exchange of shares.

Similarly there was the Chilworth Gunpowder Company, with headquarters at Vickers House, Westminster. It had 13 shareholders. Four of these bore the name of Vickers. A fifth (Sir Trevor Dawson) was the managing director of Vickers, a sixth (Mr. Meade Falkner) was a director of Armstrong. Among other directors were Louis Hagen and Carl Duttenhofer, directors of the German Arms and Munitions Factory.

There was also an international armour-plate ring known as the Harvey United Steel Company, in which all the leading armour-plate firms were associated. The chairman was Mr. Albert Vickers, the managing director of Vickers-Maxim. Its directorate included representatives of the four main British armour-plate firms at the time (Charles Cammell, John Brown, Armstrong-Whitworth, and Vickers-Maxim), the two most important German firms (Krupp and Dillinger Steel), the three chief French firms (Schneider, Chatillon Steel and St. Chamont Steel), the Terni steel works of Italy, and the Carnegie Steel Company of the U.S.A. This group of firms was linked with nearly all the armour-plate companies in the world, covering (in addition to the countries mentioned above) Russia, Austria, Japan, Spain and Portugal.

Since the War the armament firms have not been so openly associated in international organisations,

but international connections are close and there is evidence of international agreements. Vickers-Armstrong has associated companies not only in the British Empire (Canada, Ireland, New Zealand and India), but in Spain, Italy, Rumania, Holland, Poland, France, Japan and South America. The associated companies include the Sociedad Espanola de Construcción Naval, of Spain, the Societa Vickers Torni, of Italy, the Fokker and Junkers Company (Dessau), of Holland, the Societe de Material de Guerre, of Poland, the Japanese steel works, a part of the Japanese armament combine, Mitsui. Vickers-Armstrong has works in Rumania and at the time of the Vickers-Armstrong amalgamation the subsidiary companies included Vickers-Schneider (which links up Vickers with the great French combine, Schneider-Creusot) and companies in South America.

During the proceedings of the American Inquiry an agreement between the Electric Boat Company of New Jersey and Vickers, Ltd., was entered as an "exhibit." Under this agreement Vickers takes 60 per cent. of the profits on submarines built in Vickers' yards in Britain and the E.B.C. 40 per cent.; in the case of submarines built in other yards in Britain and Ireland, or yards in continental Europe, the two companies share profits. The agreement also contains provisions for the division of the world into reserved territories for submarine selling by the two companies. The British Empire is reserved exclusively for Vickers. The U.S.A. and its colonies and dependencies, and the Republic of Cuba, are reserved exclusively for the E.B.C. Correspondence between the two firms, entered as "exhibits" at the American Inquiry, made it clear that the relations of Vickers and the E.B.C. are used to "increase prices." We draw your attention particularly to exhibit No. 91 (a letter from Mr. Henry R. Carse, President of the E.B.C., to Sir Trevor Dawson, chairman of Vickers, Ltd.), and exhibit No. 125 (a letter from Sir Charles W. Craven, of Vickers, to Mr. L. Y. Spear, of the E.B.C.).

5. To these charges reported by the League of Nations Committee many could be added. We wish to draw your attention especially to these further facts:—

- (a) *British armament firms have produced war materials for other countries which have been used against Britain in time of war.*

For example:—

The Turkish arsenal and dock at the Golden Horn and the naval base at Ismid, used against British and Australian troops with such terrible effect in the Dardanelles, were maintained up to the very eve of the war by Vickers and Armstrong. They signed the contract with the Turkish Government at the end of 1913. Mr. Hugh Dalton stated in the House of Commons on 11th March, 1926, that the "shells which were fired into the Australian, New Zealand, and British troops" were also supplied by Vickers.

The docks of Henry Whitehead & Co. (a subsidiary of Vickers and Armstrong) at Fiume in Austria provided torpedoes, torpedo-boats, torpedo-boat destroyers, submarines and mines for Austria immediately before the World War and during the War these docks were used to supply the navies of the Central Powers.

- (b) *British armament firms have prolonged the war between Paraguay and Bolivia, despite the "outlawing" of this war by the League of Nations, by supplying war material to both sides.*

According to the British Government's returns, 2,130,550 rounds of ammunition were exported to Bolivia between January, 1932, and June, 1933, and 16,570,000 rounds to Paraguay. In addition, 90 machine guns and 6 tanks were exported from Britain to Bolivia.

(c) *British armament firms provided the Japanese Government with war materials for use against China, despite the condemnation by the League of Japanese aggression.*

During 1932, according to official figures, British armament firms exported to Japan 5,361,450 small-arm cartridges, 4,909 cwt. of high explosives, and other explosives to the value of £40,239.

(d) *Although the re-armament of Germany has been condemned by the British Government, British armament firms have advertised field artillery in the German military press and have supplied Germany with aeroplane engines.*

Vickers-Armstrong advertised 105 mm. field artillery in the *Militär-Wochenblatt*, in April, 1932. (See reproduction of advertisement in "The Bloody Traffic.")

In May, 1934, eighty Armstrong-Siddeley aeroplane engines were sold to Germany. This is not an isolated instance.

It may be added that raw materials necessary for war preparations have also been exported heavily from Britain.

Financial News of 15th May, 1935, stated:—

"a large part of the increase of German imports from Britain is accounted for by the extra imports of such essential war materials as iron ore, copper ore, mineral oils, etc. . . . In every single instance, net imports into Germany of any one outstanding war materials have shown a more or less spectacular rise in 1934. And on balance the first three months of this year show a continuance of that tendency."

The same issue of the *Financial News* reports that German firms have been given £5 millions credit by British firms to enable them to make these and other purchases.

(e) *British armament firms have provided war materials to the Chiang Kai Shek Government in China for its war against the Chinese Soviet Republic.*

The official returns of British arms exports to China are significant. They rose in value from £7,300 in 1932 to £223,000 in 1933. In 1932, British armament firms were exporting arms in the Far East mainly to Japan to be used against the Chinese Government. In 1933, the British armament firms began heavily to assist the Chinese Government in its war against the Chinese Soviet Republic.

6. We are aware that the armament firms are only permitted to export arms openly to other countries under licences received from the British Government. This does not absolve from blame the armament firms which have supplied governments conducting wars condemned by the League, but it does also involve the Government in the responsibility.

Sir John Simon has explained that licences are only granted when the exports are consigned to *de facto* governments. Under present conditions the rule to supply only recognised governments with arms may mean that war materials from this country are being used to maintain cruel tyrannies. In the case of China, for instance, most liberal-minded people, in addition to Socialists, would recognise the Chinese Soviet Republic as far more civilised than the Chiang Kai Shek Government.

An incidental point of importance should be emphasised. British workmen are employed on the production of these war materials without any knowledge of where they are to be used. They may accordingly be engaged in making death-dealing instruments to destroy those with whose cause they sympathise. In our view workmen have a right to know for whom and for what purpose they are making materials of slaughter. So long as exports in war materials are permitted, the public, and particularly the organisations representing the workers employed in making them, should be informed of the intended destination of any order before it is put in hand.

7. The methods of armament firms, as indicated above, are specially repugnant because they deal in articles of human slaughter; but it should be recognised that they are following the normal practices of industries under the present economic system of capitalism. The capital of armament firms is provided by shareholders who expect dividends and welcome high dividends. The dimension of the dividends depends upon the sale of goods and the margin of profit made upon the orders received. To achieve these results armament firms adopt the ordinary methods of business. The most efficient goods must be produced. A market must be created by smart salesmanship, enterprising publicity, and the careful encouragement of conditions which facilitate orders. Goods must be sold within the limits of the law to whomsoever will buy. Rings and trusts must be formed to extend orders and keep up prices. If instances can be cited of the use of bribery to obtain orders, it will not be pretended that this method is confined to the armaments industry.

8. But there is this difference between the armaments industry and most industries. With few exceptions (however badly they may function under capitalism), other industries are engaged in the production of goods necessary for life or the enjoyment of life. The armaments industry, on the other hand, is engaged in the production of goods for the purpose of death. Those goods are the most efficient which enable the most human beings to be killed with the greatest ease. The success of salesmanship and publicity is measured by the extent to which these death-dealing goods are spread over the world. The conditions to be created for good business prospects are international tension, circumstances threatening war, and the intensification and prolongation of war when it occurs. The purchasers of the goods may be enemy governments which will use them to decimate the fellow-citizens of the armament-makers. The rings and trusts may be used, to quote the League report, "to play off one country against another" in armaments rivalry and to hold governments up to ransom by extorting higher prices. These differences naturally invite the question whether the community should permit this industry to remain on a profit-making basis and in its search for markets to encourage conditions endangering peace.

9. We submit that it is urgently necessary to end the motive of profit-making in all war preparations.

10. On examination, however, it will be found that it is difficult to separate the industries engaged in the production of war materials from ordinary industry. The war industry is interwoven with the whole economic system. Most of the war material industries are also engaged in the production of goods for civil purposes; armament industries construct machinery, transport vehicles, typewriters. The chemical industries which produce explosives and poison gas, produce chemicals for peace purposes on a large scale. The aircraft works which produce fighting and bombing 'planes, produce 'planes for civil purposes. The oil companies, which play an important part in the economic preparations for war, provide oil for motor and ship transport and for industry generally.

11. There are also close connections between the war material industries and other industries, and particularly the banks. Vickers, for instance, is associated with electrical, rubber, steel, iron, and coal companies (see *Economist*, 4th August, 1934), and its directorate is closely linked with banking concerns. General Sir Herbert Lawrence, chairman of Vickers-Armstrong, is also the chairman of the Anglo-International Bank, Ltd., and managing partner of Glyn Mills & Co., the important bankers, and a director of the Bank of Rumania, Ltd., and a member of the London Committee of the Ottoman Bank. Sir O. H. Niemeyer, another director, is one of the most influential figures connected with the Bank of England, and is also a director of the Anglo-International Bank, Ltd., and a member of the London Committee of the National Bank of Egypt. The directors of Vickers-Armstrong

have connection with banking concerns in America, China, India, Australia, Rumania, Turkey and Egypt. Moreover, the banks have a large share in the ownership of armament firms. The banks have larger blocks of shares of all classes in Vickers, Ltd., than any individual except Mr. Douglas Vickers (with others). The following are instances:—

Westminster Bank, Ltd.

10,291 ordinary

3,440 5 per cent. cumulative preference.

Clydesdale Bank, Ltd.

9,473 ordinary.

2,360 5 per cent. cumulative preference.

Messrs. Coutts & Co.

7,768 ordinary.

S. Japhet & Co.

6,702 ordinary.

12. When we come to examine the international connections of the war material industries the deep way in which they are embedded in the present economic structure is emphasised still further. We have already indicated the international connections of Vickers. Of equal importance is the Imperial Chemical Industries, Ltd., which has a virtual monopoly in this country in the preparations for chemical warfare. Exhibit No. 461 in the proceedings of the American Inquiry gives the subsidiary companies of the I.C.I. and its investment and contractual interests in world markets. The list shows that the I.C.I. has 21 "Foreign Alliances": eight in Belgium, five in France, three in Germany, two in Italy, and one each in Norway, South Africa and Switzerland. It has, in addition, foreign investments in 30 companies: U.S.A., 6; Belgium, 3; Australia, 3; two each in France, Czecho-Slovakia, Germany, and South Africa; and one each in Austria, Spain, Hungary, Canada, Rumania, Argentina, Chile, China, India and Japan. These companies manufacture explosives, sporting ammunition, fuses, detonators, nitrogenous fertilisers, ammonia and dyestuffs. Practically all are potential manufacturers of war materials—gases, explosives and ammunition, etc.—but they are also an important part of peace industry.

13. It is clear that a proposal to nationalise war material industries within Britain would not be enough. Recommendations to be effective must also deal with the participation of British concerns in the war industries abroad. Even if an international rule were adopted, say on the initiative of the League of Nations, that industries engaged in the production of war materials should be nationalised in all countries, the problem would not be solved. The difference in the case of the small nations would, under present conditions, be more apparent than real. The governments of such nations would only be able to nationalise their war industries by raising international loans. Such loans would be floated in London, Paris, New York and other financial centres. The financiers behind these loans, and the governments supporting them, would in fact be the owners of such industries.

This opens up dangerous prospects of small nations being used as the pawns of the big powers, which would naturally utilise their economic resources to win prospective allies. A new form of Economic Imperialism would be developed in which the governments of the big powers would be directly involved in maintaining the efficiency of the nationalised war industries of their smaller allies. It would obviously be in the interests of the associated "nationalised" industries to exchange information regarding new processes and new destructive instruments and chemicals. Rivalries would probably develop between the different groups of big powers and satellite nations. Political alliances would be supplemented by war-industry alliances. This is not a

reassuring prospect. Any remedies to be effective must clearly deal with the question of international loans for war industries.

14. Such facts as these indicate that the problem of the war industries is inseparable from the whole political and economic system under which we live. To adopt a phrase which has recently become famous: The economic structure of capitalism is one and indivisible. "Then where's the hope this trade in death will die?" the late Mr. Israel Zangwill made one of his characters ask. The answer was, and is:—

"There IS none while this social order lives.

"The man of business is the God of War,

"And gold pulls all the strings and all the triggers."

15. Meanwhile, we make the following recommendations with the object of removing so far as is possible the profit-making incentive from war preparations. They are designed to deal not only with the war industries in Britain, but also with British-owned companies in other parts of the world and with the relations of British companies to companies abroad:—

(a) All establishments in Britain—factories, mills, workshops, laboratories, etc.—which are primarily devoted to the production of war materials shall be nationalised, and shall be placed under a Minister directly responsible to Parliament. A workers' council, representing all grades of workers employed, shall be responsible for the control of the working conditions in these establishments.

(b) All British concerns owning establishments abroad which are used for the production of war materials shall transform them by a given date into establishments for the production of peace goods, or else disband them.

(c) All British concerns which have arrangements with companies abroad for the production or sale of war materials, shall end them by a given date.

(d) It shall be made illegal for any British citizen after a given date to own or to hold shares in any industry, either at home or abroad, which is primarily devoted to the production of war materials.

(e) If orders for war materials are given by the Government to any concern not state-owned, the work shall be done on a costings basis without profit.

(f) The export from Britain of materials for war purposes shall be absolutely prohibited.

(g) No British firm, bank, or individual shall participate in loans for the purpose of the production, transport, or sale of war materials in any part of the world.

(h) It shall be a criminal offence for any British citizen to solicit for orders for war materials or, on behalf of any firm, to attempt to exert influence against any proposals which may bring about a reduction of such orders.

(i) Committees of workers shall be appointed in all establishments concerned at any time in the production of war materials to assist in ensuring that these regulations are carried out. A national committee representative of the workers' organisations shall be appointed for a similar purpose.

(j) The British Government, having adopted these methods to eliminate profit-making from war preparations, shall do its utmost to get them adopted internationally.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (a) by the United Kingdom alone, (b) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

FOURTH DAY

Wednesday, 19th June, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Chairman: Before commencing the hearing of Dr. Addison's evidence, I feel it right to make a short statement with reference to something that Mr. Pollitt said on the last occasion when we met. He said that my name appeared on the register of Imperial Chemical Industries Ltd., as the holder of a substantial number of shares in that Company. Had it not been that I was a member of this Commission I should not have taken any notice of the statement, but I recognise to the full how important it is that a member of the Commission should be free from

any appearance of bias, and I therefore wish to state that, though for many years a number of United Alkali shares, recently converted into I.C.I. shares, stood in my name as trustee of the estate of a relative, that trust expired last year and all the shares were distributed and passed out of my name months before I was invited to become a member of this Commission. I hope that the Press, who reported Mr. Pollitt's statement, will also refer to this explanation of the facts.

The Right Hon. CHRISTOPHER ADDISON, P.C.,

M.D., F.R.C.S., M.P., called and examined.

570. *Chairman:* We are very much obliged to you, Dr. Addison, for coming to give us the result of your experience and your opinion. You have supplied us with a very full and detailed statement,* not only of the materials upon which you found your opinion, but a general history of the position during the time you were either Parliamentary Secretary or Minister, and also you have in this very full statement given us some idea of what the position was before you became directly connected with munitions work. Subject to what you may think, what I suggest is this. The full statement that you have submitted, containing not only your views as a result of your experience, but also all the materials—I will not say all the materials, but a fairly full statement of all the materials—upon which you founded that opinion appear in this printed document, and the document will appear as a whole as part of our proceedings; and, of course, that is necessary, because you would naturally wish that the materials upon which you found your opinion should appear at the same time as your conclusions and your opinion; and what I suggest (if it is convenient to you) would be convenient to us is that you should commence your evidence before us to-day at that point of this statement which you consider is the fair commencement of your conclusions, and, with regard to the earlier part, which contains the general history of the position, that you should merely indicate to us the heads that you wish us to bear in mind before you deal with your conclusions. Is that convenient and satisfactory to you?

Dr. Addison: Yes, I think that would be a convenient way of dealing with it; it being understood, of course, as you have explained, that the material upon which I have based my conclusions is a part of my evidence, although we do not go over it verbally.

571. *Chairman:* Then may I first of all indicate the position you occupied in reference to this matter? It appears in the first paragraph that you were informally appointed on the 26th May, 1915, I think, as Parliamentary Secretary, was it?

Dr. Addison: Yes.

572. *Chairman:* And you continued in that position, I think, from May, 1915, to July, 1917; you either continued to occupy that position or the position of Minister of Munitions?

Dr. Addison: That is so.

573. *Chairman:* And the earlier part of this document is concerned mainly with your experience during that period? You have also, by way of further introduction, given us some statement as to the position between October, 1914 and May, 1915?

Dr. Addison: Yes. I think that is material to indicate the reasons for a Ministry being established at all.

574. *Chairman:* Would you read to us your conclusions, just indicating the main points you wish to refer to, or shall we go straight to the point at which you think you would begin to deal with your conclusions—just as you prefer.

Dr. Addison: The first 22 paragraphs are narrative. They set out the position as we found it, and the reasons that emerged from our examination of the case and experience of the practical difficulties. They set out the reasons for my expressing the view that dependence upon private manufacture proved to be not only insufficient but dangerous, because of the reliance that it led the nation to have upon that system, which proved to be inadequate. The reasons for that inadequacy are set out in those paragraphs, and the results of the inadequacy in terms of arrears, and so forth. I analyse them as being in substance due to three main conditions which, I suggest, inevitably attach to that system, namely, its inelasticity—that is to say, it is not

* Appendix, p. 109.

capable of expanding in accordance with war requirements because of the limitations which necessarily attach to it—and its inadequate control over obtaining sufficient supplies of labour or materials or machinery, and securing their adequate and appropriate distribution for the purpose of war expansion. The conditions which, in my view, must attach to that system are set out in those 22 paragraphs.

I deal also in those paragraphs, particularly paragraphs 18 and onwards, with what, in my view, is the inevitable costliness of that system—the extravagance, or, at all events, the high costs that we found to attach to it—and what we had to do in order to check that. That is set out in those paragraphs.

Paragraphs 23 to 48 set out in detail what I believe to be the inherent imperfections of that system, which, because of our reliance upon it, are necessarily dangerous in time of war, and I think the facts abundantly showed that they were.

Then in paragraphs 48 to 54 I come to a set of matters which I think it may perhaps be material to refer to in detail later, when I describe the necessity of there being a single department. You will see there I tell the story of how, in the first instance, a Ministry had transferred to it certain duties, but that as a result of experience we found that it was necessary that certain others should be attached, until I am afraid in the long run we absorbed the whole lot more or less—the ordnance factories, the responsibility for design, inspection and filling, and generally the delivery of the completed articles, became the duties of the Ministry. You will see in paragraph 50, a decision of the War Council on the 27th January, 1916, whereby

“(a) The responsibility for designs, patterns and specifications, and for testing arms and ammunition rests with the Ministry of Munitions.

“(b) The Army Council is responsible for the general nature and amount of the weapons and equipment required.

“(c) When it is necessary that new weapons, stores, or articles of equipment should undergo practical trials by troops either at home or in the field the co-operation of the Army Council should be sought by the Ministry.

“(d) The Army Council should be represented on advisory committees or bodies under the Ministry of Munitions to the extent that they think desirable.”

Now, Sir, those four conclusions really emerged from the experiences of that year, and we found increasingly from the very beginning to the end that it was necessary to supply and manufacture that the powers and duties should be in one body, namely, the Ministry. Simply stated, it boils down to this: that the War Departments were to tell us what they wanted and we were to supply it; and from that time in the War to the end that arrangement remained unaltered and it worked quite well. The point I am making here is that bitter experience compelled us to obtain that concentration of design, manufacture, and all the rest of it, which is set out in this paper, and that that system must be adopted if we were unfortunate enough to have another war. That relates, anyhow, to the concentration of power. There is an exhibit there—Exhibit M*—which sets out that in detail. It relates particularly to the responsibility for design, and there are further notes about inventions, and so on, and Woolwich. If it is appropriate, I would like to answer questions which you may address to me later on this branch of the subject, because I see that Sir Eustace d'Eyncourt gave some evidence relating to the position of design in relation to supply. I do not want to interrupt my general review now, but I hope that later you will allow me

to return to that question, because I regard it as of great importance.

Then, leading up to what I recommend in paragraphs 48 to 54, I indicate—what is dealt with in detail a little later—the need, in my view, for a single department of state—and I indicate, merely as one of the many illustrations I could give you if you wished them, the difficulties that arose out of the manufacture of aeroplanes, which was, up to January, 1917, the business of a number of different departments—the War Office, the Admiralty, and the Air Board. I will ask you, in your cross-examination, if you will, to revert to that matter, because it is, in my opinion, a signal illustration of the waste which inevitably attaches to a system whereby different departments are ordering similar goods. Another disadvantage which attaches to that system which is of great importance, and related to what I said about design a minute or two ago, is referred to at the bottom of paragraph 53, where I indicate that, as a result of a number of different departments ordering similar goods, you came to have an endless multiplicity of types and a great overlapping of contracts, which lead not only to waste but to establishing a hindrance to adequate supply. That I will explain, if I may, in detail when you revert to it later, but it relates to this same issue of the concentration of authority with regard to supply and design, and provides a signal illustration of the need for it.

Then the next group of paragraphs, paragraphs 55 to 61, relate to what I think cannot be exaggerated from the point of view of its financial importance, and that is the control of prices and the general cost-accounting system which we had to develop in order to safeguard expenditure. In the earlier part of the statement of evidence I give the reference to my being put in charge and establishing Sir Hardman Lever and a number of other gentlemen in charge of this business and obtaining adequate powers for dealing with it. That matter is indicated in paragraph 13, and in the exhibits I give chapter and verse by way of one or two illustrations as to the enormous economies which arise out of the establishment of that system and refer *inter alia*, in paragraph 22, to the powers that we obtained in the Munitions of War (Amendment) Act, which gave us the authority to deal with costs and prices.

Then paragraphs 62 to 67, shall I say, merely summarise what has gone before. These paragraphs are rather important in one other respect—in considering what should be the extent of the state manufacture. Whatever the system may be, one has to consider what it is you mean by “munitions of war” and a rough classification is indicated in those paragraphs. In paragraph 62 you will see that I speak of “products manufactured for, and only for, the purpose of war” and I call them for the sake of convenience Group A, because one knows that you are bound to consider the practical question as to where you are to stop, or where you are to begin. I suggest there that, for these purposes anyhow, it is practical, and we found it entirely practical, to make a sufficient distinction, and I think the definition there suggested would be found to be a useful working rule, and to be good enough. It is true that cast iron, which is used on the outside of a bomb, is used for tens of thousands of purposes, but a bomb full of explosives is not; it is only made for one purpose, and that is war. Then there is Group B, referred to in paragraph 63, which presents more difficulties when you are prescribing the extent to which the state supply department should be responsible, and perhaps I might just read three or four lines.

575. Chairman: If you please.

Dr. Addison: “In another class there are supplies of a lethal type, such as some explosives and certain chemicals which are used in industry and are also of a type required for war purposes.

* Appendix, pp. 134-5.

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

It should, however, be remembered that some explosives required for war purposes are different from those required in industry. These will be referred to as Group B." Of course, in this branch of supply it is much more difficult to draw the line than it is anywhere else, and perhaps you will ask me questions later when I come to the specific recommendations as to what I call the establishment of adequate reserve supplies. Of course, we know that certain explosives, for instance, are used and manufactured for ordinary commercial purposes, and as such would be identical, perhaps, with explosives that you might put in a shell; but in fact the explosives that are used in many munitions, anyhow, are in a different combination from those used for other purposes, and the proportion of those of a specialised kind that you require for war explosives is different from that which you require for peace-time purposes. One illustration I give of that—in paragraph 37—is the enormous disproportion in the type of sulphuric acid which is required for war purposes and for ordinary commercial purposes in industries. The acid is, as to the bulk, required in the more *dilute* form, but for the manufacture of explosives in war the balance of requirements was completely altered, and the bulk required—not the whole, but a very great mass of manufacture of that type of thing—was in the *concentrated* form of acid, for which purpose we had to build special works, and that balance is different from peace-time requirements in any case. For those kinds of reasons I think that the government department concerned should supply itself or supply the state with such of the specialised mixtures and types as are required for the establishment of its war supplies and the reserves that are indicated. For the rest, or, at all events, most of the rest, the system which I have indicated in the conclusions would be, I think, adequate. You would not need for this purpose to expand your manufacture or control into the great variety of chemical manufacture which ordinarily goes on for commercial purposes.

But there is one exception—I have not, of course, given it in detail in this public paper—and that is the material and the highly specialised types of experiments for which we had to be responsible connected with gas warfare. That in any case, I would suggest, must be reserved to the department.

576. *Sir Thomas Allen*: I did not quite catch the conclusion of your last sentence.

Dr. Addison: I was saying, Sir Thomas, that in any case the type of material and manufacture of compound mixtures which are, or were, or may be, used for this type of thing, namely, chemical warfare, clearly form a readily definable class used for war purposes only—that would be Group A—and should therefore be completely reserved for state control. That is the point.

Then there are other materials referred to in paragraph 64 which affect the classification. I give you one or two examples which we use in war and in peace equally in that form—glycerine, alcohol, and a dozen more things. I do not think, so far as the state manufacture of munitions is concerned, that it would be necessary to extend into that field at all. These are the three main groups which, I suggest, have to be considered.

In paragraphs 68, 69 and 70 I present a summary in specific form of the reasons for the failure of private manufacture and for the failure of the system of sub-contracting, which I think is very important, and perhaps I might be asked about that later. That is in paragraph 69. Then in paragraph 70 I deal with inadequacies of the system with regard to labour, machinery and materials. Then in paragraph 71—

577. *Chairman*: Now you come to give your definite recommendations?

Dr. Addison: That is right.

578. *Chairman*: May I suggest that you should read those, if it meets your view.

Dr. Addison (reading):

71. It appears to me to be undoubted that the experience of the late war points not only to the desirability but to the necessity, from the point of view of national defence, of the establishment of a state department responsible for the manufacture and assembly of all munitions of war strictly so-called. I mean the articles manufactured for, and only for, the purposes of war which I have previously referred to as Group A" (paragraph 62). This conclusion is entirely apart from the grave considerations of national policy relating to the undesirability of manufactures of this kind being in private hands for the purpose of gain.

72. There should, I suggest, be a single supply and manufacturing department for all war departments, the following being some of the more prominent considerations:—

(1) There were numberless instances of the difficulties, and sometimes waste, which arose out of different service departments seeking to obtain the same materials as well as machinery at the same time. Because of those difficulties the supply of materials and machinery became progressively concentrated in the Ministry of Munitions. The advantages of unified responsibility are manifest, where imported supplies are concerned.

(2) The disorder and possible waste and loss to the efficiency of supply are equally cogent in the case of manufacture either in national establishments or by private firms. The overlapping of orders and divided responsibility in the case of aircraft supplies is a striking example.

(3) Similarly great economies as well as improvements in manufacturing efficiency are obtainable through a costings system under unified and experienced direction. The difficulties that arose between the Ministry of Munitions and the Admiralty over cordite prices, of which details can be supplied if desired, furnish an illustration of the losses that may arise from divided responsibility.

(4) The processes of transport, assembly, inspection and filling are those in which unless there is unity of direction there must be unnecessary delays and disorder.

(5) The work of design and experimentation is inseparably associated with that of manufacture and supply, and, as the evidence has shown, serious difficulties and delays occurred during the first year of the work of the Ministry of Munitions because design had not been associated at the start. The records of the Inventions Department of the Ministry (which can be supplied if desired) are a good example of how an alert central department can be directed to make use of and develop not only the suggestions of its own experts but those which come from outside—I hope you will ask me about this later—The cases in which this department assisted to bring up to a workable form suggestions often of quite humble people were very numerous. There were some thousands of cases great and small. It is certain that had it not been for these arrangements very many useful ideas would never have been made use of. The case of tanks referred to by Sir Eustace D'Eyncourt—who was himself the chief designer in the Admiralty—is an example of how a central department (the Ministry of Munitions was responsible for tank supply) was able to make use of and provide facilities for the development and perfection of outside suggestions. The Stokes mortar is an other example.

(6) There is a final and most important reason for the existence of such central department as is here suggested, namely, that only by such an

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

agency would it be possible to mobilise and secure the rapid utilisation of appropriate private manufacturing capacities to provide expansion in the case of war. This consideration calls for suggestions as to how such a department would operate.

73. (1) The department would be responsible in peace time for the supply and manufacture in state-owned factories and establishments of all war munitions indicated in Group A (paragraph 62), and for all manufactures relating to chemical warfare that might arise in Group B (paragraph 63), and for such others as circumstances or new developments might bring into the category of productions for war use only.

(2) It would manufacture and store such reserves as might be deemed necessary. The number of months of prospective war use which such reserves would be designed to cover would be conditioned in different cases by the rapidity with which supplies could be augmented in the event of war by the increase of state manufacture or by the mobilisation of the resources of appropriate private manufacture.

(3) In the case of some specialised types of machinery it would probably be found desirable also to establish certain reserves for expansion purposes in the state factories since private manufacturers could not be expected to maintain them—I hope you will ask me about that—.

(4) With regard to explosives referred to in Group B, it would, I think, suffice if the state department manufactured the specialised supplies used in chemical warfare and only such explosives as were required for its peace time activities and for reserve supply. For expansion in time of war, it should have appropriate arrangements with private manufacturers, who normally produce allied products for a great variety of civil industries.

(5) The department would require to take and keep sufficiently up-to-date records of the quantities, types and location of such machinery and materials as might be required for different purposes.

(6) It would prepare and have available sufficient supplies of drawings, specifications, gauges, etc., as might be necessary to facilitate the expansion required.

(7) It would have in readiness an appropriate classification of private establishments and be prepared with the necessary control orders in respect to them as well as in respect of materials supply.

579. *Chairman*: Is there anything more you would like to say before we ask you some questions upon what you have said?

Dr. Addison: I think it will really emerge in answers to questions.

580. *Chairman*: Very well. There are one or two questions I want to ask in reference to what I may call the historical part of your statement. First of all, with regard to some statements in paragraphs 62, 65 and 68. With regard to paragraph 62, you there indicate that, in your view, for the purposes of the consideration which you desire to put before us, you classify munitions into Groups A and B, but have you in your own mind considered what would fall within Group A and what would fall within Group B and the practical difficulties connected with the considerations arising under those heads?

Dr. Addison: Certainly, I have considered that. I think the definition in Group A is sufficiently explicit; it would be a good guide. Clearly all the types of trench warfare supplies used for the purpose of war, tanks, machine guns, and guns of every kind, obviously come within that definition. I quite agree with you, Sir, that there would inevitably be margins everywhere, which would have to be dealt with in a practical spirit; but I feel quite sure myself that practical sense could easily cope with

them. It is perfectly true, shall we say, of trousers, that a man wants trousers in war of different colour and different material, it may be; but, still, a civilian wants trousers, and I should not describe khaki trousers as munitions of war; they are not used for purposes of war only, but bombs are.

581. *Chairman*: Are you familiar with the proposed convention for the suppression of international trade in arms and munitions, which has been put forward by the American representatives?

Dr. Addison: I have seen it, but I should like it recalled to my mind.

582. *Chairman*: They classify munitions and implements of war under different categories.

Dr. Addison: Yes, I know.

583. *Chairman*: Are you prepared to accept their view?

Dr. Addison: I would not answer that question without notice. I should like to study their view a little more carefully. I am quite sure that good sense would arrive at a practical working definition, but, of course, I should have to refresh my mind as to what that particular recommendation is.

584. *Chairman*: We have had a good deal of evidence and discussion as to articles which, in their initial stage, in their innocent stage, would not be lethal, and there is a question as to at what point they become lethal. Now, take a ship or an aeroplane; into which of your Groups A or B would you put those?

Dr. Addison: The building of warships I should put into Group A, because you do not build a submarine except for the purposes of war; therefore those you would build in Admiralty yards. A ship, however big, is after all built in pieces, with armour plate and guns and every imaginable form of equipment. Whilst the manufacture of the ship or the assembly of the parts into the form of a ship is clearly Group A, there will be many pieces that go into that ship (we will say the chairs in the cabins, and a hundred other things) which I should not regard at all as coming within the definition of Group A; you would obtain them in the usual way; but the manufacture of the thing as a ship in a shipyard, wherever you get your bits from, that is Group A. I should have said. Aeroplanes, I agree, present a much greater difficulty, but so far as an aeroplane is designed and manufactured for military purposes, then it should go into Group A. It is true that ships and aeroplanes used for civil purposes, and built and designed for civil purposes, could no doubt readily be adapted to war purposes; one has to recognise that; but I should not necessarily, for this purpose, put that into Group A, any more than I should the building of a merchant ship. After all, we took merchant ships and we readily adapted them to various war purposes, just the same as we could a civil aeroplane, and they are quite parallel cases; but I should not put the building of merchant ships into Group A or the building of civil aeroplanes into Group A. I think it would be perfectly practical to make a distinction. It is true you might have similar parts in it, but you have to face up to these practical difficulties and deal with them in a sensible way.

585. *Chairman*: There is another matter about which I want to ask you, and that is that you have emphasised in your statement the saving of cost which resulted from, first of all, being able to check the prices that were charged by the private manufacturers, and also by the setting up of a costings system. Of course, in considering this matter as a whole, one has to set off, has not one, the saving such as that which was effected under the organised system and the increased cost that there would be to the state by adopting the suggestion you have put forward of nationalising the manufacture?

Dr. Addison: I am afraid I cannot accept your suggestion, Sir. I do not think there would be increased cost, for this reason: Take a simple case like machinery; you see, the idea—quite sincerely held—that you would get the expansion you require

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

by keeping alive, say, a certain potentiality of manufacture by private firms, is, I suggest, based upon an inadequate consideration of what is actually involved. You see, you cannot expect a private manufacturer to establish and keep a machine (often a very expensive machine) unless that machine is being steadily used; you could not expect him to keep a machine idle half the year—a great and complicated plant. The cost of keeping that machine must, quite properly, increase his overhead charges; that is the only way the man can deal with it, and quite fairly; whereas if the state itself erects that machinery for turning out its requirements you do not have anything like the same machine waste as you have by scattering over a number of different places machines that are only inadequately used. That must be so. Therefore I demur a little to your suggestion, Sir, that it is necessarily more expensive. It depends on what you mean.

586. *Chairman*: It does not quite meet the difficulty which was in my mind. I am only thinking over these things, but one has to assume the possibility of war.

Dr. Addison: Yes, of course.

587. *Chairman*: One hopes that it may be very very remote. Assuming that the state takes over the whole of the manufacture of the necessary munitions of war, it will manufacture and store, and when it has manufactured all that it thinks is possibly necessary for store, what is to happen? Is it to shut down or is it to keep the establishment going? If it is to keep the establishment going and somehow employ the men, that is where the additional expense to the state comes in, to my mind.

Dr. Addison: I suggest it is a difference, shall I say, if it is a difference at all, of *locus*. It would be, of course, for those in charge of this business to design a practical programme which would be spread, as far as may be, over the whole period of a year. It is true that the time might arrive when the state had manufactured and stored an adequate reserve of shells, we will say, or of guns, or whatever it was. Well, the machine that made the guns—if at that time it had ceased to be used in the state factory because, we will say, they had all the guns they required for their reserve—would be idle, it is true, unless some alternative use, which is very unlikely, could be designed for it; but if that machine were in private works it would also be idle, and therefore I suggest it is only a question of where your specialised plant is situated. If that specialised plant is not being used, then it would necessarily be idle; but one has to remember that, spread over a large number of different shops and firms, as it necessarily is, you are bound to take into account the exaggerated overhead charges which those firms must necessarily be involved in. If you refer to Exhibit C—Sir Hardman Lever's report to me of the 24th January, 1916—you will see that he gives there the reasons for the high establishment charges, the reasons why the firms themselves set up their very high prices.

588. *Chairman*: That rather bears upon what is troubling me. Under existing conditions, when this was published the private firms were carrying all that expenditure?

Dr. Addison: That is right.

589. *Chairman*: But under your system, or under an entirely altered system under which it would be nationalised, it would be the state which is carrying that?

Dr. Addison: No; excuse me. The state pays for it to the private firm all right, because the state pays so much more for the products—it's armour plate or Maxim guns, or whatever it is which it gets from the private firms—but those costs are put by the private firm into the price which the state pays. The state pays it in another way, that is all.

590. *Chairman*: But the state only pays an excessive price when it wants the article which the

firm is manufacturing; it has to keep the establishment going up to a certain state of efficiency, whether there is war or whether there is peace?

Dr. Addison: That is true; but I suggest to you that the facts show—I am not blaming them for it at all; it is a fact, and they are bound to do it as business men—that the firms put on to their price a very adequate margin for those overhead charges. That, if distributed over a large number of different firms, they necessarily exaggerated the overheads which the state had to pay for in its supplies. Is it true that the state might have to maintain an establishment in which some machinery would be idle, but it at least would be concentrated. 591. *Sir Philip Gibbs*: At the present time, under the present system, you see, these private manufacturers have other markets than the national market, and that is why they are enabled to keep the plant going.

Dr. Addison: That raises another question. If you look at Exhibit C, paragraph 5 (b) (1),† you will see there that Sir Hardman Lever and his friends dealt with that very point. The firms alleged that they had to support in some cases a costly, world-wide selling organisation, and that is why they put the price that the government had to pay so much higher; so that we paid it in the long run, although it was indirectly.

592. *Chairman*: There is one other point which has been put to us in reference to this particular point by some of the witnesses, and I should like to ask you your view about it; because they say that one of the difficulties in the way of nationalisation—and assuming that there is to be no emergency for a long time—will be the difficulty with labour; that if you have a large staff of labour to commence with, when you have completed your stock what are you going to do with your labour?

Dr. Addison: I suggest that a practical problem of that kind is one which would necessarily be dealt with by a sensible consideration of all that was involved. We have to remember that if you have labour employed on a job in one shop, and that particular work comes to an end, that does not necessarily mean that labour cannot be used for something else.

593. *Chairman*: It cannot be used in a national factory for anything else.

Dr. Addison: Yes; but may I come to the point?

594. *Chairman*: I beg your pardon; yes.

Dr. Addison: One has to remember that some of these supplies are more urgent than others, and you have priority, and you would necessarily design the spread of your labour not only with a view to producing what you require now, but also having in mind the priority of importance of your requirements. In some you could spread the work over a longer period. Those things which could be made quickly would not be required so soon. I suggest that that necessarily would involve a successful adjustment of your labour distribution according to your programme, spreading it as well as you could. I think that in any case, seeing the enormous advantages which would arise from the concentration, the labour waste (and it is clear there must be some) would necessarily be less, because instead of this being distributed over lots of other places you would have it more manageable and you could use it for various purposes, as we found.

595. *Chairman*: In the case of a long peace there must come a period, and in every conceivable re-arrangement of labour there comes a time, when in every department you are fully stocked up, and then what is to happen?

Dr. Addison: Naturally, in a prosperous time of that kind, let us hope that other industries would readily absorb your labour, but that absorption would apply whether the goods were made in private factories or whether they were made in a government factory.

* Appendix, pp. 120-2.

† Appendix, p. 120.

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

596. *Chairman*: It is easier for a private firm to say to a man, "You can go," than it is for the state, is it not?

Dr. Addison: Yes, it is; but, at the same time, you have to remember that the state must necessarily maintain its key men, and it has to face up to the importance of doing so. I myself, from my experience, do not think that when a state enterprise comes to an end it has any more difficulty in disposing of labour, or that they stand a less chance of getting a job than other people. When a state builds something, whether it is houses or guns, it does not make any difference as far as that is concerned; when the job is done the labour has to—

597. *Chairman*: I was thinking of the trouble (in some of the documents we have had before us) that there was at Woolwich, when there was a proposal to discontinue Woolwich.

Dr. Addison: Yes, of course that is so, and it would be so in any case. That was the question of moving Woolwich, but I think that your difficulty of unemployment is only in the one case more readily vocal than it is in the other. The man ceases to have his job whether the thing is being made in a private factory or in a state factory; it makes no difference. In the one case he can make his grievance more readily listened to, perhaps, but he is out of his job all the same. As far as the quantity of labour is concerned, it is only the distribution that is altered.

598. *Chairman*: You understand that I am only putting these matters to you because they are difficulties which have been presented to us either by other witnesses or by the documents?

Dr. Addison: Yes. May I just make one observation before we leave this point? I am quite sure that the bulk of labour requirements, in the light of the output you are planning, in the case of concentrated management such as I am suggesting—with the utilisation of labour under proper management, of course—would be much more economical; you would not require such a big floating amount of labour to draw upon, some of which was periodically unemployed and some of which was not. I think that on the whole, with successful management, your labour strength for the same production would be considerably less if the management was concentrated, and therefore the possibility of waste would be diminished. I am quite sure there would be an enormous increase in the use of labour in the production of goods.

599. *Chairman*: One other question about the historical part of your document, and that is the contrast that you make between the failure of the private firms to fulfil their contracts and the fact that Woolwich was able, apparently, to supply all that it contracted to supply. From the point of view of the private firms, I assume that they met the difficulties that you indicate in your memorandum—the difficulty of getting labour, the difficulty of getting material, and the difficulty of persuading private firms to let them have their men, and so forth—and on top of that, of course, the demands were quite exceptional, whereas in the case of Woolwich they had not those difficulties and their contract was a comparatively small one?

Dr. Addison: Well, Woolwich had not the same difficulties in one sense, because it had an established experienced personnel concentrated upon that type of work.

600. *Chairman*: That is it.

Dr. Addison: But, if I may say so without wishing to be unkind, the reason why Woolwich more than lived up to its promises was that it only made promises in accord with what it thought it could do; whereas what happened with the private firms was that they undertook deliveries which, directly the engineers examined their capacities for production, they reported without exception that they should not have undertaken, because they could not manufacture them even if they were going on all the time. The reason, if I may so, why Woolwich

had a better record—I am not wishing to suggest any unkindness, it is just as it happened—is that Woolwich surveyed its promises with a strict regard to its productive capacity, whereas the private firms—I am not blaming them—made their promises with regard (a) to their own productive capacity, and (b) to what they thought they could get by sub-contracting or other outside methods. It was the other outside methods and all the rest of it which were unfortunately far from being realised, and they made promises in other cases beyond what they could fulfil. I suggest that that involved the state in serious danger, because it relied upon promises which were not sound promises.

601. *Chairman*: I was going to ask you some questions now upon your conclusions, if I might, beginning with paragraph 71. Is the foundation of your proposal that all private manufacture of munitions of war (using that in the widest sense) is to cease?

Dr. Addison: In Group A, yes. I think that all Group A should be under state manufacture.

602. *Chairman*: And that means that it must be stopped; private manufacture must be stopped. How do you propose to stop it? Do you propose to compensate the private firms, or are you proposing merely to refuse to give them the orders and forbid export?

Dr. Addison: In the first place, may I say that the evidence I put before you was deliberately restricted to what I myself had experienced. I thought that would perhaps be more valuable. Therefore I did not go at all into matters which had not specially come within my own first-hand experience. So far as this evidence is concerned, it is designed to show that I am fully satisfied that as a method of the state supplying itself with what it requires in munitions of war, this reliance on private manufacture is a bad method and has proved to be bad, and so far as the state's requirements are concerned, that the method which I suggest is the one we ought to adopt, that conclusion being based upon the evidence of what I myself know. I have deliberately restricted myself to that side of the case. I quite recognise, of course, that the other consideration will have to be dealt with.

In reply to your question I will say what I think about that. In the first place, I am quite sure it would be entirely impracticable for the state suddenly to close everybody down without compensation. That would not be done; it is not fair; and therefore it is perfectly true that at the commencement of a system of this kind it would be necessary, probably, if shops were taken over, that some of them should be taken over for the time being in the transitional stage for state use. Some could be adapted or would be adapted, as we know, and were at the end of the War, for many other purposes, and it would be necessary, of course, to deal fairly and squarely with the different matters concerned. It would be difficult, but it would have to be dealt with. The same issues arose in connection with the transfer of work—I am now taking the point of the cessation of manufacture by private firms—at the end of the War, and I myself, in a set of experiences that do not come into this evidence, was Minister of Reconstruction, and it was my business as such to be in charge of the various groups which were concerned in drawing up our programmes for the resumption of peace-time activities and the cessation of war-time activities, and we had to elaborate armistice programmes for the alternative of either summer or winter cessation of war. This possibility of the use of private firms' equipment for other purposes was considered in great detail. There was some very valuable evidence by engineers and others on the matter. I know for myself, because I had two or three conferences with representatives of one or two of the leading manufacturing firms, and we

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

did help to get them post-war orders of a kind for which their machinery was appropriate and to which it could be adapted. The same kind of good-will and assistance would necessarily have to be applied in a case of this kind.

The manufacture of orders for other countries is a much more difficult question. With regard to the transfer to the state, provided you recognise that you are going to wipe out a man's good-will and business, of course, you have to pay for it. That is part of the price, and you as honest people have to pay the price. So far as the international side is concerned it is rather more difficult, and relates to international conferences and understandings. I suggest that in any case it would be much easier to deal with the international issues that are involved if the control of the supply were in the first instance in state hands and you were not embarrassed all the time by the dozen and one cross currents of interest which you would have to placate or deal with if you were trying to deal with it under the existing system. There would have to be an international convention, I suppose, so long as this kind of supply went on, for the supply of states that were not able to supply themselves. That is the only way in which it could be dealt with, but in any case it would be easier to deal with it if you had the thing under your command in the first instance than if you were dealing with it with a hundred and one separate agencies each clamouring around you as to how they were being affected by what you decided. I believe myself that it is impossible—practically impossible, anyhow—to deal with the restriction of supplies fairly to outside interests under the existing system (assuming you could refuse to give a licence); but it would be very difficult to operate with fairness.

603. *Chairman*: There is only one other matter I want to ask you about, and that is under subparagraph (6) of paragraph 72. You are there contemplating expansion, and you say: "There is a final and most important reason for the existence of such central department as is here suggested, namely, that only by such an agency would it be possible to mobilise and secure the rapid utilisation of appropriate private manufacturing capacities. . . ." What are you visualising there under the heading of "private manufacturing facilities" when all private manufacture of armaments has been stopped?

Dr. Addison: That is a matter of great importance. You see, the point I am making there is that the system here envisaged enables you to obtain the more rapid expansion that you require or may require, because, as is set out here, one of the chief obstacles to rapid expansion through the reliance upon private firms, apart from what was in their own works, was that the system of sub-contracting very largely broke down. It broke down for various reasons: first, the sub-contractors preferred to deal with the state if they could; second, the parcelling out of orders to sub-contractors or for sub-contracting was very much delayed, often because the firms wanted to see what they could do themselves in the first instance; third, it was held up because sub-contracting in any case depends upon an adequate supply to the manufacturer of gauges, specifications, drawings, and all the rest of it, which the private manufacturer had not in quantities. Naturally they had gauges for their own requirements, but they did not make a lot of spare gauges for other people; you could not expect them to do so. For those and other reasons set out in paragraph 69 the system of expansion by this existing system proved to be quite inadequate. Now, I suggest that the only way in which you could mobilise and use private manufacturing facilities is by a system of this kind. Lots of machines say could be used for turning a piece of a fuse or a piece of a shell—it requires adjustment in the machine, various jigs and what-not are introduced—but there was no matter on which our experiences

were more convincing than the claim that there was some special art or mystery behind this kind of manufacture. Any expert or competent manufacturing engineer can turn his machine to the manufacturing of this or that with complete readiness provided he is supplied with the necessary specifications, materials, drawings, gauges, and the rest of it, and he could just as well make a part of a fuse as he could a piece of a sewing machine or anything else. By taking the census of machinery referred to in the next paragraph (paragraph 73). . . If you look at (5) and (6) and (7) in paragraph 73 you will see this statement, namely: "The department would require to take and keep sufficiently up-to-date records of the quantities, types and location of such machinery and materials as might be required for different purposes. It would prepare and have available sufficient supplies of drawings, specifications, gauges, etc. . . ." That means that the central department would have, of course, or should have anyhow, an adequate statistical side with all these various essentials kept up to date, and by the distribution of them amongst the private manufacturers who are manufacturing all sorts of things now, but who could readily be turned to manufacturing war materials as they were—

604. *Chairman*: May I interrupt for a moment? I only had in my mind as to whether you had any specific private manufacturers in mind. If it simply means anybody and everybody who can lend a hand, I follow.

Dr. Addison: Not quite that. You see, your classification of private manufacturers will be in groups. There are certain manufacturers (and there would clearly be) whose machinery and equipment and all the rest of it would be more adapted for manufacturing A rather than B, and your classification would be designed to make use of that. But by having your classification and all the rest of it available you could readily bring into production all that great mass of productive capacity which is scattered and now being used for other purposes.

605. *Chairman*: Yes, I follow. That is all I think I want to ask you.

Dr. Addison: Apropos of that will you look at paragraph 46. You will see that we had to deal with that very difficult matter quite early on. We had to take a census of machine tools, machinery, and so on, straight away, and we found a lot of machinery which could be used advantageously for our manufacturers which was either not being used, or standing idle, or perhaps being used for something else. That census of machinery and machine tools, and all that went with it, as a matter of fact did more than almost anything else in the early days to enable us to open up the scattered manufacturing capacities which existed up and down the country and which was closed to us until we had obtained that information and the powers of dealing with the machinery, and so on. Perhaps I might on that say a word about gauges. This is dealt with in paragraph 51. I may tell you that a shortage of gauges, and people who could use them and make them, perhaps delayed the Ministry more than any other one thing. It depends on what it is; but, as you are aware, a thing like a fuse is made of a very large number of different parts fitted together—complicated little pieces of mechanism—but each one has to be gauged to an extremely fine point of accuracy. The person who manufactures fuses has his stock of gauges and that is all. We could not use private manufacture for lots of vital articles for quite a time because we had not got the gauges which were necessary for their use and we had to mobilise all sorts of people such as jewellers from Hatton Garden, and so on, who could make gauges and who could work to that degree of accuracy which is necessary for the production of gauges, master gauges, and so on. There is perhaps no branch of the work of a central department such as I have mentioned which plans

19 June, 1935.]

The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

ahead for the possibility of expansion which is of more importance than this particular provision which is referred to in paragraph 73 (6), namely, an adequate supply of drawings, specifications, gauges, etc. It would be a very important branch of the duty. It is indeed the only way in which you could open up the scattered manufacturing capacities of the country, and it was one of the reasons that it was not the business of a private firm to make an extra supply of gauges—you could not expect them to do it: they are expensive things—

606. *Sir Kenneth Lee*: Surely Woolwich might have done it before the War?

Dr. Addison: Yes, so it might.

607. *Sir Kenneth Lee*: It could do it now in preparation.

Dr. Addison: Yes. Your central department would have to have them made. That is my point; but so long as Woolwich has to rely on someone else to do it your hope for the expansion could not in fact materialise. The point I am making is that the only way to obtain expansion is for your central department to make them, and it must keep a supply. Woolwich or anyone else could have done it.

608. *Sir Kenneth Lee*: Woolwich is the state. The state could have been prepared.

Dr. Addison: Yes, but it was not, because it relied upon this other system.

609. *Professor Gutteridge*: It could be done under our present system, surely?

Dr. Addison: Certainly; you could have a great state supply of gauges and specifications clearly.

610. *Professor Gutteridge*: It is a matter for Woolwich Arsenal as things are now.

Dr. Addison: I would not like to say whether I would make them at Woolwich; I should require to look into the details of that as to whether Woolwich would be a suitable place.

611. *Sir Kenneth Lee*: Gauges could be made by the state in anticipation without it setting up this organisation which you have in mind.

Dr. Addison: Yes. There would have to be some central department for design, inspection and testing, otherwise they would not know what they wanted. You must remember a gauge denotes that you know what it is you are going to gauge; in other words your specification must be precise and all that goes with it; it all hangs together; inspection, design and all that hangs together because, after all, the gauge is only the ultimate expression of what you are going to gauge.

612. *Chairman*: Complete preparation on the lines you have just been suggesting might be possible and you could still maintain private manufacture of arms if you wanted to.

Dr. Addison: Of course you could supply gauges.

613. *Chairman*: It is not necessary to abolish private manufacture in order to be completely prepared from the point of view of design, or gauges, and all the rest of it.

Dr. Addison: So far as the limited purpose of the supply of gauges is concerned, clearly not. You could have a state manufacture, or state supply of gauges specifications and drawings, and so forth, in what abundance you desired without doing the other; but, of course, the other is dealt with in other parts of the evidence for other reasons. But my only point is that that is an essential part of your machine and it is essential to rapid expansion. That is all.

614. *Dame Rachel Crowdy*: I have read your memorandum, which is extraordinarily interesting, and I may say it brings to one's mind a great deal of horror in remembering the early days of the War. In paragraph 15 you say there was a saving of £400,000 a week, when you changed to government manufacture from private manufacture. Then in paragraph 16, where you give a description of the discussions with Nobels on the price of cordite, and later in other paragraphs when you speak of the

tragic failure and you talk about the situation which can only be described as chaos, I feel you really draw a picture in connection with private manufacture which must give pause to the people who feel that we cannot give up private manufacture because of the security of the nation. You have made, I think, a very strong case, if I may say so, for national control, or, rather, national manufacture rather than private manufacture; and I do feel that your memorandum rather differs from others which have been put before us up to the present time because it really is based on fact and not on fancy or ethics or a cause of disarmament or peace, or whatever it may be; therefore it makes a great impression on me personally.

Dr. Addison: I can assure you I have not exaggerated it.

615. *Dame Rachel Crowdy*: I am sure you have not. In answering the Chairman just now you spoke of the great unpreparedness of private manufacturers when War broke out implying a false guarantee of security, and that the Government was not prepared because they were relying on private manufacturers. Do you believe under your system which you propose that needs such as the needs of 1914 could have been met immediately in the way they were not met by the private manufacturers? I should like to get that clear in my mind.

Dr. Addison: I am quite sure they would have been met much more rapidly. I should not like to say immediately. May I say that "unpreparedness" is not quite the term I would use. You see I say it is not fair to ask a private manufacturer to retain out of use capacity which he is not ordinarily using in the course of his business. You cannot expect him to do it; it is not fair to ask him to do it. I say the incapacity for expansion, such expansion as was required and might be required, is inherent in the system because you cannot fairly expect a man to expand that way; it means keeping a lot of stuff idle. I am only making that comment with regard to your expression "unpreparedness". I say it is the inability which is inherent in the system; it cannot expand as it was required to expand. Then in answer to your last question I am quite sure that if we had had a Ministry of Munitions at the beginning of the War we should certainly have been better equipped sooner than we were. It was only after nine months of misery and struggle that we started doing it. We should have got there sooner; how much sooner, of course, I could not say, but we should certainly have got there a lot sooner.

616. *Dame Rachel Crowdy*: I was also very much interested in paragraph 72, sub-division 5. You have probably read Sir Eustace d'Eyncourt's evidence at a previous hearing of this Commission, and you realise that he and you are in complete opposition to each other?

Dr. Addison: I do.

617. *Dame Rachel Crowdy*: Because he said conditions in government service are such that they have not the same chance of developing the inventive capacity of which they are capable, and later he says his experience shows that that attitude exists widely in various departments of the government service. You probably read that yourself.

Dr. Addison: I did.

618. *Dame Rachel Crowdy*: "It does not make for great improvements or help inventive genius." You say exactly the opposite; you say the records of the Inventions Department of the Ministry are a good example of how an alert central department can be employed to make use of and develop not only those inventions which come from its own experience, but those which come from outside. I should be grateful if you could expand that a little.

Dr. Addison: Certainly. There are two matters. First Sir Eustace d'Eyncourt was himself, as you are well aware the chief adviser at the Admiralty, and he himself, with Mr. Churchill, at that time was very largely responsible, with others, for the initiation of the tank idea. I think Messrs. Fosters of Lincoln—

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

619. *Professor Gutteridge*: Do you mean the agricultural machinery people?

Dr. Addison: That is right. It was a firm with experience of that type of caterpillar manufacture which was brought in to help in the manufacturing side. As the thing developed, the so-called Tank Corps got established, which, after various troubles, which I need not recite, was transferred to the Ministry of Munitions; shall I say it was said at the time that we gave it a home? It is because we, the state department, gave it a home and placed at its disposal the manufacturing capacity which was at our command that it could develop the tank and did develop the tank. It is true that Sir Eustace d'Eyncourt very largely inspired it.

620. *Professor Gutteridge*: It was made at Thetford, was it not?

Dr. Addison: The main parts were made at Lincoln.

621. *Professor Gutteridge*: What was done at Thetford in that heavily guarded area there—do you remember?

Dr. Addison: Perhaps I might ask for notice of that question. I will bring up the details if I am coming again on Friday. I understand I am coming again on Friday, if necessary, and I will look up the papers.

622. *Professor Gutteridge*: There were a good many people concerned in that.

Dr. Addison: Yes, there were. As a matter of fact, in the manufacture there were only three or four of us who knew what was being done; it was a very carefully guarded secret. I myself do not know now, until I hunt it up, how the orders for parts were distributed; but I may tell you it was done with the greatest possible secrecy. I think the most vital parts were done by Messrs. Fosters, who very heartily co-operated with the department, but the point I am making in reply to Dame Rachel Crowdy's question is that you could not have a better illustration than the tank provided, in fact, of how an alert department placing at its disposal the manufacturing capacity at its command did give a great opportunity for a new idea. Honestly, although I had to do with it from the very start, it was a certain group of people at the Admiralty—I know Mr. Churchill was very helpful, and Sir Eustace d'Eyncourt was one of them. That is a good case, if you want one, where an idea was developed by the co-operation of a central department making use of the capacities of private persons. Now take the other part of the subject, and if it will be of interest I shall be glad to supply a report which was made to me by Sir Ernest Moir whom I appointed to be the head of the Inventions Department. The reason why we established an Inventions Department was because we found a thousand and one suggestions—or at least it was claimed (I will put it that way)—for good ideas were not getting a fair chance. Sir Ernest Moir and others with him formed the Inventions Board, and we deliberately said: You can send all your suggestions; where they are good they will be helped and developed, and if they are adopted you will get credit for it. Well, I need scarcely say that at first we had a great deal of chaff and we had to look for the wheat. That is what you would expect; but after a short time that stage was got through, and in Sir Ernest Moir's report on the year's working of the Inventions Department you will find they adopted, or modified, or made applicable, a very large number of suggestions which had come from all kinds of people and which were embodied in fact in the war machinery.

623. *Professor Gutteridge*: Who were those people, roughly speaking?

Dr. Addison: I think it would be better if I sent you the report.

624. *Professor Gutteridge*: I was only asking the question for this reason; there were people other than civil servants, I take it?

Dr. Addison: Hardly any of them were civil servants—foremen and men in works—they varied from people like Sir Wilfred Stokes, who is himself the head of a very large and important manufacturing concern, down to the humblest workman, and, of course, which is natural, all kinds of ideas were showered upon these gentlemen which they had to winnow as best they could. But they did winnow, and the point I am making is that after they got the system in working order, in fact it enabled large numbers—not a few—of people to get suggestions adopted and used, who, under the existing system, would never have won through at all, and the evidence is abundant in proof of it. I know they got through. It is true that we hear a lot about departmental red tape. That does well for certain newspapers, who know nothing about it; but it depends how you run it.

625. *Chairman*: Yes; but you are rather convincing me that you agree with Sir Eustace d'Eyncourt because a great many of these things which were turned into valuable inventions came from outside government departments.

Dr. Addison: Yes, but—

626. *Chairman*: Wait a moment; and when they came to be utilised they were not utilised by a government department in the ordinary sense but a very special department of munitions that was dealing with matters not from the ordinary government point of view but from the point of view of an outsider.

Dr. Addison: Yes; but the point I am trying to make—and I will send a copy of this report because I think it will convince you—is that those suggestions never could have been used. That is my point.

627. *Chairman*: Are not we dealing with two different things. You are saying the advantage of the Munitions Ministry enabled them to be dealt with.

Dr. Addison: The establishment of this organisation, yes.

628. *Chairman*: Yes, and that, according to Sir Eustace, would be a treating of the matter from the point of view of a layman rather than from the point of view of a civil servant.

Dr. Addison: After all, what is a civil servant. 629. *Chairman*: I am not saying which is right; I am only saying you are gradually bringing yourself into the same category as Sir Eustace.

Dr. Addison: I am glad we think alike; I did not realise it by his paper. I thought we thought quite differently. My point is this, that a department of this type proved to be necessary to enable good suggestions to be examined and made use of. 630. *Sir Philip Gibbs*: Do you think a state monopoly of manufacture would have the same open mind?

Dr. Addison: If the head of the department had not, he ought to be replaced by someone who had. That is all.

631. *Sir Philip Gibbs*: It is not a psychological question?

Dr. Addison: Not at all. I was the head of a department. It depends on whom you have got there. Sir Ernest Moir had his specialised committees that examined these things and some of the members were civil servants and some of them were other people.

632. *Chairman*: I think we are travelling away rather from Dame Rachel Crowdy's question.

Dr. Addison: I thought Dame Rachel Crowdy was asking me why I feel that a central department of this kind is necessary, successfully conducted of course, in order to give a proper chance for inventions, and so on, to be used. Was not that your question, Dame Rachel Crowdy?

633. *Dame Rachel Crowdy*: I can imagine in war it would be very much as you say, but war, after all, erupts invention, does it not?

Dr. Addison: Of course.

634. *Dame Rachel Crowdy*: But in peace time if you have an inventor going to a private manufacturer would not there probably be more money available,

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

and more quickly, than there would be if he went to a central government department where, after all, you have to think of the government budget and go through a good many departments before permission is given for anything to be done at all.

Dr. Addison: No, I do not. I am sorry to say you will find these records show that under existing conditions the man with an idea has a very small chance; the number of cases that were turned down either because the man had to go through his foreman or to go to someone else or cases in which the ideas got lost—

635. *Dame Rachel Crowdy:* Or his idea might be bagged.

Dr. Addison: Yes, it might be bagged by someone else, and having seen an idea of his mate's bagged by someone else he does not put his own forward. The evidence was overwhelming as to the extent to which that kind of handicap exists, and it certainly does. Sir Ernest Moir, or the Inventions Department, got shoals of suggestions of that kind and a good many, I do not say without modification and a lot of experiment, ultimately proved serviceable, quite a lot. I know there is so-called red tape and departmental expense. The point I am on is, if you have a department or a section of a department that is set aside to do its job, it will be to the interest of the men (call them civil servants or whatever you like who are running that department) to make a success of it, just as much as it would if they were running any other department, and if the head is not a successful man then he ought to be replaced by another head. That is all.

636. *Sir Kenneth Lee:* In paragraph 65 you make a very strong case against the private manufacture of arms by the failure that occurred up to the end of May, 1915, the failure in delivery; but we have had figures that do not seem altogether to give the same kind of picture.

Dr. Addison: These are accurate figures; that is all I have to say.

637. *Sir Kenneth Lee:* May I point out that in the five pre-war years the ordnance factories supplied £1,600,000 worth odd of gun ammunition, and private manufacturers only supplied £560,000 worth odd. The ordnance factories therefore supplied three times the amount that was supplied by the private manufacturers during those five pre-war years. From the outbreak of war up to May 29th, 1915, the ordnance factories delivered 314,000 rounds of gun ammunition, whereas the private manufacturers delivered 825,000 rounds of various kinds, so that in that period private manufacturers produced two and a half times as much as the ordnance factories. From those figures it would appear that after the outbreak of war the private manufacturers did exceedingly well compared with the ordnance factories.

Dr. Addison: It depends what your system is. The system there, you see, was not to enlarge your ordnance factories but to obtain your requirements from the private manufacturer. That was the system.

638. *Sir Kenneth Lee:* Before the War?

Dr. Addison: It was the system then.

639. *Sir Kenneth Lee:* No; but before the War the ordnance factories produced three times the amount that the private manufacturers produced.

Dr. Addison: The amount was trivial; but when the War started—the last figure you gave was the War months, was it not?

640. *Sir Kenneth Lee:* Yes, up to the end of May, 1915.

Dr. Addison: That is right. During that period the system which was adopted was to rely upon the private firms to give the supplies required by their expansion and not by the expansion of the government arsenal. That was the system, and if you will look at the last paragraph of paragraph 6 of my statement of evidence you will see that although it is perfectly true that the private firms supplied

owing to that system a great many more than they had done before, because their orders had been so prodigious, in fact there were 1,500,000 deliveries against promises of 5,700,000; in other words, they had let the state down because the system was to rely upon that method of expansion rather than upon the other. The fact that during those nine months they struggled up to 800,000 is neither here nor there. They promised 5,000,000; and for the reasons I have set out they could not deliver them. They never will under that system; it will not work.

641. *Sir Kenneth Lee:* Turning to another point, you have said a good deal about the inelasticity of the present system. Is not there also a danger if you had the manufacture in the hands of one department that there would be greater inelasticity?

Dr. Addison: I recognise the danger which has to be guarded against, of course, and we ourselves had a good many struggles with the experts, but you would have them anyhow. That is why it is that in paragraph 73 I say it would be the duty of the department to make certain provisions—1, 2 and 3—for the purpose of rapid expansion, my idea being that that rapid expansion would take the form to a large extent of the utilisation of the appropriate private manufacture which is the great field for expansion in any case.

642. *Sir Kenneth Lee:* Yes, but it would be in peace time that the spade work would require to be done.

Dr. Addison: Certainly.

643. *Sir Kenneth Lee:* And do not all these things depend upon individuals in the end?

Dr. Addison: It also depends upon the system. Of course after all you must have competent management whoever does it. But it depends on the system. If you have a department charged with, say, classifying the firms that are capable of manufacturing this, that or the other, with a census of the appropriate machinery properly catalogued; with a proper supply of gauges, specifications, drawings and all the rest of it; with a proper system of arrangements made beforehand for controlling orders and for bringing into the scheme certain groups of private manufacturing capacities; if that is prepared, as it could be, and as it ought to be for this purpose, then I am suggesting that is a piece of the business of the department, and that in any case it is only in that way that you could get the expansion—you cannot get it any other way, not quickly—and that, therefore, someone should be made responsible for seeing that it is done. That must be a state department.

644. *Sir Kenneth Lee:* But those sorts of things could be done without manufacturing the whole of one's requirements by the state.

Dr. Addison: Certainly a lot of them could, of course—drawings and specifications; but for other reasons I am only saying that is a wasteful system, keeping this other machinery partly employed in private firms. It does not work.

645. *Sir Kenneth Lee:* There seems to me to be a great danger of your falling behind if you are going to rely on one department to produce all the implements of war for all the different requirements.

Dr. Addison: There is much less danger of your falling behind if some body of people are made responsible for it than there is if you have the responsibilities scattered and ill-defined as they are at the present time. We certainly fell behind, when we were put to the test on the existing system, in a very tragic fashion.

646. *Sir Kenneth Lee:* I have tried to show that it was not quite as tragic as your memorandum depicted.

Dr. Addison: Well, I was there.

647. *Chairman:* May I ask this again: Assume you have a complete and proper organisation from the point of view of expansion, would not the organisation be better able to expand quickly if it had private manufacturers of arms to call upon than

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

if there were no such firms and recourse had to be to the ordinary engineer.

Dr. Addison: No, not necessarily. You see there is no magic—we have to get that out of our heads altogether—attached to the manufacture of a machine gun any more than there is to the manufacture of a sewing machine.

648. *Chairman:* Except that they have the plant.

Dr. Addison: But under my system the state would have the plant to manufacture its requirements. They have certain machines and you know where they are.

649. *Chairman:* But then are you assuming that the state will have enough machines and that it will not want any more?

Dr. Addison: No.

650. *Chairman:* If it wants more it is surely in a better position if it has only to go across the road, as it were, to people who have them already.

Dr. Addison: No; we will take machinery.

651. *Chairman:* The ordinary engineer will not have all the necessary machine tools.

Dr. Addison: A lot of them will be available somewhere. When you have a machine which is capable when ordinarily used we will say for making bicycle parts, or sewing machines, or anything you like, you will find that certain types of machine are suitable for the manufacture of this or that part of a war production; it only requires a very rapid adjustment to get it so used. The point I am making is, having your classification ready, with your machinery for invoking its rapid use ready, that is a better way of getting a bigger expansion than by expecting, which would never happen, a private firm to have a number of highly specialised machines, kept idle, because they will not do it, and you cannot expect them to do it; it is not fair.

652. *Dame Rachel Crowley:* Is not the trouble that they are not kept idle.

Dr. Addison: That is another matter, but a lot of the machines are, because a machine can be readily adapted for making different things. That is my point. Might I put this* in? This is a good case because it gives you an illustration of the kind of contractors whom we found were useful for making this that or the other. If you, Sir, and your colleagues will look at the end under "Metropolis" you will see the kind of thing I am now talking about which was very widespread.

653. *Chairman:* The trouble is that, assuming you put an end to the private manufacture of arms, you would only have all those people to call upon; they would be in existence.

Dr. Addison: They are not manufacturing arms now.

654. *Chairman:* But they would all be available to be called upon.

Dr. Addison: Certainly.

655. *Chairman:* Very well; but in addition you would have these people who have been manufacturing arms; would not that be a help to expansion. I quite agree with you that they will not be in existence if you are not going to allow them to export.

Dr. Addison: No.

656. *Chairman:* But if you allow them to export it seems to me—and I cannot see how it can be otherwise—that, under your system, if you get a complete organisation you must be in a better position to meet the emergency the more firms you have to call upon—the more there are the better.

Dr. Addison: That is true, but the engineering capacities of this country are immense, as we found, and if you have a system where you rely to a greater or less degree upon private manufacture you necessarily and in consequence rely upon that system

quite properly—it is the only way to use it. It is true that if you have firm A making machine guns for someone or other, or for yourself, in peace time, that if you have them in existence when a war begins, there will be so much more capacity—that would be so—but the point I am suggesting is that for the purpose of obtaining your supplies it would be better that you yourself had that capacity, and that in fact seeing that war productions, except in the more highly specialised cases, like big guns, we will say, are a type of manufacture for which there is an immense wealth of available material in our country which can be mobilised quickly, that the right method and the most expeditious method is to have your capacity of manufacturing on your own, with, of course, your own capacity for expansion, and to rely for your expansion on the mobilisation under the system here indicated of others rather than to rely upon them to be responsible for your supplies in peace time.

657. *Mr. Spender:* In fact the whole tenor of your evidence suggests that the state would have a far bigger permanent establishment with regard to armaments than most of us have ever contemplated at the cost of a large expenditure of capital and the keeping of very large reserves of labour. If the state is to keep clear and avoid all the troubles which you have rehearsed to us, that would be necessary, would it not; it would be a very formidable undertaking?

Dr. Addison: No. It would be, if I may say so, nothing like as expensive as the present. You are paying for it now; you are paying for it through someone else's account.

658. *Mr. Spender:* May not we put this point of view: that the payments in the matter of overhead charges, so long as these private firms are allowed to export, are divided between a good many countries and governments, and it seems *a priori* very improbable, if one country takes it all upon itself, that it can do it more economically. Your theory—

Dr. Addison: It is not a theory. Take whatever manufacture you like; after all, it is in terms of goods you want to produce when it gets down to brass tacks. You want 100 shells, or 1,000,000 cartridge cases, or 1,000 machine guns, or whatever it is. It is a more economical method of producing those things to have a factory, and so forth, equipped for that purpose and used for that purpose, than it is by paying extra overhead charges to half a dozen different people. You are paying for it all the same, and it is not going to add any more on your estimates. It will be a good deal less, as a matter of fact, because they will cost less. Take Exhibit D—the record of the meeting I had with the big firms on the 31st January, 1916—"He"—(Dr. Addison)—"said that the actual costs of production in government factories have been definitely ascertained" and certain gentleman here mentioned "urged the point that the cost of production was very much greater in an old-established firm than in a small new factory erected for one special purpose and that there were special charges, e.g., for experimental work, gun ranges, submarine testing stations, which should be taken into account." Then they went on later to talk about their overhead charges. That is so, but you are paying for it now, extra, in half a dozen or a dozen different places, and my reply to you, Mr. Spender, is that that necessarily is more expensive than if you are making it under this system for yourself.

659. *Mr. Spender:* You put before us the dangers of there being a war without sufficient power of expansion. I am not wanting to make a point dogmatically, but the getting of that power of expansion by the state, if it is to do what you suggest in your evidence it ought to do, would almost inevitably be more expensive than if the power of expansion is spread over a good many countries, as it is as a matter of fact?

* The witness handed in a confidential Report prepared by the Ministry of Munitions.

19 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

Dr. Addison: All I have to say is that if this country is to rely upon the support of this system of manufacturing its supplies in times of war upon the precarious obtaining of orders from other countries in peace time, then it is going to rely—

660. *Mr. Spender:* I am not speaking about war time.

Dr. Addison: I am not; I am talking about peace time.

661. *Mr. Spender:* The Inquiry, as I understand it, is not so much concerned with war time. I think we should most of us agree with all that you say about control in war time; it is only how to get the best reserves and the best machinery for expansion at the least cost in time of peace.

Dr. Addison: I think it is undeniable that the reliance upon firms who manufacture or seek to manufacture for overseas markets—the suggestion that that so spreads your overhead that it is better for the state—that is your inquiry?

662. *Mr. Spender:* Yes; in time of peace.

Dr. Addison: Yes. I suggest that the evidence shows that it is not so; that the firms, quite necessarily, in undertaking that type of manufacture, have to have very large overhead charges, and, as they themselves urged to me in this paper here quoted, they have to support in some cases a costly, world-wide selling organisation. So they have, and the expense of that world-wide selling organisation with all that goes with it comes in the long run on the price of the supplies. I suggest to you, Mr. Spender, that the suggestion that the state is getting it cheaper because of that is not in accordance with the facts. It is not getting it cheaper; it is paying more.

663. *Mr. Spender:* That must be more or less a speculation, must it not?

Dr. Addison: Well, of course; and a very big speculation. They do not know whether they are going to get orders from Bolivia or not.

664. *Mr. Spender:* I am not defending the system.

Dr. Addison: I know you are not. I am not expressing an opinion about it; I am only saying what it necessarily involves in cost.

665. *Mr. Spender:* It is not merely orders for munitions that these firms get?

Dr. Addison: No.

666. *Mr. Spender:* They are using their labour for a great many peace purposes which also spread the overhead charges?

Dr. Addison: That is true.

667. *Mr. Spender:* So it is not very easy.

Dr. Addison: But you cannot get away from the fact that that system necessarily involves, and, as firms quite properly claim—I think it is a fair claim—a very big extra expense to maintain that selling organisation. But if you take a thing like (3) in paragraph 5 (b) of Exhibit C, the unemployment of armour plates or armour rolling plant—expensive plant of that kind—it is a very prodigious addition, and must be, to their overhead charges. You are paying for it; you must pay for it, and it is not cheaper to do it that way.

668. *Mr. Spender:* You have been talking of your experience of 1914, when munitions were something which were static. Was not one of the difficulties in 1914-15 that the War was developing all sorts of new emergencies and new weapons, and you could not get the soldiers to decide upon what kind of munitions or guns they wanted? The argument went on all through the autumn and winter of 1914 and the spring of 1915 between shrapnel and high explosives, and when we speak of storing munitions and having reserves of them, does not that mean constantly storing all the time?

Dr. Addison: There is bound to be a certain amount of that, anyhow. I do not think that the

demands for new developments became so pressing in the sense to which you are referring until about the middle of 1915. The arrears of demands which gave rise to the trouble in the autumn and the winter of 1914 and the spring of 1915, which led to the establishment of the Ministry of Munitions, were the inability to obtain stock supplies which had been forecast before, which were not new in type, although in some cases with regard to shrapnel and high explosives the proportions between the two were different from anticipations, that is true, but, still, it was the same type of shell. The trouble at that time was the deficiency and the inability of the supply—what you might call the stock supplies. The new thing arose later, and I think there is no doubt that if there should be such a calamity as another war you may be perfectly certain that the form of demand will be different and that there will be lots of things which no one anticipates. You cannot help that, anyhow.

669. *Mr. Spender:* If you look at either the French or the German or the Russian results of 1915 they all tell the same story?

Dr. Addison: They do indeed.

670. *Mr. Spender:* All out of guns, munitions, rifles, etc.?

Dr. Addison: Yes; but that situation in Russia applied all the time. So far as France and Germany are concerned, it developed during 1915.

671. *Mr. Spender:* It was a little earlier, was it not?

I am speaking rather from memory; you have all the details in Lord Kitchener's "Life." I think December, 1914, was one of the critical months?

Dr. Addison: There was a controversy between the use of high explosives and shrapnel, which went on sporadically for a long time; but so far as this particular case is concerned—shrapnel shells, 18-pounders, or high explosives—these were the things which had been specified; they were not new things; and the point was whether this was the best method of supplying them or not.

672. *Mr. Spender:* There was a great controversy as to the safety of the various kinds of high explosives?

Dr. Addison: There was indeed, and it went on for a long time. We did not get over those difficulties until really well into 1916, but no one can be blamed for that. I am afraid that sort of thing is inseparable from anything which is new. It is neither for nor against private manufacture; it is just something new.

673. *Mr. Spender:* I am only suggesting there is no system which is watertight.

Dr. Addison: No. That is why I particularly attach so much importance to what I have stressed about design and invention, and all that. I think it is very necessary that you should have an alert central organisation capable of making use of what it can obtain outside.

674. *Mr. Spender:* How long do you think it would take, if it were decided to change over to state manufacture, to buy out or compensate the firms and make new arrangements?

Dr. Addison: It depends upon who handled it and how it was handled. I should have thought, speaking without detailed consideration in answer to your question, perhaps a year or so; perhaps a little longer, a couple of years, but not a long time.

675. *Chairman:* It is now time for us to adjourn and I understand you cannot come this afternoon?

Dr. Addison: I am sorry.

676. *Chairman:* Could you come again on Friday morning?

Dr. Addison: Yes.

677. *Chairman:* Because I think that some of my colleagues have questions to put to you.

Dr. Addison: If you please, Sir.

(Adjourned for a short time.)

[For continuation of Dr. Addison's examination, *vide infra*, p. 100.]

19 June, 1935.]

Lord DAVIES OF LLANDINAN.

[Continued.]

On resumption:—

Lord DAVIES of Llandinan, representing the New Commonwealth Society, called and examined.

678. *Chairman:* Lord Davies, you have been good enough to come and offer to help us. You have prepared a statement which we have in print. You realise that it deals with some matters from one point of view, or perhaps several points of view, which are not directly material to our Inquiry, but at the same time they bear upon the questions which we have to consider, and I was wondering what would suit you best. If you would like to read your state-

ment that would be quite convenient and acceptable to us.

Lord Davies: In the first place, may I thank you, Sir, and the Commission for kindly allowing us to place this evidence before you. I represent the New Commonwealth Society, which is an international body, and this memorandum has received the approval of the executive committee of the international section and also the majority of the members of the British Committee of the Society.

(*The witness read the following statement.*)

Aims and objects of the New Commonwealth.

1. The New Commonwealth is an international society which endeavours, by means of research and education, to influence public opinion in Great Britain and other countries to secure the establishment of the reign of law in international relationships. Its basic principles are:—

(i) That a durable peace can only be founded upon the concept of justice.

(ii) That the reign of law in international relationships will never be realised until,

(a) a peaceful procedure has been evolved to revise treaties and to adapt the public law to the changing needs of the international community,

(b) adequate sanctions—financial, economic and military—have been provided to enable the international authority—the League—to vindicate the supremacy of the public law.

From these principles we deduce the necessity for the establishment of two institutions as part of the permanent machinery of the League;

(i) An equity tribunal empowered to settle all disputes, including those arising out of the revision of treaties, which defy settlement through the existing procedure of negotiation and conciliation—the Assembly and Council of the League—or of judicial processes—the Permanent Court of International Justice, and

(ii) an international police force to maintain order and to uphold the decisions of the authority.

By insisting upon the necessity for the establishment of these complementary institutions—an equity tribunal and police force—the Society endeavours to harmonise the dynamic principles of peaceful change with the static principle of security in international relationships.

An International Police Force.

2. The idea of an international police force is not new and throughout the centuries it can be traced back to the days of the City States of Ancient Greece. From time to time, distinguished statesmen and publicists—Sully, Saint-Pierre, Rousseau, William Penn, Kant, Castlereagh and Theodore Roosevelt, to mention only a few—have proposed the pooling of national military resources for the purpose of establishing an international sanction. During the last twenty-five years, discoveries and inventions, and the application of science to the art of war, have produced a number of super weapons, for instance, submarines, tanks, poison gas and aeroplanes, thus increasing immeasurably the potential power of destruction of every national war establishment in comparison with the pre-war era. We propose that by applying the principle of differentiation of weapons, it will be possible to transfer to the custody of the international authority, these super weapons, thus conferring upon it a superiority of force expressed in armaments and equipment rather than in huge armies and mass formations. Under this arrangement, the national military establishments would still retain such forces and pre-war weapons as are deemed necessary for policing their

respective countries and dependencies abroad, and as the first line of defence, for the protection of their frontiers against an aggressor. In the event of an attack, these forces would be immediately reinforced by the international police force just as the constabulary are reinforced by the forces of the Crown in the event of riots and civil disorder. The strategical location and distribution of the international police force would depend upon the number and geographical position of states members of the authority. Its main preoccupation would be to protect them against acts of aggression by non-member states. Participation in this collective system on terms of equality would be open to the latter whenever they desired to join the ranks of the authority. The international police force would therefore be a highly specialised and centralised force manned by a relatively small personnel of fully trained experts and under the direct control of the authority. This brief description is intended as an introduction to the following suggestions dealing with the supply of armaments and munitions for the maintenance of such a force which, if they were adopted, would render nationalisation unnecessary and enable the existing sources of supply to be utilised for the sole purpose, not of making war, but of suppressing it.

Disarmament.

3. In its advocacy of these objectives, the Society is not directly concerned with the policy of negative disarmament. Our aim is to concentrate public opinion upon the necessity for “the enforcement by common action of international obligations.” (Article VIII of the Covenant.) We believe that when an effective system of collective security has been established—the reign of law—disarmament will automatically follow, because no longer will any nation co-operating with others in the establishment of this system have any inducement or motive to maintain huge and costly armaments of its own. Thereafter the defence of each will be merged in the defence of all, whilst the experience of every civilised community demonstrates that “centralised force tends to eliminate all force, including itself.”

Purpose of armaments.

4. It follows that the Society is chiefly concerned, not with the methods and conditions of armament manufacture, but with the purpose for which armaments are required and their ultimate destination. We maintain that, wielded by an international authority in the exercise of the police function, they will become the custodians of peace and the guardians of justice. On the other hand, under the exclusive control of sovereign national states they will continue to be used as the instruments of international duelling, thus perpetuating the ancient practice of trial by battle. The New Commonwealth asserts that the only right or moral use of armaments is the policing function.

Private manufacture.

5. We regard the private manufacture of armaments under the existing international system as pernicious, for two reasons:

(a) because in the present state of international anarchy the immediate interests of

19 June, 1935.]

Lord DAVIES OF LLANDINAN.

[Continued.]

armament firms are served by fomenting and stimulating international rivalries and jealousies, which ultimately lead to war. We need not elaborate this point because it has been exhaustively dealt with in the evidence already submitted to the Commission;

(b) because the motive of private gain or profit is an inducement to armament firms to supply weapons to other nations, which in the event of war may be used against the forces of their own country.

Therefore, under existing conditions, the private manufacture of and trade in armaments, is an adjunct of competitive national war establishments, and of the duelling system. If this anarchic system is to be allowed to continue, we believe that its effects will be aggravated by the private manufacture of armaments. Therefore, so long as these conditions exist, we would urge the nationalisation of all armament manufacture and trading, though we are not convinced that this change will in itself result in any appreciable limitation of armaments, or that it will entirely abolish the abuses to which we have alluded above. In short, we regard nationalisation merely as a palliative measure, which may help to diminish the incidence of war.

Competitive war establishments—the root cause of war.

6. Moreover, even though armament production is nationalised, the elimination of private profit will not prevent war being regarded as an instrument of policy. Further, there will be no guarantee that surplus stocks will not be sold by governments to other nations,* or that the small states will not become the vassals of the Great Powers upon whom they will be dependent for supplies of war material. Therefore, in our opinion, the root of the evil lies, not in the method of manufacture or trading, but in the existing system of competitive national war establishments. Until this is replaced by a collective system, mankind will always live under the menace of war which, in the twentieth century, means the threat of complete annihilation and the destruction of civilisation, at any rate in Europe.

Co-operative armament versus competitive armaments.

7. We would therefore venture to submit that the urgent need of Europe, and specially of Great Britain—owing to its vulnerability to air attack—is the establishment of a collective system of security which, in its development and organisation, means the creation of an international police force under the control and direction of a neutral authority—the League of Nations.

Further, we believe that if such a development can be achieved, the existing methods of manufacture of armaments, both public and private, could be fitted into the new system with the minimum of dislocation and expenditure. The effect would be to limit the demand for armaments to one customer—the League. Under such an arrangement government factories and armament firms would be precluded from supplying their munitions to any country or government other than the authority controlling the international police force, subject to such conditions and modifications as might be agreed to

between the states members of the authority, for the supply of weapons and ammunition required for policing purposes in their own territories at home and overseas. This would mean substituting co-operative armament for the existing system of competitive national armaments, and it would obviate the two objections to private manufacture and trading mentioned in paragraph 5. It would remove any incentive on the part of the armament firms to stir up rivalry and foment trouble because they would be bound by their contract with the international authority to refrain from supplying weapons to anyone else. Moreover they would no longer be under the stigma of supplying armaments to other nations which could be employed to slaughter their fellow-countrymen.

The only conceivable exception would be an act of aggression committed by a state member against one of its neighbours which would compel the authority to employ its police force in defence of the state which was being attacked and to bring hostilities to an end. This would be analogous to the case of individuals in every civilised community who contribute to the cost and equipment of a police force which may be used to arrest or restrain them should they be guilty of acts of violence against their fellow citizens, or commit a breach of the law.

Sources of armament supply—no moral considerations involved.

8. Assuming that the states members of the authority are prepared to recognise that the exclusive purpose of armaments is the policing function, and that they are willing to constitute a joint force under the control of the authority towards the maintenance of which they will jointly and severally contribute, then it follows that the armaments and equipment of such a force must be supplied from some source or another. It is clear that no moral considerations are involved so long as these armaments are employed for one purpose only, namely, international policing, and their ultimate destination is the international authority. It therefore seems to us immaterial from what source or sources they may be derived. Consequently it becomes a question of expediency as to whether they are produced by

- (i) international manufacturing establishments under the direct control and supervision of the authority,
- (ii) national establishments under the control of individual states members,
- (iii) private armament firms situated within the territories of the co-operating states members.

Should international authority establish its own munition factories?

9. It is clear that the weapons transferred to the international police force will require to be replaced as the original stock handed over by states members of the international authority becomes obsolete. In certain eventualities it may even be necessary to increase the supply if, for instance, the states which remain outside the authority decided to embark upon a new competition in armaments in defiance of the reign of law and in order to impose their individual will upon the federal authority. It is anticipated, however, that if a sufficient number of states combine at the outset in establishing the authority it may be able to reduce the contents of its arsenals, and thus obtain a considerable measure of disarmament followed by a still more comprehensive reduction when the non-member states decide to co-operate in the new system.

But, however great these reductions, there will always be the need for the replacement of old and useless weapons and for the replenishment of the stocks of ammunition. The authority may occasionally introduce a new weapon and it may improve

* Evidence that this practice exists at present is contained in a letter from Captain John Ball, Director of the Soley Armament Co., Ltd., to the American Armament Co. in which he claims to be a contractor to the War Office and "really the sole selling channel for small arms, etc., which belong to the British War Office." The letter continues "The stocks we control are of such magnitude" (valued at approximately £6 millions) "that the sale of a big block of them could alter the political balance of power of the smaller states." (Minutes of Evidence of Commission Investigating Munitions Industry in the United States, Part 3, page 672, exhibit 256.)

19 June, 1935.]

Lord DAVIES OF LLANDINAN.

[Continued.]

upon its original types. It may be forced to do so by the action of non-member states, and in these circumstances it would be compelled to undertake a comprehensive programme for the improvement and modernising of its armaments. Consequently, provision would have to be made in the organisation of the international police to meet this contingency. But unless it is faced by competition from outside, the tendency will be towards stabilisation, followed by reduction, and the policy of replacement will be limited to those weapons which are fit only for the scrap-heap. As a result the "expectation of life" of each species will be prolonged.

Nevertheless, the problem of manufacture and supply both of weapons and ammunition, will still remain. The international authority might undertake the task of repairs, but without incurring enormous costs it could not become directly responsible for the manufacture of renewals. Repairing workshops might be established at the unit, continental and headquarters bases, but the production of a new ironclad, tank or gun would be clearly outside the range of its activities, and might lead to endless complications and unnecessary expenditure.

The authority and its states-members.

10. The authority bears no comparison with the individual sovereign state. It does not possess vast territories upon which to erect its factories for the production of battleships, submarines, tanks, artillery, poison gas, etc., nor can it command the services of a highly industrialised population for the supply of its requirements. It must perforce fall back upon the resources of its individual states-members as the means of replenishment. If the latter have handed over their super weapons, they can be trusted to produce the necessary replacements and the stocks of ammunition. Such an arrangement would obviate the enormous expenditure entailed by the erection of new factories especially in neutralised localities or small states where the cost of manufacture would probably be excessive, whilst the confidence displayed by the authority in the loyalty of its states-members would give them a direct stimulus in maintaining the armament and equipment of the international police.

Spreading the risks.

11. Moreover, the concentration of the entire production of weapons and ammunition in a few centres and huge factories under the control of the authority might constitute a serious menace to its security. To any recalcitrant state-member or hostile non-member, these centres would become the decisive points. If they could be placed *hors de combat*, the superiority of the international police would be seriously endangered, if not destroyed. Acts of incendiary or sabotage directed against these munition factories might deprive the authority at one blow of its vital supplies.

On the other hand, if it is not dependent upon any one source for its replenishments, it may draw upon the resources of all its states-members. If any Great Power assumed the role of the aggressor or endeavoured to paralyse the authority by cutting off its supplies, the latter would be able to fall back upon the other powers to make good the deficiency. Thus the policy of spreading the risks would be infinitely less dangerous than one which aimed at concentration under the authority. Consequently it is not proposed that the manufacture of arms and equipment for the international police should be undertaken by the authority.

Aircraft factories an exception.

12. To this general rule, it is suggested there may be an exception, and it relates to the unique position of aircraft as a policing agency and the necessity of improving this new arm of the service in order to increase its potency and efficiency.

Consequently, it may be found desirable to establish several aircraft factories under the control and direction of the authority and specially designed for the construction of fighting machines and bombers. These factories would concentrate their activities in developing the military type of aircraft, which might tend to become more and more distinct from the commercial air vehicle.

In the sphere of aviation new types follow one another in rapid succession. These factories would, therefore, become centres of research and experiment contributing to the advance of aeronautical science.

It is held in some quarters that the fighting 'plane will become the decisive weapon of the future, and that superiority in this arm will be the dominating factor in any struggle. Whether this view can be substantiated or not, few people will deny the importance of the military aeroplane and the necessity of maintaining its superiority in speed and "performance" over the commercial 'plane. The authority should not be entirely or exclusively dependent upon the efforts of national aviation factories of states-members or of private firms in improving the existing types and models. The fact that it would possess a monopoly of the fighting 'planes should not prevent it from exploiting this advantage by increasing the speed, range and efficiency of these machines.

The authority need not depend solely upon its factories for even the bulk of its requirements. We have seen that this would be a mistaken policy. But in a matter of such vital importance, it could not afford to rely entirely upon the initiative and enterprise of national governments or private firms whilst the dual source of supply could not fail to be an advantage.

Rationing of orders.

13. Let it be assumed, however, that with this exception, the authority relies upon its states-members for the provision of weapons and ammunition, that it rejects the alternative of direct manufacture and purchases its requirements from the existing sources of supply. This system, however, has its drawbacks, against which safeguards should be provided in the treaty. The general considerations bearing on this point are as follows.

Firstly, the armament orders should be rationed out as far as is practicable amongst all the states-members. This proposal, of course, does not mean that every state-member will be allotted its quota irrespective of other factors, such as costs, distance from the police bases, capacity of production and other circumstances, which should be taken into account in the distribution of the orders. It is clear that in most cases the requirements could only be supplied by those nations which have attained a high standard of industrial efficiency. Each state-member which can demonstrate its ability of ministering to the needs of the authority should, however, be entitled to its share of the orders.

No monopolies.

14. Secondly, the orders should be distributed in such a way that no state-member or group should be able to secure a monopoly in the manufacture or production of any weapon or species of ammunition required by the international authority. At least, all the Great Powers should be included in the allocation of orders for vital necessities. It is clearly essential that no national government should be placed in a position which would enable it to paralyse the activities of the international police by holding up their supplies, or to exert pressure on the authority by even threatening to do so. If each of the Great Powers participates in the manufacture, limited in extent and defined in the treaty, of these supplies, the security of the international police will be assured and the danger of a monopoly will be removed.

19 June, 1935.]

LORD DAVIES OF LLENDINAN.

[Continued.]

The production of chemical materials may be cited as an instance. At the conclusion of the War there were 25 kinds of poison gas, and since then several new varieties have been added to the list. It is essential that all these chemical compounds should be manufactured in factories situated in the territories of each of the Great Powers, thus ensuring to the international authority adequate and alternative sources of supply. Before the War Germany possessed a practical monopoly of these materials owing to the fact that her industrialists had captured the trade in chemicals, and had organised the industry on a monopoly basis. As a result she succumbed to the temptation to use the products of her dye and allied industries for war purposes. The arrangement described above will remove this temptation in the future. It will rest upon the unassailable basis of being directed against no state in particular, but against any nation which violates its treaty pledges.

The Bareme formula.

15. Subject to the above considerations, it is suggested that the orders for the supply of armaments and munitions should be allocated to states-members on the basis of the Bareme formula, which governs the contributions now paid by states-members towards the cost and maintenance of the League. This formula expresses the principle of equality of sacrifice, or ability to pay in terms of annual contributions to the international authority. In other words, it represents the premiums to be paid on the insurable assets of each contributory state. Consequently the same system might fairly be applied in assessing the contributions of states-members towards the maintenance and cost of the international police force. It follows that the allocation of orders for armaments and equipment should be distributed on the same basis, so that states-members who paid the largest contributions would receive their share of the orders for supplies.

Nationalisation of armaments.

16. Under the arrangements outlined above, it does not appear that any advantages would be gained through the nationalisation of the armament industries functioning within the jurisdiction of states-members of the authority. The activities of both state factories and private firms would be restricted to supplying weapons which would be used exclusively for policing purposes, whether by national governments within their own territories, or by the authority for the maintenance of international law and order. State factories would be primarily concerned with the equipment of the forces under their control, whilst the bulk of super weapons would be produced by private firms, as they are to-day, to supply the requirements of the international police force.

The International authority and armament firms.

17. Private firms and factories authorised to manufacture weapons and ammunition on behalf of the international authority should be scheduled in the treaty and licences for this purpose might be granted by the authority and endorsed by the respective national governments. No other firms would be added to the list without the sanction of the authority. Moreover, they would be precluded from selling any weapons to non-member states. The authority would thus constitute their sole customer inasmuch as states-members would solemnly have renounced the right to employ these weapons. They would have voluntarily handed them over to the authority, with the exception of a limited number belonging to certain types required for internal policing, and which should be enumerated in the treaty.

Direct contact with the authority.

18. The further point arises as to whether the authority should deal direct with the munition firms

or whether the orders should be transmitted through the national governments. Probably the former method would be the simpler plan and would avoid possible complications, red-tape, and delay, once the allocations for replacement had been agreed to by the states-members. Such an arrangement would tend to strengthen the relationships between the armament producers and the international authority. The former would be less likely to support their national governments in any chauvinistic policy, preferring the certainty of long-term contracts to the risk of losing their trade connection with the authority. They would realise that in the long run their interests would best be served by assisting the international authority to maintain peace, rather than in bolstering up a precarious system which is bound, sooner or later, to lead to war. They may also realise that in the next war, armament and munition factories will probably be reduced to ruins within a few hours of the outbreak of hostilities.

In the past it has been the practice of a number of national governments to purchase their warlike equipment direct from armament firms in foreign countries. Consequently the proposal that the authority should follow the same procedure does not involve any new principle in the relationships between sovereign states and the armament firms functioning within their jurisdiction.

The future of armament firms.

19. Taking the short view, the immediate effects of the scheme will probably be injurious to the financial interests of the armament firms. The authority will have become their sole customer, and they will no longer be able to exploit national rivalries. Their orders for renewals may have dwindled to modest proportions, and their output will be regulated to meet the needs of the authority. Their trade will be restricted within the limits prescribed in the licences granted under the treaty.

Under these conditions, it is clear that comparatively few firms would be prepared to tender for new constructional work. A business whose expansion had been permanently arrested, and whose volume of trade tended to diminish rather than increase might become incapable of executing even the slender requirements of the authority, unless special arrangements could be entered into, safeguarding the interests of both parties. For instance, the authority might undertake to pay an annual subsidy, or rent, to the selected firms in each country, in return for an undertaking on their part to maintain a specified quantity of machinery and plant, to be placed at the disposal of the authority in case of emergency. The latter might also agree to guarantee a minimum payment to each firm over a period of years, irrespective of the quantities actually purchased. This payment would be merged in the price of the weapons, but would in any case be paid even though the total orders during the period were less than the amount of the annual subsidies. Such an arrangement might be regarded as a guarantee, which would enable the firms to maintain their specialised plant and the services of their skilled mechanics for the exclusive use of the authority. It would necessarily be restricted within certain limits, and would be applied impartially to all the firms scheduled in the treaty.

Compensation.

20. Regarded from a purely business standpoint, it might be a profitable transaction for all the nations concerned to extinguish the opposition of all the armament firms, by paying them a measure of compensation for the loss of business which the creation of an international police would involve. Hitherto they have flourished as part and parcel of the international system. Their enterprises have been fostered by every government, and they have ministered, often unscrupulously, to the needs of every nation. Their services cannot, however, be

19 June, 1935.]

Lord DAVIES OF LLANDINAN.

[Continued.]

entirely dispensed with, and henceforth they can be employed as accessories in the cause of justice and peace.

Never has a more favourable opportunity presented itself of coming to terms with the war-traders. The World War imposed an intolerable strain upon their resources. They were forced to expand their activities in all directions at an unprecedented rate, but on the morrow of the Armistice, they were left high and dry to extricate themselves as best they could from the results of over production and the lavish outlay of capital on works which were no longer required. The universal financial stringency imposed upon every nation not only undermined the prosperity, but even threatened the existence of the armament firms. They have been forced to allow their war departments to lie fallow, and to concentrate upon the manufacture of peace products which have also been adversely affected by the post-war depression in industry. They are passing through a period of reconstruction which inevitably follows after every great war. On the one hand, they may reach a permanent settlement with the authority under which, after providing for its requirements, they will devote their energies exclusively to the arts of peace. On the other, they may tide over the armament depression by developing their peace departments and keeping alive their war factories with small orders which will gradually swell in volume as the national exchequers recuperate and the reaction against war evaporates.

Alternative policies.

21. Here are two alternative policies, and the armament firms may be permanently enlisted on the side either of peace or war. In their present state of mind and under existing conditions they might be willing to treat with the authority, and a mutually advantageous agreement might be reached which will remove this sinister and potent influence from the realm of international relationships. If, however, a settlement is delayed, not only will all schemes of disarmament be frustrated but nations will be engaged in a new and disastrous competition in order to bring grist to the armament mill. The present opportunity should be seized by the states-members of the League to effect a permanent settlement with these powerful agencies. Thus the incentive to stir up international strife, to produce new engines of destruction and to increase the output of munitions all over the world will be removed, at any rate in Europe. Measured in terms of money, no price can be regarded as too high to bring about such a settlement, which can only be achieved through the instrumentality of the authority as an integral part of its scheme for the establishment of an international force.

The air.

22. Whilst the principles and proposals advocated by the New Commonwealth ultimately lead to the organisation of an international police force, armed with all the super weapons which science has introduced during the last quarter of a century, it is realised that such a comprehensive programme can probably only be achieved by stages. Experience may also prove that if military and civil aviation are internationalised, it will not be necessary to hand over other super weapons to the international police. Consequently the immediate objective of the Society is to concentrate upon the problem of the air, and to advocate the establishment of an international air police by the European states-members of the League. The recent air defence pact proposals at least enunciate the principle of international air policing. The idea underlying these proposals is mutual protection, which can only be achieved through a collective system in which the defence of each is merged in the defence of all. The inevitable and logical result of such a policy is an European air police force controlled by a neutral or federal authority—the League.

In order to secure the greatest economy, the best strategical distribution, the highest mobility and the maximum efficiency of such a force, it is essential that it should be directed and controlled by a central authority. It is generally agreed that the menace from the air has now become so overwhelming that the next war will mean mutual annihilation on such a vast scale as to destroy civilisation, at any rate in Europe.

Therefore no measure short of detaching the squadrons of the air from the control of the national governments and handing them over to the custody of the League will suffice to remove a danger of such potential magnitude as has never before threatened the peoples of Europe.

The conquest of the air has introduced a new science and a new industry. It has also brought into existence a new military service and weapon which are likely to become the decisive factors in any future war, and may render other weapons more or less obsolete. Lacking the traditions of the other military services, with its appeal to youth in all countries, besides its mobility and relative cheapness, it will be easier to convert aviation into an international policing agency than any other instrument of coercion.

Moreover, the deterrent effect exercised by an international air police will be infinitely greater than any which can be produced by a combination of the older services. Consequently the proposals adumbrated above for the supply of armaments and munitions to an international police force, comprising land, sea and air services apply especially to the establishment of an European air police. Although the aircraft industry is still in its infancy, it is growing by leaps and bounds, and therefore no time should be lost in moulding its development on international lines, so that it may serve the cause of civilisation, instead of destroying it.

We presume that aircraft manufacturers are patriotic persons who, if they are convinced that the safety of their country and, incidentally of their own factories can best be served through the creation of an international air police force and the internationalisation of civil aviation, they would agree to co-operate amongst themselves and with their respective governments in working out a practical scheme for the supply of aircraft and equipment for such a force.

Therefore we would venture to suggest that a committee of aircraft manufacturers should be asked to study this problem and to submit a plan embodying concrete proposals for supplying the requirements of an European air police. We submit that the first step is to secure the co-operation of aviation experts and aircraft manufacturers in every European country, in framing practical measures for dealing with this urgent matter.

Conclusions.

23. To sum up, the New Commonwealth submits the following conclusions:

(i) That the embodiment of the root causes of war is to be found in the system of competitive war establishments controlled by the governments of sovereign states.

(ii) That the question of nationalisation, as opposed to the private manufacture of armaments cannot be satisfactorily settled until the purpose and function of armaments has been decided and agreed upon.

(iii) That the only right, or moral purpose of armaments, is the exercise of the policing function.

(iv) That the recognition of this principle involves the establishment of an international police force under the control of a neutral international authority—the League of Nations.

(v) That under such a system, provided state factories and private armament firms are precluded from supplying armaments to non-member

19 June, 1935.]

LORD DAVIES OF LLANDINAN.

[Continued.]

states, no moral considerations are involved in the method of manufacture and supply and that consequently the question of determining the source, or sources of supply becomes a matter of expediency.

(vi) That if no such international collective system is evolved and war is still to be regarded as an instrument of policy, private firms engaged in armament manufacture should be nationalised in order to prevent, as far as possible, the abuses of the present system.

(vii) That assuming an international police force is established under the control of an international authority, its armament requirements should be secured from existing sources of supply, and that the authority should not, except possibly in the case of aircraft, become directly responsible for the manufacture of its armaments.

(viii) That the authority should be authorised to enter into contracts with state factories and private firms for the armaments and munitions it requires.

(ix) That as a first step, it is imperative to internationalise the air and to create an international air police in Europe.

(x) That aircraft manufacturers should be invited to co-operate in drafting a plan for supplying the requirements of an international air police force.

679. *Chairman*: Thank you, Lord Davies. We all realise that you have presented a very clear and full case in support of this proposition for the establishment of an international police force. If we do not ask you many, or indeed any, questions upon your proposal you realise that it is because it is not really within our province or within the terms under which we were appointed either to express approval of any particular scheme or to criticise any particular scheme, but to confine ourselves to endeavouring to form conclusions which bear upon the particular terms of our reference. Therefore, I do not propose to ask you any more than a very few questions, in order to make clear to myself exactly what your proposition involves. Assuming the establishment of this international police force, in your view and that of your Association it becomes wholly immaterial to deal with the question of nationalisation as opposed to private manufacture?

Lord Davies: Yes, Sir. We think it is the question of the purpose for which these armaments are required, and not the method of their manufacture, which is the essential point. If they are to be used exclusively for exercising the policing function then we do not think it matters whether they are manufactured by private firms or by state factories.

680. *Chairman*: That is plain. In paragraph 6, where you are talking about nationalisation, you deal with the possibility of states supplying their surplus stocks. Assuming an international agreement to nationalise the manufacture of armaments, have you considered the possibility of states not only supplying their surplus stocks to other states but actually starting as traders themselves? Assuming the private manufacture of arms to be forbidden or stopped, then the manufacture must rest with the states themselves. Have you or your Association considered the possibility of states starting as traders themselves? That is the point that has been made.

Lord Davies: Yes, Sir. I refer to it in the course of, I am afraid, the very long statement which I have read, where I think I describe it in this way, that possibly the smaller states would become vassals of the great powers upon whom they were dependent for their supplies of war material.

681. *Chairman*: It has been pointed out to us that really the nationalisation of the manufacture of armaments might from some points of view be a

greater evil than allowing the existence of private manufacture.

Lord Davies: I do not think I could go so far as to say that. All we try to point out is that it really does not get at the root of the whole trouble; that the root of the trouble, after all, is the purpose for which these armaments are going to be used in the long run, and what their ultimate destination is to be. The mere nationalisation of their production does not mean necessarily that war is no longer to be regarded as an instrument of policy. These smaller countries who are now dependent for their supplies upon the big armament firms would still be dependent on certain governments who would supply them with the warlike material which they required.

682. *Chairman*: In paragraph 20, where you are dealing with the private manufacturers from a business point of view, you say "Their services"—that is, the services of private armament firms—"cannot, however, be entirely dispensed with, and henceforth they can be employed as accessories in the cause of justice and peace". Does that mean, assuming the establishment of the international police force?

Lord Davies: Precisely, Sir. I do not think we would ever suggest that they were accessories of either justice or peace unless they were part and parcel of a policing system.

683. *Chairman*: My last question is this, and it deals with the only part of your statement which very materially concerns us: You realise, do you not, that the main object for which we were appointed was "To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (a) by the United Kingdom alone, (b) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a state monopoly of such manufacture and trade." You know that?

Lord Davies: Yes.

684. *Chairman*: The only piece of advice that you give us that I find is in paragraph 23, clause (ii). There you say that "the question of nationalisation, as opposed to the private manufacture of armaments"—which is the main question we have to consider—"cannot be satisfactorily settled until the purpose and function of armaments has been decided and agreed upon." That means that we had better adjourn *sine die*, does it not?

Lord Davies: Not necessarily, Sir. One cannot help feeling that the question of armaments has now become a very urgent one. People want to know what these armaments are to be used for. They ask, having seen the working of the League of Nations, having become signatories to the Kellogg Pact, having signed the Treaty of Locarno, and other instruments which purport, at any rate, to set up a system of public law in Europe, what are these armaments for, unless they are to be used exclusively and for no other purpose but policing. If the governments were sincere, and carried out the logical conclusion of the commitments to which they have already set their hands, they would adopt a system of this kind. Whether the system would be merely to contribute contingents towards an international police force or to put the force itself under the direct control of the authority is, of course, a question of degree, but the principle involved is perfectly clear, and we maintain, rightly or wrongly, that if such a system can be brought into operation—the French Government have already suggested certain concrete proposals—then it would entirely clear up this question of whether all armaments should be nationalised or not, because that question would have been already solved and it would not make any difference—in fact it would prevent an enormous amount of uneconomic expenditure—if the present system were fitted into an international policing system, and so far as it was

19 June, 1935.]

Lord DAVIES OF LLANDINAN.

[Continued.]

humanly possible to do so you would safeguard armaments from being used for any other purpose than to maintain the public law.

685. *Dame Rachel Crowdy*: At the present time we seem to be quite unable to get an adequate collective system. If we get no international convention—by which I mean an international convention ratified and applied—and if we get no police force of the kind that you suggest, do you then think it worth while to change from private manufacture to nationalisation? I cannot quite make out from your memorandum. I see in your conclusions under paragraph (vi) you say, "That if no such international collective system is evolved and war is still to be regarded as an instrument of policy, private firms engaged in armament manufacture should be nationalised in order to prevent, as far as possible, the abuses of the present system." Then, under paragraph 5 you say, "In short, we regard nationalisation merely as a palliative measure, which may help to diminish the incidence of war." If it can possibly do that it may help to diminish the incidence of war. Is it worth while going through all the blood and sweat required to change from private manufacture to nationalisation? I would like your opinion on that, because I know that you have followed this armaments question closely and are particularly interested in it.

Lord Davies: My answer to that would be that anything which tends to diminish the incidence of war is worth doing—because the next war is going to finish everything—and many people assert that under the existing anarchic conditions the nationalisation of armaments would probably help. That is as far as we can say. That is our case, rightly or wrongly. We think it will help, and anything which helps ought to be carried out. If the governments decide to go on with competitive armaments, if there is no question of pooling armaments as a sanction for international law, then we think the sooner those armaments are nationalised the better.

686. *Dame Rachel Crowdy*: The odds for good are slightly weighted in favour of nationalisation.

Lord Davies: Yes; in order to get rid of all this stirring up of trouble and arousing of international jealousy and discord which undoubtedly is going on all over the world at the present time.

687. *Chairman*: That was a very important question that *Dame Rachel* asked you. When you were answering, did you mean general nationalisation of the manufacture of arms by all the Great Powers or by one single power? Would it affect the chances of war if one single power were to nationalise the manufacture of arms, do you think?

Lord Davies: I think it would be vastly preferable if international agreement could be reached so that all the nations would do the same and each nation would undertake to nationalise the armament firms in its own country.

688. *Chairman*: One realises, of course, the moral influence of a single nation nationalising, but from the practical point of view of increasing or diminishing the chances of war, do you think that nationalisation by one nation would have any material effect?

Lord Davies: I think it would certainly help in that direction.

689. *Chairman*: By example?

Lord Davies: Quite.

Dame Rachel Crowdy: Might I say, Mr. Chairman, that I meant unilateral nationalisation by my question.

690. *Sir Kenneth Lee*: Could you tell us how many members you have in your Society?

Lord Davies: We are an international society. We have somewhere about 1,500 members scattered all over the world in about 30 different countries.

691. *Sir Kenneth Lee*: How many non-British members are there?

Lord Davies: I think about one-third.

692. *Sir Kenneth Lee*: About 500 non-British?

Lord Davies: Yes, roughly. I have not the figures here.

693. *Sir Kenneth Lee*: I was just wondering, because it is important to know what international influence there is behind it.

Lord Davies: We are a very young society; we have only been in existence for about two years. 694. *Mr. Spender*: You speak of the new and disastrous competition in order to bring grist to the armaments mill. You do not mean, do you, that armament firms foment quarrels in order to bring grist to the armaments mill?

Lord Davies: That is, perhaps, an overstatement.

695. *Mr. Spender*: At least the two things go hand in hand. The armaments mill would not go round unless there was a tendency among the nations to competition in armaments. You speak in places about an authority and it would seem that the authority you had in mind was only an European authority, for the people in Europe. The thought occurs to one that, supposing the League of Nations were the authority and were armed in that way by the international police, there would be very important nations outside—the United States of America, Japan and Germany. So you might have one group of states against another group of states.

Lord Davies: Our view is that the first step should be to put the European house in order, because the menace is so much greater in Europe, where all these nations are within a few hundred miles of each other and can destroy each other perhaps in a few days or even in a few hours. Therefore, as the immediate danger is in Europe the first thing is for the European nations to get together and possibly form a group, even inside the existing League.

696. *Mr. Spender*: Do you not think that the present position in the Far East might be a very important element in determining the policy in Europe?

Lord Davies: Yes, that is perfectly true; at the same time the immediate and pressing danger, as we can see it, is in Europe itself; and once Europe has put its own house in order it will be in a much better position to negotiate, for instance, with the United States of America and to say, "We have done everything that we can to arrange matters between ourselves; now will you not come along, America, and give us your blessing?" The Americans have always been saying that Europe was a hopeless proposition, that the nations of Europe were always squabbling among themselves and that until they were willing to take drastic measures to bring that state of affairs to an end, America did not want to have anything to do with Europe. We also feel, as I have already said, that the danger spot, the great menace of mutual annihilation at the moment is in Europe. We cannot be bombed by Japan, neither can we bomb Japan; it is a question of distance, the radius of bombing attack. Necessity alone, whether we like it or not, compels the nations of Europe in their own interests, in the interests of self-preservation, to enter into some federal bond of this kind and to constitute at least those two essential institutions—an institution which can change the public law and adapt it to meet the new necessities and new changes which have arisen and the pooling of their mutual resources, in order to see that the public law is respected and can be enforced.

697. *Mr. Spender*: You might have one very powerful nation outside, and if you were talking to an American he might take the view that you wanted that international authority in order to keep that one nation outside in order.

Lord Davies: Would it not depend upon whether you had a system whereby any nation which entered the circle was able to demand that this quarrel or dispute, or whatever grievance it had, should be placed before some impartial tribunal for settlement. That is a new instrument which has never been tried before, and once you set up that system, it appears to us that the moral authority which would accrue to it would differentiate it

19 June, 1935.]

LORD DAVIES OF LLANDINAN.

[Continued.]

entirely from, and it could not be compared with, any of the older alliances of the past, because this is a new system which has never been put into operation before.

Mr. Spender: I quite agree it would have to be done by agreement covering the whole ground.

698. *Dame Rachel Crowdy:* I want to ask only one very short question, carrying on with what Sir Kenneth and Mr. Spender have said. *Apropos* the membership of your organisation, have you any members who are non-European?

Lord Davies: Oh, yes, I think we have some. 699. *Dame Rachel Crowdy:* And do they feel, as you do, that the policy might become an European policy, or that the collective states might be European to begin with? Do the Japanese feel that?

Lord Davies: I could not say. We have one or two members from Japan, but obviously the membership is scattered all over the world and it is very difficult to know what the individual members think in any particular country.

700. *Professor Gutteridge:* Have you looked into the question of the British Empire?

Lord Davies: In what way, Sir?

701. *Professor Gutteridge:* Are you going to treat all the different parts of the British Empire as separate nations for your purpose? Supposing the Australians said they would come in, and the Canadians said they would not, would not that create a rather difficult situation?

Lord Davies: No, I do not see why it should. That is what happened in the case of the Treaty of Locarno; we have agreed to certain commitments and so on.

702. *Professor Gutteridge:* I do not think you quite grasp my meaning. What I had in mind was this: Supposing there is a dispute between Australia and Canada and Australia is a member of this body and Canada is not, are you going to employ British members of the police force to coerce the Canadians or *vice versa*? Do you not think a very difficult situation might arise in that event?

Lord Davies: No, I do not think so.

703. *Professor Gutteridge:* I will not press that.

Lord Davies: I will try and answer it if I can. All the members of the British Empire are now members of the League of Nations; when they signed the Treaty of Versailles they were admitted to nationhood and they became equal with us in the organisation of a new body, the League, which was intended to suppress war. Therefore, I take it that although they might not be willing to enter into such a close relationship as the one that I have suggested here, the tribunal and the police force, because they happen to be some thousands of miles away, that should not deter this country, which is the heart of the Empire, from entering into such an arrangement with our neighbours if we think it is in our interests and the interests of the Empire that we should do so. We have already done so in the case of Locarno where the other members of the British Empire—probably quite rightly from their point of view—did not think fit to join us. There is no reason why we should not enter into this arrangement with our neighbours in Europe.

704. *Professor Gutteridge:* I do not think that is quite an analogous case. Take Ireland, suppose Ireland stood out of a scheme of this kind and the United Kingdom was involved in a dispute with Ireland.

Lord Davies: We have been involved in a dispute with Ireland and it has always seemed to me—although I may be quite wrong—that when the resources of the British Empire were exhausted and they could not find any means of settling this unfortunate dispute, as Ireland and ourselves were members of the League, it ought to have been taken to the League.

705. *Professor Gutteridge:* And, if necessary, you would use your international police force to enforce that decree?

Lord Davies: Yes, I would.

706. *Professor Gutteridge:* It is rather more than Locarno, because you have your police force and air force.

Lord Davies: I put in this proviso. I would not suggest to the League, for instance, that members of the British Empire should be the first to have to impose sanctions. For instance, in our own country, in the enforcement of the law, if there is a riot or civil disturbance in one part of the country we do not as a rule send regiments recruited from that particular district to suppress the riot or disturbance in that area. We send regiments recruited from some other part of the country. It seems to me that, very broadly, the same principle would apply to the functioning of the international force.

707. *Professor Gutteridge:* That leads me to the next question I want to ask you. At the present time the policing of the ocean would be very largely a British enterprise, would it not?

Lord Davies: No, I do not think it would.

708. *Professor Gutteridge:* You are going to have your international navy, I assume?

Lord Davies: Yes, I should like to have an international navy, because I believe that is the only way of keeping the navy going. I think that unless there is some kind of international navy, very soon the days of navies will be finished and gone. As instruments of national defence navies and armies have become more or less obsolete. I am reinforced in that opinion by the view expressed by Lord Fisher in 1921, when he said that we were spending £140,000,000 upon an obsolete navy.

709. *Professor Gutteridge:* As I understand your scheme you would have an international navy—a super navy—would you not?

Lord Davies: I should have navies to carry out the policing duties which are now carried out by certain forces I believe in our navy, the customs and all those sort of things which are internal policing measures. Yes, I should certainly have a naval force to carry out those duties.

710. *Professor Gutteridge:* You would want warships to protect your international police force while its members were being transported from one part to another. You would have to have your international navy to do that?

Lord Davies: You would have to have your international navy to police the ocean.

711. *Professor Gutteridge:* And to escort your troops in case of need?

Lord Davies: Yes.

712. *Professor Gutteridge:* Let us now go to something which is more important. You talk of super weapons?

Lord Davies: Yes.

713. *Professor Gutteridge:* Has your Society ever tried to define what those super weapons are?

Lord Davies: Very broadly. It is difficult to specify what should be a super weapon and what should not, but broadly speaking we take 1914 as a very rough division. The weapons that have been evolved have been either invented or developed since that date. There is the pre-war military establishment and the post-war military establishment. Those two things are entirely different, are they not?

714. *Professor Gutteridge:* Yes, except that you are going to get into difficulties if you take that date. That would mean that all the nations would be handling obsolete weapons if you took 1914 as your datum line. It looks as if you would only allow national armies to retain obsolete weapons; is that what you mean?

Lord Davies: The machine gun is an obsolete weapon. I do not think artillery is obsolete.

715. *Professor Gutteridge:* Machine guns have developed more than field guns since 1914.

Lord Davies: What we call super weapons are submarines, poison gas appliances which came into operation during the War, aeroplanes and tanks,

19 June, 1935.]

LORD DAVIES OF LLANDINAN.

[Continued.]

the super-battleships, the new naval developments and the larger calibre types of gun which were evolved during the War.

716. *Professor Gutteridge*: In other words, it is a very broad distinction?

Lord Davies: It is a broad distinction.

717. *Sir Philip Gibbs*: I suppose you would regard the happenings in the Saar at the beginning of this year as an object lesson in the use of an international police force?

Lord Davies: Yes, Sir Philip, up to a point. Of course, we realise that a permanent international police force under the direct control of an international authority is rather different from the police force which operated in the Saar. At the same time we recognise the fact that there was a force which consisted of contingents from a number of neutral nations who had no particular axe to grind in the Saar. It was a demonstration of what might be done if the nations which compose the League were prepared to adopt the same principle in dealing with international relationships on a broad line.

718. *Sir Philip Gibbs*: I imagine that the Saar is rather in your favour as showing that these ideas are not really fantastic, and that there is a great deal to be said for them. Am I right in saying that the French Government under M. Herriot actually made a proposal for pooling all arms with the League of Nations?

Lord Davies: Yes, and M. Tardieu's first proposal involved the creation of an international air police force. That was subsequently further elaborated by M. Herriot at the Disarmament Conference, when the French Government offered to hand over its bombing machines to the League, and he definitely allocated certain other weapons to be used exclusively at the behest of the League.

719. *Sir Philip Gibbs*: Was the proposal accepted by French public opinion?

Lord Davies: I believe it was, because I think they had a secret sitting of the Chamber and the proposals put forward by M. Herriot, which I believe had been endorsed by the military authorities, were adopted by the Chamber. Therefore, it represented public opinion in France.

720. *Sir Philip Gibbs*: Do you think there has been any advance with regard to those ideas internationally—at least in Europe?

Lord Davies: I think so because the governments of this country and France—and probably of

other countries as well, I think even Germany—have announced their willingness to consider and possibly to adopt the Air Defence Pact, which means that for the first time you have there the principle which is fundamental to the whole conception of the League of Nations and which, if Article 16 means anything, means that in future national armaments can only be regarded as a policing agency.

721. *Sir Philip Gibbs*: Of course, all these subjects are rather outside the framework of this Commission, as our Chairman has told you, but I would like to come to one point in the statement that you made—a point that I think would surprise some people—where you say that no time is more favourable than the present for coming to terms with the war-traders. You rather suggest that they have been through an extremely bad time—that in effect they are poverty stricken.

Lord Davies: I ought to explain that I was thinking of the period of ten years or so immediately after the Armistice. That was the period I had in mind.

722. *Sir Philip Gibbs*: You did not make that quite clear.

Lord Davies: I am afraid I did not.

723. *Sir Philip Gibbs*: There is quite a body of opinion which thinks that at the present time the private manufacturers of arms are doing rather well.

Lord Davies: In certain industries. I do not think it would include, would it, the production of battleships and naval requirements? I do not know that they have made any very great profits.

724. *Sir Philip Gibbs*: Perhaps not.

Lord Davies: Or in regard to artillery and so on. But, of course, it is true as regards the air. That is the most sinister part of it.

725. *Sir Philip Gibbs*: There is some evidence that there have been very considerable movements of arms from one country to another lately to the benefit of private manufacturers. Would you agree with that?

Lord Davies: I am afraid I have not that knowledge.

726. *Chairman*: Thank you; we are much obliged to you, Lord Davies.

Lord Davies: May I thank you, Sir, for allowing us the privilege of submitting our evidence to the Commission? We are very grateful.

(The Witness withdrew.)

(Adjourned till to-morrow at 10.30 a.m.)

[The Minutes of Evidence taken on Thursday, 20th June (5th Day), are published separately.]

SIXTH DAY

Friday, 21st June, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.
 Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.
 Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.
 Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.
 Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

The Rt. Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P., re-called and further examined.

907. *Sir Philip Gibbs*: I think you would probably agree that, whatever system had been in force before the War for the supply of arms, the Government would have been taken by surprise by the enormous unexpected expansion of the War?

Dr. Addison: Oh, yes. I think that the expansion was certainly greater than was anticipated by anyone. The point I am seeking to make is this, that our capacity for meeting the expansion under the existing system proved to be inadequate.

908. *Sir Philip Gibbs*: Then would you agree that your successful efforts to stimulate and create supplies had reference more particularly to shells and light forms of munitions rather than to heavy guns?

Dr. Addison: Oh, no. I gave particulars of shells because I thought it was only fair to give the things that emerged when the Ministry was first started. You see the enormous gun programme, for example, was not formulated until after the Ministry was started, and, therefore, I thought it was scarcely fair to mention that.

909. *Sir Philip Gibbs*: You had to rely on the expert manufacturers of guns, did you not?

Dr. Addison: Certainly.

910. *Sir Philip Gibbs*: To increase that supply?

Dr. Addison: But we built the factories and supplied the material on the same system which applied to all other makers of any other commodity.

911. *Sir Philip Gibbs*: I see; but did you find it was possible to increase the supply of guns by non-expert engineering works?

Dr. Addison: The new big gun factories were mainly concentrated adjoining or in association with the existing big gun factories and, of course, Messrs. Vickers' expert was exceedingly useful, just as many other experts. So far as the making of a gun is concerned, or any other thing, my impression was increasingly this, that our engineering resources were so rich that you could very soon train people to make anything.

912. *Sir Philip Gibbs*: That is the point really which I wanted to get from you. You think many people rather under-estimate the engineering capacity of the general trade and are inclined to think it is really more expert than it actually is?

Dr. Addison: Oh, certainly. The evidence was overwhelming on that; we trained people to do all manner of things with a few months' training. We have in this country a wealth of engineering skill which is almost indescribable, I think.

913. *Sir Philip Gibbs*: There are one or two points I wanted to ask you about which were raised in that Committee of Inquiry into Woolwich after the War—the McKinnon Wood Committee. There was one man—it was Colonel Dennis, I think—who was the Director of Gun Factories at Woolwich, and he stated in his evidence that they came immediately up against a steel ring in this country and that it was quite impossible for Woolwich to do anything about lowering prices. Would you agree with that?

Dr. Addison: Certainly; not only steel but other things. It was not until we took command over

those materials and really until we got the Munitions of War (Amendment) Act powers in January, 1916, that we really broke the ring. But steel was not the only example; there was lead and aluminium and ever so many of them. As soon as we got those powers down went the price.

914. *Sir Philip Gibbs*: Thank you. Mr. Roberts, the Chief Mechanical Engineer, gave evidence that Woolwich was always the headquarters of design and that it was necessary for the directors of the national factories to come and pay constant visits to Woolwich to see the designs and to be educated in the technical aspect of their work. Is that true?

Dr. Addison: Certainly, and we greatly enlarged that because all these things, as you will be aware, have to be tested elaborately and, of course, the whole of the testing machinery and all that was focussed there up in the laboratories.

915. *Sir Philip Gibbs*: That rather bears out your argument, perhaps; I mean to say supposing it were possible to nationalise there would be a headquarters of design?

Dr. Addison: Yes, certainly it does, and later when the time is appropriate I shall have something more to say on that subject.

916. *Sir Philip Gibbs*: Then I will not continue with that because, no doubt, Professor Gutteridge will ask you about that later. Then there is the point of secrecy. Of course under the present system of the private manufacture of arms they all form their own designs, and so on, and I imagine also are rather closely in touch with Woolwich; and one of the witnesses at this inquiry said that he considered it was very necessary for the Government to hold its licence of new weapons and improvements secret, and that under the present system that was difficult. Would you agree with that?

Dr. Addison: I would; and I could tell you, I think, if the Commission were to inquire itself that it would be found that owing to the system of manufacture for foreign orders it is possible for things to be supplied to others, which we would prefer to keep to ourselves. I know that has been so.

917. *Sir Philip Gibbs*: I am going to put a rather general question to you. From what you told us the day before yesterday, and from the documents that you have put in, it does seem to me that when the Ministry of Munitions was actually functioning, after some time and experience, it was very successful in creating supplies for the Army.

Dr. Addison: It was indeed; it created them in abundance.

918. *Sir Philip Gibbs*: You of course have leaned heavily towards the view of nationalisation; but judging from your own experience as Minister of Munitions it seemed to me under a system which was partly that of private manufacture and partly that of national manufacture you did succeed in getting a machine to function very well and, therefore,

21 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

would you consider it possible to maintain a rather similar system, part private manufacture and part national manufacture?

Dr. Addison: I want to assure you that I did not approach this question from any political point of view.

919. *Sir Philip Gibbs:* No, I understand that.

Dr. Addison: We simply learnt by bitter experience what was the way to do it. You have to have, I think, your central agency, as I have indicated.

920. *Chairman:* Organisation.

Dr. Addison: Yes, and factory work; because, for the reasons I have indicated, I think the manufacture of your Group A stuff in peace time is more economically done under state manufacture. At the same time you should have all your preparations ready for mobilising every appropriate manufacture amongst our private engineering resources. There is so little magic in either A doing this or B doing that, provided they are competent firms, that there is no necessity whatever to have special people.

921. *Sir Philip Gibbs:* Do you think unity of control necessarily involves state manufacture?

Dr. Addison: I do not see how you are going to do it without. For instance, supposing you take a simple thing like T.N.T. T.N.T. in the quantities which would be wanted for shell filling, and so forth, is not ordinarily made by the chemical industry as an explosive—not in those proportionate quantities; and if you are going to do it for your peace-time and reserve programme, I think there is no doubt that the best way of doing it would be to have a state factory. It applies with less force to one commodity perhaps than it does to another, but as to the more specialised products I do not think there is any doubt what is the more economical way of doing it.

922. *Sir Philip Gibbs:* In your own experience in the Ministry of Munitions you were handling a machine which was in part private manufacture?

Dr. Addison: Certainly; and I think in any case you have to have a machine, as I hope I have made clear, which deliberately sets out to develop the resources of private manufacture. These of course, are essential directly you want to get your big scale production and to enlarge your output. That is quite a different thing from private manufacturers doing it independently on their own.

923. *Sir Philip Gibbs:* Yes; but do you think it would be possible to establish a system by means of which you could get very strong central control over private factories?

Dr. Addison: I really do not think that is practical politics. If a man is carrying on a business for his private profit he is entitled to manage his business himself and it is not fair to saddle him with the responsibility of maintaining a lot of machinery which is not used, and so on. That is the taxpayers' job in a matter of this kind. You have no right to saddle it on to private firms, and, as a matter of fact, it would not work in practice. I am sure it would not.

924. *Sir Philip Gibbs:* I suppose it is rather a formidable thing to establish a state monopoly of arms, and I was going to ask you whether you thought perhaps it would create, at any rate for a time, a rather excessive burden on the taxpayer?

Dr. Addison: I do not think so. Of course it is difficult—everything is difficult; it is a big job; and there are lots of difficulties which would have it is a fantastic idea?

925. *Sir Philip Gibbs:* But you would not consider it is a fantastic idea?

Dr. Addison: Oh, good gracious, no; certainly not.

926. *Sir Philip Gibbs:* Would that include the building of war vessels?

Dr. Addison: We have our own dockyards now.

927. *Sir Philip Gibbs:* Yes, but I am afraid the proportion of government-built vessels is rather small.

Dr. Addison: It would include the building of war vessels. We might have to take over an existing dockyard from a private firm and pay for it.

928. *Sir Philip Gibbs:* You do not think that would create an enormous burden of taxation?

Dr. Addison: I am quite sure the saving in cost and output would more than compensate us for the capital cost which, of course, you would spread over an appropriate term of years in any case. Of course I am postulating successful and competent management.

929. *Sir Philip Gibbs:* I think you did actually read the evidence of Sir Eustace d'Eyncourt?

Dr. Addison: I did.

930. *Sir Philip Gibbs:* I take it you do disagree very strongly with the points that he made that first of all a state monopoly of manufacture would eliminate a great deal of initiative from the private firms in the way of design and improvement.

Dr. Addison: I have taken the liberty of getting out the actual papers on that. Of course Sir Eustace d'Eyncourt was himself, as you are well aware, at the Admiralty, and the tanks committee (or it was called at that time the "land cruiser," I think) was under his chairmanship. Perhaps I may be allowed here to hand to the Commission this paper just to look at and not to be reproduced. (*Document handed to the Commission.*) You will see that is an excellent case of the system which I think is preferable namely, a central department dealing with design, invention and so forth, but which uses and mobilises ideas from outside and places facilities at their disposal for being tested out. With that I will put in here, if I may, a typical monthly report which was made to me from the Inventions Department, and you will see the variety of things which they were handling. At that particular time there were 2,286 suggestions that had actually been developed and made use of. I think these papers will give you an example, or, shall I say, an impression, of the kind of system which I believe is best adapted to open out private initiative and give it a chance, and still to combine with that the central direction.

931. *Sir Philip Gibbs:* You have no objection to our seeing those papers?

Dr. Addison: No; I brought them on purpose, but I think it would be better if they were not printed.

932. *Sir Philip Gibbs:* The costings system is a very important branch of your work and, of course, from the evidence you have put in, it did result in enormous economies. Do you think, from your own knowledge, that your experience is being made use of now?

Dr. Addison: Not so much as it ought to be, I am afraid. We have slipped back a good deal; but I have no doubt it has been made use of, and I think it did lead to the private firms generally making a much better use of good cost-accounting methods—at least many of them—than they had done before. In that respect I think the influence is permanent and very valuable. So far as the state departments are concerned, I have my misgivings.

933. *Sir Philip Gibbs:* There is one point which perhaps is not very important but, still, it is a rather interesting point. You published an article on 3rd March of this year in which you said you might find that there are agreements between British and foreign firms by which a British firm gets a commission on every shell fired by the foreigner concerned; and you said that after the last war Krupp sued a well-known British firm for royalties on every one of the 123,000,000 fuses sent over in hand grenades by British soldiers. Could you tell me whether that royalty was paid?

Dr. Addison: That is a question of which I should require notice. I had the facts before me at the time when I wrote that article.

934. *Sir Philip Gibbs:* You could not say off-hand?

Dr. Addison: No, I would prefer not to say, but I know the statement is correct enough; and, of course, if you remember, in the Inquiry in America there was considerable evidence, I think, particularly in the case of submarines, where a British firm, or an American firm I think in this case, was receiving a share of the profits out of orders obtained for others, and I see that in paragraph 5 of this report,* which I quote in my statement of evidence, the accountants reported to me, in the second paragraph, "There is reason to believe, although the point has not yet been raised, that in the case of Vickers, at least, the cost of the world-wide selling organisation upon which they have laid so much stress, has been amply met by the commission earned on orders placed in America for the British Government." That is the same kind of thing. I have no doubt I am not complaining; it is the system that if a firm has a patent or some rights in a thing, whoever makes it, they are entitled to what they are entitled to under it. I do not think you can complain of it; it attaches to the system.

935. *Sir Philip Gibbs:* You have said some rather interesting things about the subject of aeroplanes and the differences of design, and so on. First of all, I should like to get the point that the Government during the War had to rely almost entirely on the private manufacture of aeroplanes, had it not?

Dr. Addison: I have here the actual paper, the report which was made to me by Lord Weir and the late Sir Percy Martin, whom I appointed to be head of this section of supplies when it was handed over to the Ministry of Munitions. You see, the thing was new, and most of the machines were made at that time in factories run by private firms. What happened was that we equipped factories for specialised products, a type of machine or a type of plane, or whatever it was, and they were made controlled establishments like the rest and managed by the personnel on the spot of the different firms concerned; in some cases they were our own. You could not have a better case of the need for centralised direction than there was in the case of aeroplanes. It was complete confusion before. During the latter half of 1916 there was the Air Board, the War Office and the Admiralty placing contracts in all sorts of ways with a great variety of firms. We often found one shop, for example, making three or four or even more different types, we will say, of parts of engines or whole engines, and so forth, and the result was that they were not getting any supplies. There was a great duplication of types. Here I can give you actual figures. I abstract them in the statement of evidence, paragraph 53. The result of centralised control and direction of the system that I am speaking of was, first, that we pooled orders; instead of one shop making half a dozen things it made one thing. We had to scrap the whole system of orders and produce a great simplification in the number of designs, and so forth. Whilst the work was actually being done, it was being done, most of it, at that time in private firms' shops, and very well done, too; but owing to the unco-ordinated system you were not getting the product, until we had supplied them with the machine tools, materials, and everything, and could begin to get output.

936. *Sir Philip Gibbs:* Under a different system do you think it would have been possible to obtain the constant development and progress in type which was made during the War by the private firms?

Dr. Addison: With great respect, it was not made by the private firms. The system which was adopted to encourage improvement in type was the establishment under Lord Cowdrey (I think it was), who was the first President of the Air Board as it

was then set up, and on that central body there were representatives of the more alert private firms and representatives of the different departments, the services, and so on, and in that way they were able to pick the brains and make use of the private people as well as the initiative of the men in the Air Force itself.

937. *Sir Philip Gibbs:* I did not know that.

Dr. Addison: You have to make the best use you can of all sources of ingenuity instead of leaving them scattered.

938. *Sir Philip Gibbs:* So it really was not the direct initiative of the private manufacturers?

Dr. Addison: In some cases it was, and in some cases it was not. The point I am on is that you cannot make use of it, but not for a moment would I in any way disparage their immense service—not a bit—but they had not a chance before.

939. *Sir Philip Gibbs:* Of course, you had to look at two things: the quantity of supplies as well as the type?

Dr. Addison: Yes. Of course, it was continually developing, as it is now, no doubt. There are all kinds of ingenious men who are always making for improvements, sometimes in private firms, sometimes in the services.

940. *Sir Philip Gibbs:* You had some very interesting things to say the day before yesterday about labour. Of course, some points are historical, the fact that skilled labour was recruited for the trenches and had to be called back again. I suppose that was due to the fact that the authorities did not know how long the war was going to last, or the enormous expansion of our army, and so on?

Dr. Addison: Yes; and the patriotism of the men themselves—they all rushed to the colours.

941. *Sir Philip Gibbs:* But, of course, there were very grave troubles during the War with regard to labour, were there not?

Dr. Addison: Terrible—two years of it.

942. *Sir Philip Gibbs:* Do you think that under a national system of manufacture those troubles in the future might be less or greater?

Dr. Addison: When you are dealing with millions of people you are bound to have trouble whatever is the system, but it was quite clear before we came into existence that the attempts to divert labour, we will say, from a non-munition manufacturing firm to a munition making firm were giving rise to endless disputes. It was because of that series of disputes that what is known as the Treasury Agreement was arrived at, under which we agreed that certain standards should apply to payments for piece work, and so on; that when a man moved from one district to another where the wage rates were different, certain other principles should apply. In working it out we had an infinity of trouble—of course we had—and I am afraid you will have, human beings being what they are, wherever it happens.

943. *Sir Philip Gibbs:* You do not think it would be rather an additional danger, if all the manufacture of arms were under the state, that labour might find it easier to attack or resist state authority, being entirely under one authority?

Dr. Addison: I am not afraid of that. You see, we had trouble everywhere, but we had more trouble on the Clyde than anywhere else, and they were private firms, and then we had a lot of trouble at Woolwich as well. I am afraid that under circumstances of that kind there are always plenty of opportunities of difficulties cropping up; but, especially the Clyde, which was almost entirely large private firms, was a continual source of trouble. I am not blaming the private firms—of course not. It was a very very difficult time. New questions were cropping up every day; you had to deal with them as best you could, but you certainly could not deal with them unless you had some body of persons of experience who were gradually gathering experience, like our labour department was, and getting

* Appendix, p. 120, Exhibit C.

21 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

to know how to deal with them. Otherwise we should have had an everlasting series of outbreaks and trouble. We had plenty as it was.

944. *Sir Philip Gibbs*: I think you rather wanted me to ask you a question about sub-contracting, and it would be very interesting if you could develop the difficulties that you had and which were found to exist.

Dr. Addison: In paragraph 69 of my statement of evidence, I epitomise some of the main reasons why the system of sub-contracting cannot be relied upon to give you the expansion which you want. In the first place, you have the human difficulty, which I can assure you cannot be exaggerated, of the objections of men moving from one firm to another; so that, so far as reinforcement is concerned, that is outside the power of the major contractor. He cannot supply his sub-contractor with additional labour, he cannot supply him with material in an orderly manner. They do that for themselves; or, at least, they wish to obtain their own materials. He cannot supply them with additional machinery if they want any, because at that time they were all scrambling for machines, or whatever it was; so that the limitation of the sub-contracting possibility in that respect is due to the capacity of manufacturing departments of the sub-contractor. Well, that means that he has to be helped in the job; he has to have specifications, drawings, gauges, and an orderly supply of parts, particularly of key parts, and all those things are not the business of the major contractor, and the sub-contractor resents him coming into his place to interfere with the way he does his job, and that is bound to apply when you rely upon that system.

945. *Sir Philip Gibbs*: You did in fact have to abolish that system, did you not?

Dr. Addison: We did. It was found to be associated with so many sources of difficulty and trouble that we abolished it, and we developed a system whereby we diverted the orders ourselves. The appropriate statistical departments, of course, were in touch with the requirements as to machinery, materials, and what-not, that were supplied, and the sub-contracting previously intensified the scramble for materials just as it did for machinery, and that was another reason why we simply had to abolish it and make a central method of supply. It did in fact break down as the best way of opening up the manufacturing possibilities of the other firms—it was not the best way of doing it. Then, of course, with sub-contracting you always have—and I do not see any way of escaping from it—the difficulty about prices. Naturally the major contractor, quite fairly, expects to make something out of it, in which case the sub-contractor has to take less than the terms of the major contract, and that leads to all manner of questions. That was one of the reasons why, instead of sub-contracting, we were inundated with demands that firms should make for the state itself, and it was that agitation, shall I say, which led to the formation of the local committees which it was found had been called together in a scrappy form in some places before the Ministry was created. Then there is always this about prices, that they always brings up questions of wage rates, which vary in different districts; and hanging around the issue of prices as between the major and the minor contractor there is a whole mass of squabbles which arise. That was another of the reasons why we felt that dealing directly through the munition committees was a cleaner method.

946. *Sir Philip Gibbs*: I imagine that in the case of another war, if this system of private manufacture were continued, the system which you actually adopted as Minister of Munitions would have to be enforced at once, would it not, based on past experience?

Dr. Addison: Certainly.

947. *Sir Philip Gibbs*: You would have to have control; you would have to have this costings system,

and you would have to have absolute unity of direction?

Dr. Addison: Certainly, straight away.

948. *Sir Philip Gibbs*: I think that one of the strongest arguments with which this Commission will be faced from people who violently disagree with you is that in a period of peace, if it were to be a considerable period of peace, the state manufacture of arms would tend first of all to become very static and standardised, and, secondly, it would be impossible during that long period of peace to maintain either the skilled labour or the reserves of stock which would be necessary at the outbreak of war? Would you agree at all with that argument?

Dr. Addison: No; it has no relation to reality at all. You had three points; would you just remind me of them?

949. *Sir Philip Gibbs*: First, the static condition?

Dr. Addison: From the national point of view it surely is better that you should be delivered from a system whereby a number of people are touting about the world in order to get orders for this, that, or the other warlike novelty. There is no particular advantage in that that I can see.

950. *Chairman*: May I interrupt you for one moment, because that is an important point you have mentioned: that the fact of our nationalising the trade would not really diminish the amount of touting that goes on in the world. It would simply be done by other nationals unless the system became international?

Dr. Addison: Of course, we cannot control what other people's nationals do. It would subtract from the sum of touting when it was contributed by our nationals.

951. *Chairman*: It might increase the number.

Dr. Addison: That might be so, but we have some very ingenious and competent nationals. At all events, it does seem to me that no advantage arises and many disadvantages inevitably attach to that system.

952. *Chairman*: If it tended to reduce touting there might be something to be said for it, but my present impression is rather this: that if they went out of business there would be more people trying to get into it, and more touting?

Dr. Addison: In other countries?

953. *Chairman*: Yes.

Dr. Addison: So far as that is concerned, I am afraid, with respect, that that would mean that you could not do anything in this matter until the time arrived when you got all nations to combine.

954. *Chairman*: I agree we must try and do what we can, but it is no good advancing an argument in favour of doing something which is not a sound argument.

Dr. Addison: Of course, I think myself that it would in fact diminish touting, shall I say . . .

955. *Chairman*: It is a general word.

Dr. Addison: commercial travelling, if you like —if the whole sum of our factories was withdrawn from the business; because we have, I believe, about one-third now of the export of munitions of one sort or another, so far as there are any made in peacetime in this country, and it would be a material subtraction, and I should not be afraid of the other touts. In any case, coming to the point that Sir Philip Gibbs put to me, I think that the stereotyping of business which he has in mind is not more likely to occur under this system than under the other. It depends entirely upon the management and the men who are in charge. Now let me give you a case where exactly the opposite happened. There was the Vickers trench mortar; that was a sort of stock thing if you like which was pressed on other countries. It was in fact the initiative of the departments and of men from the front, like Newton and others, taken up by the departments, which led to the development of the more modern and serviceable mortars, and Sir Wilfrid Stokes in particular came to us and we placed our services at his disposal.

956. *Professor Gutteridge*: Where was he before?

21 June, 1935.] The Right Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P. [Continued.]

Dr. Addison: I think he was somewhere in the eastern counties.

957. *Professor Gutteridge:* He was an engineer, was he not?

Dr. Addison: He was an agricultural machinery maker.

958. *Professor Gutteridge:* In other words, new blood came in from outside?

Dr. Addison: Yes, that is right. He was not a munition maker; I think he made agricultural machinery somewhere in the eastern counties. Anyhow, he came along with his suggestion; we helped him to develop it, and after its usual teething troubles it became adopted; but we had a great struggle to get it introduced as against the stock pattern, which was a patent of a private firm, and which was practically discarded because it did not stand the test.

959. *Professor Gutteridge:* I should have thought that was an argument against you, if I may say so.

Dr. Addison: Not for my system.

960. *Professor Gutteridge:* I should have thought it was. Your system had to be broken down before this new thing could come along.

Dr. Addison: I was answering the question as to whether the stereotyping—

961. *Professor Gutteridge:* I will not interrupt you.

Dr. Addison: In that case it was the central department that broke down prejudice.

962. *Sir Philip Gibbs:* There were two other points which I made in the same question. One was with regard to the belief that there would be a deterioration in skilled labour under a national system and after a period of peace.

Dr. Addison: All I can say is that they were continually coming to ask us to spare men from Woolwich. We had some of the finest men in the world.

963. *Sir Philip Gibbs:* I think the argument goes a little further than that. If private manufacture creates constant skilled labour for a particular purpose, and if that were abolished, would not you find that gradually the skilled labour began to deteriorate and disappear?

Dr. Addison: It is not arms manufacture that maintains and produces skilled labour; it is the thousand and one things which people are making all the time; and the reserve of skill that we tapped from firms that had never made munitions at all was so immense that the other was a drop in the ocean. We tapped some of the best skilled men in the country from the watchmakers in Hatton Garden, and what applies to watchmakers applies to lots of the other trades.

964. *Sir Thomas Allen:* Are we then to take it as a general conclusion from your evidence, and from your replies to questions so far, that you are convinced that state monopoly of the manufacture of armaments is a sound business proposition?

Dr. Addison: Yes.

965. *Sir Thomas Allen:* Viewed from the point of efficiency and economy in time of peace or in time of war?

Dr. Addison: Yes. In time of war it would require to expand and make use of private capacity as I have explained; I am satisfied that is the proper way of doing it as a business proposition.

966. *Sir Thomas Allen:* No difficulties at present present themselves to your mind in respect of raw materials or supplies of manufacture?

Dr. Addison: No, you get your raw material equally well; in fact if anything perhaps you would get it more easily if you ordered it in bulk; I think you would. That presents no difficulty.

967. *Sir Thomas Allen:* Would you proceed to give it consideration from the national point of view apart from any international consideration.

Dr. Addison: Yes, I should certainly. I think we have to do what is the right thing.

968. *Sir Thomas Allen:* And in that particular you would go even further than the American plan now being considered in Geneva?

Dr. Addison: Yes. I have studied that plan with great care and quite frankly I do not think it will be found to work. I think you must either do one thing or the other. I do not think that sort of hybrid would combine industrially with the world now in peace time.

969. *Sir Thomas Allen:* Do you think that the traditional obstacle of the services or the political obstacles that would be put up would be a more difficult proposition to overcome than those of actual manufacture?

Dr. Addison: I think myself of course there are lots of difficulties whichever way you deal with it; but I think if you put up a fair proposal, which I should seek to do, manufacturers would be perfectly prepared to give it fair consideration. In fact I could mention the name of the firm that I know which has a very large quantity of most costly plant idle, they do not like it, and I think if you made them a fair proposal as to how the matter was to be dealt with they would be rather glad of it. I think you have to do the thing fairly and if you did that you would be treated fairly.

970. *Sir Philip Gibbs:* Do you think there would be great opposition on the part of the services themselves?

Dr. Addison: I think there would be a good deal of opposition on the part of some sections of the services but by no means on others. It depends on the section of the services we are talking about.

971. *Sir Thomas Allen:* When Colonel Carnegie came before us he advocated a scheme of a national board which would be free from what he called political or military control. Personally I cannot conceive any organisation being set up which would be absolutely free from some political control.

Dr. Addison: You cannot have it.

972. *Sir Thomas Allen:* But what I should like to ask you is in what relationships would the three different service departments stand to your central supply and manufacturing departments; would they be in the nature of consultants, collaborators, or would they have representation on your central authority?

Dr. Addison: The arrangement substantially would be that the service departments would say what they wanted. They would formulate the programmes and discuss amongst themselves first, then with the supply departments, the quantities that might be forthcoming in say X months, or whatever it was. The service departments, those that were using the munitions in other words, would be required to be represented on your design department much on the fashion of the Air Board scheme that has been provided; but apart from that the supply department would be charged with the duty of producing the goods from start to finish and it must have all the matters relating to production under its control. The service departments would say what they wanted; it would be their business to use them. With regard to the first part of your question, we did have in Canada, under Sir Joseph Flavelle, I think it was, a Munitions Board set up there, and I expect it was that type of organisation which Colonel Carnegie had in his mind.

973. *Sir Thomas Allen:* I think he was in charge of it.

Dr. Addison: He was at a later period and it worked, I think, on the whole pretty well; but it was an improvised arrangement at the time. At all events it worked more successfully than the system which had been previously adopted.

974. *Sir Thomas Allen:* Reverting to the evidence of Sir Eustace d'Eyncourt referred to on Wednesday and again by Sir Philip this morning, he did not imply that government servants are not fully equal to men outside, but rather that their ardour was damped by certain conditions of service, a failure really to reward inventive genius.

Dr. Addison: Well, he was a government servant himself.

21 June, 1935.]

The Rt. Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P.

[Continued.]

975. *Sir Thomas Allen*: He pointed out, for example, that a patent taken out by a servant of the Admiralty must be assigned to the government department for which he worked. You told us in reply to a question put to you by the Chairman on Wednesday that you would favour compensation for displaced private armament manufacturers. You are out for efficiency just as we are; would you favour or encourage inventive enterprise within your central department by a modification of the system now prevailing in each government service?

Dr. Addison: Yes.

976. *Sir Thomas Allen*: In other words, would you reward inventive genius apart from salary or even promotion considerations.

Dr. Addison: I would be willing without any prejudices to adopt the system which I found worked most successfully. If a monetary reward was appreciated then I should have no hesitation at all in providing it, provided I got the results which were worthy of being obtained. To go to your first point, *Sir Eustace d'Eyncourt* was, as I have said, at the Admiralty. I think the Inventions Department (the records of which you will see) provides an excellent example of a good system of evoking and rewarding inventions—good ideas—either outside or inside the service. You have, of course, and we always shall have, the service prejudices and traditions, and we shall never get away from them, human nature being what it is.

There must be a different system from what you have now, because now you have it scattered amongst different services partly relying on firms, and the services are used more particularly for inspection and that sort of thing. It must be under the supply department—a special body of men whose job it would be to do this and to develop design and encourage whatever it is. That must be their job; and my experience is that if you give a body of public servants a job to do they are competent fellows and in the main they will take a pride in doing their job just as much as anyone else. For my part I have found them extraordinarily competent, whatever job you give them to do. I may say this, too, that if you look through that document you will see that there are thousands of poor fellows who get their ideas blocked under the existing system; they are not on good terms with their foreman very likely.

977. *Sir Thomas Allen*: That is what I want to avoid.

Dr. Addison: That happens wholesale.

978. *Sir Thomas Allen*: Can you give us any assurance that they would not be blocked under your scheme?

Dr. Addison: I think the fact that we had 30,000 of them to deal with is a proof that they got a better chance. I do not say they might not be blocked to some extent under either system—they will—but I am quite sure they are blocked now. Everyone of us who knows this first hand must have in his mind lots of cases where good fellows' ideas have been smothered.

979. *Sir Thomas Allen*: The witnesses who came before us on behalf of the League of Nations' Union expressed considerable divergence of opinion on the relative merits of state control and state monopoly of manufacture of arms, and that divergence I gather extends very largely to the members of the Union apart from the witnesses who appeared before us. Could you help us in this particular? Have you any views why either of these is more or less desirable than the other, state control as distinct from state monopoly?

Dr. Addison: I think you must have both within limits. I am only going on the result from one's experience as to what we found was the best way of working. I think that certain things the state itself must be responsible for and, particularly say in the chemical trade, you will find it more desirable and advantageous to have a system of control—in the marginal supplies, so to say. We have to work it in the most successful and practical way. I think for marginal supplies the control

system would have to apply. For others—what I call Class A, and gas and chemical warfare—the state itself would be responsible.

980. *Sir Thomas Allen*: Lord Davies told us on Wednesday that the time was opportune and favourable to come to terms with the armament manufacturers more specially with regard to air equipment. Do you think, as we are entering a new era with regard to the production of aircraft, that the state could begin to implement your proposals by an immediate start in aircraft production?

Dr. Addison: Yes, I do.

981. *Sir Thomas Allen*: Or failing that, assuming control over aircraft production as a first step?

Dr. Addison: The trouble is I think certainly with this great expansion of aircraft manufacture—

982. *Sir Thomas Allen*: My point is that there is a new enterprise as it were.

Dr. Addison: That is right.

983. *Sir Thomas Allen*: If your system is of any advantage at all you could prove it, say, with regard to a new enterprise such as this.

Dr. Addison: I think you could; and I believe that aircraft and munition manufacturers as business men would look at the proposal fairly just like other people would if you had a fair proposal to make. There are always a good many difficulties when you get into questions of specialised material that you want for supply, and so forth. It might be practicable—I would not express an opinion without a close examination of it or a closer examination—to isolate aircraft engines and aeroplanes as a state thing and not extend your state control or management to the others; but I should have serious misgivings as to whether that was the successful way of doing it.

984. *Sir Thomas Allen*: There is as you know one existing classical example of a country where armaments, in common with other forms of production, are in the government's unfettered hands and no difficulties arise as to the righteousness there of one form of state control or the iniquity of another. In view of your proposals do you see at all a case for warning or encouragement in such an example?

Dr. Addison: You are speaking of Russia. One hesitates to draw conclusions unless one has a very close knowledge of the facts, which I do not profess to have of that particular country. I am quite sure with regard to our own country, which I do know, that it would be a practical proposition, and that is as far as I would care to go. I have deliberately excluded other considerations—not that I wish to minimise their enormous importance—but I have tried to deal with it purely on its merits as a manufacturing proposition. I am sure it could be done in this country. What conclusions I am to draw from the Russian example I would not venture to say, because I do not know the details sufficiently well.

985. *Sir Thomas Allen*: You made out a very strong case against the continuation of private enterprise in armaments manufacture; but considering the body of your evidence you leave us a little uncomfortable as to the peace-time activity or inactivity of our own government departments. You yourself told us, for example, that there was considerable dependence by the military authorities on the expert advice of the armament manufacturers. You pointed out, as *Sir Philip Gibbs* indicated, an entire lack of any costing system within the departments, and you were not sure, in your own words, that any effective remedy is being made in that direction which is now common, as you know, in any modern business enterprise.

Dr. Addison: Yes, but the reason for that is that we have reverted to the other system.

986. *Sir Thomas Allen*: Yes.

Dr. Addison: If the state had to do it it would have to have it.

987. *Sir Thomas Allen*: I want the danger avoided of any possibility of reversion under any new system, and what I was going to ask you was this; apart from war-time experience has any government at

21 June, 1935.]

The Rt. Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P.

[Continued.]

any time taken their arsenals and their armament workshops seriously as a state service or a state necessity; have they considered that from a practical point of view?

Dr. Addison: I cannot say that they have, but you must remember that the whole business has entirely changed since the last war—the whole outlook, and so on; the dimensions of it and all that have completely altered, but I cannot tell you what other states have adopted this method in peace time.

988. *Chairman:* I think the question was directed only to our Government and not to foreign governments.

Dr. Addison: I see. I am quite sure if once the system were established and became the working system no government would want to upset it any more than they upset the Forestry Commission or the Central Electricity Board, or anything else. When these things get established and get into working order successive governments carry them on. I do not think that question would arise. So far as the departments' activities were concerned I think whilst there might at first be a bigger volume of work in accumulating adequate reserves, and so on, and later slowing down when you had accumulated the reserves, it would in fact come to the maintenance of a certain level of manufacture with your machinery ready for expansion if it were required. That is what it would come to and it would be a much more economical way than scattering it about in twenty different places.

989. *Sir Thomas Allen:* Would you say under the pressure of armament firms that orders to keep them going and render them efficient in any case of emergency that the efficiency of our present government factories has been reduced below the limit of safety?

Dr. Addison: I think they have been reduced, but whether they have been reduced below the limit of safety or not I could not say; but I am quite sure the pressure for orders from private firms must have tended in that direction. Whether it has reduced them below the limit of safety I would not like to say; I do not know.

990. *Sir Thomas Allen:* You will agree that only highly industrialised states can profitably manufacture appreciable quantities of armaments.

Dr. Addison: Yes, that is so.

991. *Sir Thomas Allen:* Given your central authority of supply and manufacture by the state what would be the position under your scheme of those non-producing countries which now depend upon our private manufacturers for supply?

Dr. Addison: The extent of this business, which I have informed myself about since our last meeting, is really much less than a good many imagine.

992. *Sir Thomas Allen:* It is one-third of the total output.

Dr. Addison: I know the total value of the output of the whole affair in gold dollar statistics: I have turned them into sterling, subject to the decimal points. The total value of export of arms from Great Britain during 1931, 1932 and 1933, which are the last years I have worked out, was £2,952,000, £2,893,000 and £3,306,000. Well, it is a bagatelle. It is nothing compared with the manufacturing capacities, and, if I may say so, it is quite unreasonable to suggest that the maintenance of that is going—I am not saying you suggest it, but I know there is a suggestion—to secure the maintenance of the efficiency of these great firms. It is not. It is a bagatelle.

I think what you would have to do, Sir Thomas, in reply to your question, is this: It would necessitate an international arrangement as to the supplies to be obtained or provided for states which did not manufacture for themselves; it would require an international convention.

993. *Sir Thomas Allen:* But in the meantime they must be protected in some way or another. In the meantime would you sell from your state department?

Dr. Addison: So far as it was agreed to supply them by this international convention. That is the only way in which they could be supplied.

994. *Sir Thomas Allen:* Would you have a sales manager under your scheme?

Dr. Addison: I should be sorry to see a national commercial traveller touting for orders for arms.

995. *Sir Thomas Allen:* Just a moment. Given a national commercial traveller, would he be expected to be any less eager to obtain orders?

Dr. Addison: I would not appoint him on those terms.

996. *Chairman:* You would not employ him to do nothing.

Dr. Addison: No, I would not. It would not be one person at all, it would be some body. Rifles would go to the rifle department, and something else would go to another department. The expression "a commercial traveller" is a figure of speech. There would be anyhow a jolly sight fewer of them than there are now running about the world.

997. *Sir Thomas Allen:* In what position, say, would your Indian Empire or the Dominions or Colonies be under your scheme?

Dr. Addison: They would negotiate with the state departments in the ordinary way. They would be supplied.

998. *Sir Thomas Allen:* You see no danger of them setting up any departments at all?

Dr. Addison: They are very independent people.

999. *Sir Thomas Allen:* I know they are.

Dr. Addison: And they will do what they wish, whatever we think here. I think that position would apply either way.

1000. *Sir Thomas Allen:* Suggestions have been made to us that we should enjoy the benefits of both systems, state manufacture and private manufacture. Can you suggest any way—because that is the important point we have to consider—of removing the objection to the profit-making in the arms industry, or what is called taking the profit out of war, and still leave the private manufacturer to make any of the weapons of warfare?

Dr. Addison: Quite frankly as a business proposition I do not see how you could work it. You see that is one of those amiable arguments which is held out by people who have never had the job to do. It is not fair to ask a private firm to use their machines, *et cetera*, *et cetera*, without profit. They are working for profit; that is what their job in life is. Supposing there is an order to use one shop on this restricted profit basis, or whatever it is, and there is another order in another shop of a more profitable kind—what will happen? Only one thing will happen; the thing which has the more profit in it will have precedence of the thing which has the less profit in it; and quite right, too; you cannot blame them for it; and it would not in fact work. I think you could have a system of controlled establishments or controlled orders for your marginal supplies in the way I have tried to indicate, but to think you could ask private manufacturers who were carrying on a *bona fide* business to do some of their work without profit, and some with profit, would not in fact work in practice.

1001. *Sir Thomas Allen:* Can you visualise nationalisation solving any moral difficulty?

Dr. Addison: I think the moral difficulties and the international difficulties are very vastly less under the suggestion I have mentioned, but you will still have difficulties—I am afraid that is the frame of mind of people—but the difficulties will be less.

1002. *Professor Cutleridge:* Perhaps you would help by answering a few questions; first of all with regard to certain difficulties which have occurred to me; and then I will ask you something about those supplemental matters which were held over from last time. Your proposal, I think, is in the nature of an experiment, is it not?

Dr. Addison: No.

1003. *Professor Cutleridge:* It has never been tried before, has it?

21 June, 1935.]

The Rt. Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P.

[Continued.]

Dr. Addison: We did it; that is my point.

1004. *Professor Gutteridge:* With great respect to you, it has never been tried before, has it?

Dr. Addison: We worked it; that is why I am suggesting it.

1005. *Professor Gutteridge:* I suggest to you it has never been tried, and that state monopoly of the armaments manufacture has never yet been put to the test in an emergency which would arise on a sudden outbreak of war and on a large scale such as occurred in 1914. Could you give me any instances where that has happened?

Dr. Addison: The point I am suggesting to you is that there was not a state monopoly on the outbreak of war, and it was not until we did establish a state monopoly that we obtained adequate supplies.

1006. *Professor Gutteridge:* That is not the point I am on. There are no instances in history, so far as I am aware, of a country which had nationalised the arms industry and then suddenly had to face such a catastrophe as occurred in 1914?

Dr. Addison: No, that is true.

1007. *Professor Gutteridge:* And therefore—

Dr. Addison: We have to learn our lesson.

1008. *Professor Gutteridge:* Therefore I say it is an experiment.

Dr. Addison: With great respect, it is not an experiment. I am saying we tried the experiment the other way round in 1914 and it failed—

1009. *Professor Gutteridge:* It does not follow that your experiment will succeed, necessarily, does it?

Dr. Addison:—and it did not succeed until we did it the other way. That is not a fancy; that is a fact.

1010. *Professor Gutteridge:* That is what I want to press; because all your experience, you know, is war experience, is it not?

Dr. Addison: Yes.

1011. *Professor Gutteridge:* Your experience does not relate to what happens when war breaks out on a huge scale, as it did in 1914?

Dr. Addison: But is it not the test that matters?

1012. *Professor Gutteridge:* Yes. That is what I am suggesting to you: that it has never yet been tested.

Dr. Addison: But I suggest to you, with great respect, that is what we did. We did test it—

1013. *Professor Gutteridge:* Then we must agree to differ; that is all.

Dr. Addison: We tested it in a most dramatic fashion.

1014. *Professor Gutteridge:* In some respects I think the armaments people were not unsuccessful, were they, from 1914 to 1919? Let us take shipbuilders.

Dr. Addison: Certainly. The point was that they failed to keep their promises, but under the system which was developed we enabled them to make good.

1015. *Professor Gutteridge:* You are speaking of shells, are you not?

Dr. Addison: No; it applies to all.

1016. *Professor Gutteridge:* What about warships?

Dr. Addison: The same applies. As you know, with regard to the building of big warships, which was undertaken substantially under a similar system, we supplied all the steel.

1017. *Professor Gutteridge:* Were there complaints of huge shortages of deliveries in the case of warships?

Dr. Addison: There were huge complaints of shortage of supplies for merchant ships. As to warships, no, I think not. They were made in all sorts of places.

1018. *Professor Gutteridge:* The reason I asked you that was this: As a matter of fact, a good deal of skilled labour was in fact absorbed by the shipbuilding yards, was it not?

Dr. Addison: Well, we mopped up all the skilled labour there was, and I would not have said that the proportion employed in the shipbuilding

yards was higher than it came to be in other branches of production. They were all very greedy people. One of my difficult jobs was to hold the balance between the competitors.

1019. *Professor Gutteridge:* You are still following this matter, I suppose, and keeping in touch with developments in the matter, are you not?

Dr. Addison: I try to keep myself reasonably well informed. I would not put it any higher than that.

1020. *Professor Gutteridge:* Have you heard it said that if we were faced with an emergency now there would be very considerable difficulty in getting skilled workmen on certain types of armaments manufacture?

Dr. Addison: Oh, no.

1021. *Professor Gutteridge:* You do not agree?

Dr. Addison: No; certainly not.

1022. *Professor Gutteridge:* You have not heard proposals made, for instance, for the importation of unemployed watchmakers from Switzerland in order to supply the deficiency?

Dr. Addison: A man who makes a proposal of that kind has not any idea of the row that would arise as soon as he tried to operate it. There are tens of thousands of skilled people in this country; I can assure you the skill of the British people is almost beyond description.

1023. *Professor Gutteridge:* I am very glad to hear you say that; but, as a matter of fact, I do suggest to you that there are certain branches of armament making where, owing partly to the fact that there have been so few new entrants into these branches of trade, owing to depression, and so on, there is a definite shortage.

Dr. Addison: Would you mention one? It is not my business, perhaps, to ask questions, and perhaps that is an impertinence.

1024. *Professor Gutteridge:* I have been told, for instance, that there is already a shortage in certain branches connected with the manufacture of aeroplane engines.

Dr. Addison: I will undertake to say that, whatever the engine was, if you had a rational system for mobilising and training your skilled men you could obtain them in abundance. I am quite sure of that.

1025. *Professor Gutteridge:* I am only putting these things to you because we shall no doubt have them before us.

Dr. Addison: I should not attach any importance to that sort of thing. I am sure it is wrong.

1026. *Professor Gutteridge:* You are certain of that?

Dr. Addison: Absolutely.

1027. *Professor Gutteridge:* May I now pass on to deal with those supplemental matters which you asked us to give you an opportunity of saying something about. The first is Exhibit "M"; it is headed: "Transfer of responsibility for design." When you were giving evidence you asked if you might be allowed to say something more about that.

Dr. Addison: Yes. The point there was, you see, that when we started, the design department was in a compartment under the War Office—the M.G.O.—and then testing was at Woolwich. At first inspection was not under our control. We found ourselves confronted with the necessity, quite properly, of delivering goods that would pass test. The result was that inspection and test were inseparably associated with the supply of proper goods, so that they had to be taken over. As it developed, all manner of modifications of design were called for, partly because we wanted new things and partly because we wanted to save money. It will be within your recollection that at one stage of the war there were a lot of what we called "dad" shells. That was because the particular fuses at that time adopted were not satisfactory. It was no good going on manufacturing those fuses if they did not work when they were produced; so that design was brought over, too, not from any mere greed to have hold of it, but because it was necessary to have that associated with manufacture. In the same way the

21 June, 1935.]

The Rt. Hon. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P.

[Continued.]

demand, for example, for copper, was very urgent—in copper bands, an enormous tonnage of copper was used—and it was imperative that, if possible, some of it should be saved. That was another reason; so that design, inspection and testing, and so on, are, I suggest, inseparably associated with supply, and it is a mistake to have them in separate departments. Just as a private firm has that all under their own head when they are making the things, so must a state department. I asked to be allowed to supplement thus what I had said because I thought that the text of Exhibit "M" did not, perhaps, sufficiently indicate the sort of sequence of events which led to that being brought about.

1028. *Professor Gutteridge*: When you were dealing with paragraph 73 in your opening speech you indicated, I think, that you wished to say something as to what was meant by an adequate reserve?

Dr. Addison: The amount of reserves that you would require would depend upon the difficulties in replacing or increasing your supplies. Take, for example, a rifle; you may take it that a new factory for producing rifles to augment your supplies takes 18 months from the time you decide to put it up to the time you get the first rifle. That is putting it roughly. That is to say, with a thing that takes a long time in augmenting supplies you would therefore have to have a bigger reserve. If you have a thing which you can produce quite rapidly, say, in three months, then you would not need to have so big a reserve. That was what I meant.

1029. *Professor Gutteridge*: There is no mathematical calculation which you can apply?

Dr. Addison: No. It must depend upon the commodity as to the months of reserve you ought to have; and the really critical element in the calculation is as to how quickly you can replace it.

1030. *Professor Gutteridge*: Then there was the question of sub-contracting; but Sir Philip asked you about that, so I do not think we need go into it again. Then there is another note I have here which relates to reserves of certain specialised types of machinery. I suppose you are referring there to machinery and machine tools, are you not?

Dr. Addison: Yes, I am. As you are aware, some are of a very highly technical character, and you would have to have a reserve of machines.

1031. *Professor Gutteridge*: That would apply also to gauges and jigs?

Dr. Addison: Yes.

1032. *Professor Gutteridge*: And specifications, drawings, and so on?

Dr. Addison: You would have to have them in any case.

Professor Gutteridge: Yes.

1033. *Sir Philip Gibbs*: I rather wanted to ask you one question relating to a case you gave in which you said that, in your opinion, there would be opposition by the services to national manufacture.

Dr. Addison: Certain sections of the services.

1034. *Sir Philip Gibbs*: Why do you think there would be opposition?

Dr. Addison: Only tradition. I am sorry to say it, but I think that tradition is very strong in the services. It is not to manufacturing as a manufacturing proposition, because they have no knowledge or experience of it. It is just tradition, and it is very strong, and we had (I am speaking with great respect to these gentlemen) to overcome their traditions. Their traditions are strong like other people's are, and there is a certain section—say the specialised artilleryman—who is always accustomed to deal from one year to another or from one month to another with representatives of certain firms, and so forth. He gets habituated to that sort of thing, and tradition is very strong indeed in—shall we say—the specialised branches of the services; not so much in the others. I think you would have difficulty with it, but I always myself found, whether he is a soldier or a civil servant, if the state says he is to work a certain system he will do it, *con amore*. The difficulty would not last long.

1035. *Chairman*: One general question; I do not know whether you can answer it "Yes" or "No," but the question is this: If the control organisation of the Ministry of Munitions in its completed form had been in operation in the early part of 1914, would not nearly all the difficulties enumerated in your statement have been either entirely avoided or greatly reduced?

Dr. Addison: Certainly they would have been greatly reduced, and it would have saved tens of thousands of lives.

1036. *Chairman*: Yes; but I mean supposing the organisations were set up to-day.

Dr. Addison: With the factories?

1037. *Chairman*: Yes. The organisation set up to-day all ready to be put into operation immediately the emergency arose, a great many of the difficulties which you experienced in 1914, 1915 and 1916 would never arise?

Dr. Addison: Yes, that is true; if you included in the term "organisation" the body of men with experience who are actually doing things, that is so, certainly.

1038. *Chairman*: Unless there is anything you wanted to add, or which anyone else wants to ask you, I think I may say on our behalf that we thank you very much.

Dr. Addison: Thank you.

(Adjourned till Wednesday, July 17th.)

APPENDIX

STATEMENT OF EVIDENCE SUBMITTED BY THE RIGHT HON. CHRISTOPHER ADDISON, P.C., M.D., F.R.C.S., M.P.

1. My evidence is derived from my experience at the Ministry of Munitions, of which I became the Under-Secretary upon the constitution of the Ministry. I was informally appointed on the 26th May, 1915, the Ministry being constituted by an Act of Parliament that received the Royal Assent on the 9th June, 1915. I remained the Parliamentary Under-Secretary under Mr. Lloyd George until July, 1916, and under Mr. Montagu until December, 1916, when I became the Minister of Munitions, an office which I held until July, 1917. I then became the Minister of Reconstruction.

2. In order to explain the position as I found it, when the Ministry of Munitions was constituted, I must first refer briefly to some earlier developments.

Soon after the outbreak of war it was clear that the existing system of munitions production was inadequate. It had either to be supplemented or expanded. As early as October, 1914, it was suggested that it should be supplemented by co-operative production on the lines successfully adopted in France. At that time, however, the opinion of the military authorities and of "their expert advisers, the armament firms" * was adverse to such a course. They preferred to expand the existing system by the employment of new sub-contractors from the general engineering industry, to whom the armament firms could pass on such work as, while their own new factories were building, they could not themselves absorb. The armament firms were to draw additional skilled labour from other engineering firms, not engaged on direct contracts for War Office work.

3. Early in 1915 the difficulties of such expansion were becoming apparent. Firms were reluctant to transfer labour to the armament makers, believing that they squeezed their sub-contractors and had already, by the high wages which their large profits enabled them to offer, deprived the outside engineering industry of many of its skilled men. In consequence there was a demand for direct contracts for such work as the outside industry could undertake, in place of sub-contracts from the armament firms. That demand was supported by the Board of Trade.

4. After many negotiations and inquiries a co-operative group was started in Leicester in March, 1915, and it was suggested that co-operative production—various firms undertaking various processes—might be applied in areas outside a 20-mile

radius from existing government factories or recognised armament works. Within that radius skilled labour was to be transferred to the existing armament makers. By the end of April the distinction between areas within and without such a radius had broken down. Instead there were set up local munitions committees, which were to concentrate the resources of the area in national shell factories to be staffed and equipped by the local firms and operated by management committees. Co-operation by groups of independent employers remained as a supplementary alternative.

Deliveries from national shell factories and co-operative groups did not begin until the end of August, 1915, and accordingly, before I came to them, I will describe the position as I found it, when the Ministry of Munitions was first constituted.

5. My first duty as Under-Secretary was to participate in an investigation of the position as regards the demand for munitions, the orders given and the deliveries made. I propose to summarise the results of these inquiries as regards guns, shells, machine guns and rifles.

6. As regards guns and shells, the problems facing the Ministry are indicated by the following quotation from a report on its work, compiled in November, 1915:—

"At its formation, the Ministry was faced with four main tasks—

(1) It was urgently necessary to hasten and expedite delivery on existing contracts for guns and ammunition.

(2) The orders already placed had to be supplemented, not merely by additional orders of guns and shells, but, what was also of great importance, by further orders for various components, such as fuses, primers, gaines, etc.

(3) The existing capacity for the filling or loading of shell and components was inadequate to deal with the orders already placed—far less to handle the further output—and measures had to be taken on a far more comprehensive scale than had up to that time been contemplated.

(4) The Ministry had to undertake an enormous new programme of heavy guns and of the corresponding ammunition."

The position as regards deliveries due on existing contracts for guns and ammunition (principal types) was as follows on the 1st June, 1915:—

* History Min. Mun. Vol. I, Part III, p. 2.

Type.	Gun.		H.E. shell (thousands).		Shrapnell shell (thousands).	
	Promised.	Delivered.	Promised.	Delivered.	Promised.	Delivered.
18 pdr. ...	744	604	818·6†	18·4†	3,223·5†	1,192·2†
60 pdr. ...	68	19	114·6	35·1	95	42·4
4·5" how. ...	426	122	330·8	54	178·2	45
6" how. ...	—	—	131·9	8·8	8·3	—
8" how. ...	24	24	9·9	·1	—	—
9·2" how. ...	16	16	34	8·9	—	—
12" how. ...	15	1	7·5	—	—	—

† Including both shells and complete rounds.

The total deliveries of shells by contractors amounted to 1,526,400 against promises, due for delivery by the same date, of 5,723,900. The average arrears were 65·8 per cent. of promises in the case of shrapnel and no less than 91·5 per cent. in the case of high explosive. To the above figures may be added promises of 292,100 shells of various types from government ordnance factories, which had been more than fulfilled by deliveries of 308,000.

7. The above figures include a few orders placed abroad, of which the largest was with the Canadian Government. Those orders were placed by the War Office in order to meet the failure of British contractors to deliver. The position of the chief British contractors at the end of May, 1915, as regards promises, deliveries and arrears of all types of shells, is shown in Exhibit A.

8. Of machine-guns, 2,482 has been promised for delivery by the 1st June, 1915, 1,115 of which had been delivered. The proportion of arrears in the case of rifles was lower, some 308,000 having been delivered—nearly 50,000 short of the promised quantity. The difficulty, however, was that, with the manufacturing capacity as it was, even on the orders given not more than a million might be expected by March, 1916, and, with reasonable allowances for arrears and defects, the provision for the new armies would be hopelessly insufficient.

9. The position summarised above was obviously critical and dangerous. Existing arrangements had proved quite inadequate to meet the demands of the first ten months of the war. There was a most alarming deficiency of high explosive shells, and the troops in France had to be rationed to scanty and most inadequate allowances. Moreover, with the increasing intensity of trench warfare and the arrival of the new armies in the field, the need for shells and other munitions was bound to increase very greatly.

10. Before examining the reasons for these deficiencies and the steps that were taken to overcome them, I should revert to the local organisations, mentioned in paragraph 4 above, and to what was learnt as to the costs involved in the system then being adopted. Under the general direction of the late Lord Stevenson the whole country was divided into engineering areas, and local boards of management constituted, including what had previously been arranged for.

The machinery and manufacturing capacity of all the firms in the different areas was investigated, and as rapidly as possible they were associated with the supply of such parts as they were appropriate for. In October/November, 1915, there were 30 national shell factories in operation and 26 co-operative groups. Every effort was made to simplify specifications and drawings for inexperienced manufacturers, and to simplify patterns in order to eliminate unnecessary processes, but much delay was occasioned by a shortage of precise drawings, specifications, gauges, etc. Nevertheless, although deliveries had only begun at the end of August, the output of 18 pdr. H.E. shell from these sources in October exceeded the total deliveries from all sources (home and foreign) during the month of June.

11. The above-mentioned organisations were mainly directed to the supply of shells, but there was also required a concurrent supply of components, such as fuses and primers and the spread of the manufacture of such parts had to be arranged for. Above all, adequate arrangements for filling and assembling the completed shells were urgently required. The War Office had already begun to erect new factories outside Woolwich for the latter purpose. In addition to these, 15 other factories and five munition stores were started and provided by the autumn of 1915, and the whole task of allocating components was organised, so as to prevent congestion or delay. At the same time the Ministry took over the Ordnance Factories at Woolwich, Enfield and Waltham. In connection with these extensions, a scientific system of central control of stores served to promote the flow of shell and components for

completed ammunition, while inspection was de-centralised and the staff of inspectors was increased so as to avoid unnecessary transportation of shells, components and explosives.

12. The need for heavy ammunition was particularly urgent. To meet it, the Ministry, with the assistance of an expert in factory construction, set up national projectile factories, which were arranged to be worked under the direction of existing firms. By November, 1915, 11 of these were already approaching the stage of production. I shall have occasion to refer again to their work.

13. By the end of 1915 the above developments were beginning to have effect. The prospect of great increases in the volume of supplies and the establishment of new factories called for proper control of expenditure, and in August, 1915, a branch of the Ministry was instituted to deal with cost accounting. In October, 1915, I appointed Mr. Lever, the distinguished accountant, to take charge of this branch. He became the head of the Financial Department of the Ministry, and was made responsible to me for examining and sanctioning all important contracts. As a result of his investigations and of the information made available by the construction and operation of national factories, large contracts were placed during December with local organisations at prices considerably lower than those charged by the armament firms.

The experience obtained between August and October showed that the costs of manufacture, including generous allowance for amortization would enable us to obtain supplies from the national factories at much lower prices than had hitherto been paid, and that great economies were obtainable through the organised supply of materials and through the establishment of a proper costings system. Accordingly negotiations were begun with the armament firms.* I suggest that the need for such negotiations, their course and their results, throw considerable light on the questions with which the present Commission are concerned.

14. The subject of the first negotiations concerned the price of shells. The position in January, 1916, is conveniently summarised in the report (appended hereto as Exhibit C) by a committee of Mr. Lever and his colleagues, meeting on the 24th of that month.

As a result of this report, on the 31st January, I took the chair at a meeting of representatives of the Ministry, of the five armament firms mentioned in para. 2 of Exhibit C, and of Messrs. Cammell Laird. At that meeting I stated the prices which the Ministry were prepared to pay for deliveries up to the end of June—which prices were based upon a careful ascertainment of costs at our factories with an adequate allowance for profits and for sinking fund. The minutes of the meeting and the prices so offered are appended hereto as Exhibit D. The meeting was adjourned until 3rd February, when the firms submitted counter-offers, which were accepted in the case of all shells except those for 18 pdr. guns and 4·5 inch howitzers. In those cases, with two or three particular exceptions reserved for further discussion, it was agreed that manufacture should proceed provisionally on the basis of the prices proposed by the Ministry, but that if it could be shown by a friendly comparison of costs, that the cost of manufacture, allowing for a fair profit, was greater than that allowed for in the Ministry's prices, the Ministry should, if necessary, pay the increased price up to, but not exceeding, the amount of the reduced offer by the firms. None of the armament firms in fact availed themselves of this proviso

* There had already been difficulties with them as regards contracts, and although it would be out of place to discuss such difficulties in detail, I append hereto (Exhibit B) a letter from one of them, dated the 30th November, 1915, as an instance of the type of difficulties which had arisen. It will be noticed that the firm in question asserted a right to supply 18 pdr. H.E. shell on existing contracts, which were at the price of 20s. "for a period of not less than the duration of the war."

and the prices proposed by the Ministry were accepted.

15. The course and effect of the above negotiations is summarised in the following Table:—

	Original prices		Prices proposed by Ministry.	New prices offered by Armament Firms.	General average reduction per shell.	Programme of weekly production of shells.	Weekly saving by reduction.
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.		£
<i>H.E.</i>							
12" ...	22 10 0	to 25 0 0	20 5 0	21 2 0	2 13 0	1,600	4,240
9-2" ...	13 2 6	to 14 15 0	10 10 0	11 7 6	2 11 3	11,400	29,212
8" ...	9 3 4	to 10 0 0	7 15 0	7 17 6	1 14 2	17,000	29,041
6" ...	4 0 0	to 4 10 0	3 7 6	3 10 0	15 0	57,000	42,750
60 pdr. ...	3 0 0	to 4 2 4	2 9 6	2 12 6	18 8	34,000	31,733
4-5" ...	2 7 0	to 3 5 0	1 13 6	1 19 6	1 2 6*	110,000	123,750
18 pdr. ...	1 0 0	to 1 3 0	12 6	14 8	9 0*	260,000	117,000
<i>Shrapnel.</i>							
60 pdr. ...	3 0 0	to 3 15 0	2 15 0	2 17 6	10 0	46,000	23,000
18 pdr. ...	17 6 to	1 0 0	18 9	18 9			
							£400,720†

* In these cases the prices proposed by the Ministry were accepted.

† This estimated saving is based on the general average reduction. A much greater saving was actually realised with the subsequent increase in output.

Costs of material and labour had risen substantially since the prices then being paid had been fixed. The reduction in the firms' own offers was, therefore, all the more striking, and it should also be noted that although substantial increases in wage rates occurred, later in the War, it was not found necessary to increase the prices paid for shells.

16. Similar negotiations took place as regards the price of cordite. The Finance Department of the Ministry suggested that cordite contractors should be asked to disclose their costs of production of cordite before prices were fixed for supplies in 1916, as it was strongly suspected that the existing prices were excessive. Accordingly, on the 1st February, 1916, they were asked to render returns as to their costs of production and as to the capital employed. Excuses were made and no returns were in fact received. Nobel's Explosives, one of the principal contracting firms, then asked whether the matter could be settled by a reduction in price. Their basis price at the time was 2s. 3d. per lb., and in reply to an offer of a lower price they submitted a statement showing a total cost of about 1s. 11½d. and a profit of 3½d. per lb. The Ministry, however, could not agree to their figures and an appointment was made for accountants to examine their books. They then asked to re-open negotiations, and after a number of meetings they accepted a basis price of 1s. 8d. per lb., the Ministry undertaking the risk of explosion, for which insurance had recently been offered and refused by Nobels at a premium equivalent to ½d. per lb. Aircraft and bombardment risks were also accepted, but were insurable at rates which, including the risk of explosion, amounted to less than ½d. per lb. The reductions in prices effected by these negotiations amounted on an average to 7½d. per lb. or, on the total production estimated for the latter part of 1916, including the contracts both of the Ministry and of the Admiralty, a total saving of nearly £4 million annually. The detailed figures are shown in a statement appended hereto as Exhibit E.

17. I give the above instances as conspicuous cases, in which the investigation of costs and the information made available by the operation of national factories enabled the Ministry to effect very large reductions in the prices paid to contractors and showed that those prices had originally been grossly excessive. The investigation of costs met with considerable resistance from contractors, and I append, as Exhibit F, a circular sent out to all members of district associations of controlled firms as late as the 15th August, 1916. But the reduction in prices continued, and, although I do not want to take up the time of this Commission with any detailed examination of later periods in the War, I append a short table showing some contract prices about a year

later, compared with those fixed early in 1916, to which I have referred in paragraph 15 above. The prices in March, 1917, provided for a recent rise in wages of 5s. per week, and notwithstanding that provision represented a saving of some £500,000 a year, as compared with those of February, 1916.

Armament firms' contract prices for principal natures of H.E. shell.

	Early contracts.	Feb. 1916.	March 1917.
18 pdr.	20s. to 23s.	12s. 6d.	12s. 6d.
4-5"	47s. to 65s.	33s. 6d.	27s. 10d.
60 pdr.	60s. to 82s. 4d.	52s. 6d.	42s.
6"	80s. to 90s.	70s.	61s. 6d.
8"	£9 3s. 4d. to £10 0s. 0d.	£7 17s. 6d.	£6 12s. 6d.
9-2"	£13 2s. 6d. to £14 15s. 0d.	£11 7s. 6d.	£9 7s. 6d.

18. The same processes as had been applied to the costs of shell cases yielded similar results when applied to other ingredients, and even to the minor details of filling processes where the contracts related to a price per hundred or per thousand as the case may be. For example, the saving in a large number of filling contracts for different parts to the first half dozen contractors on the output that was arranged for the first six months of 1917, showed that the price agreed upon as the result of investigation as compared with the prices originally arranged represented a saving with these six contractors alone of nearly £370,000 per annum.

19. By way of a similar comparison with the position about a year later as regards the national factories, mentioned in paragraphs 10 and 11 above, let me quote a statement supplied by the Finance Department of the Ministry in April, 1917.

"The capital expenditure on national factories for gun ammunition components amounts, at the present time, to £23,000,000. As a result of this expenditure, goods have been produced at a cost of £39,000,000 which, if they had been bought at contract prices, obtained after the application of the costing system, would have cost £42,000,000. A saving of approximately £9,000,000 had, therefore, already been effected by this means, and, if economy is secured in future on the same scale, the whole capital cost of the national factories will have been repaid in about eighteen months from the present date.

"It should be added that many of these factories have been in operation for a short time only, and, in the case of those which have been the longest in operation, namely, the factories for the manufacture of T.N.T., while the capital

R

cost has been less than £1,500,000 goods have been produced at a cost of £3,500,000, which, at contract prices, would have involved an expenditure of £6,000,000. In the case of these factories, therefore, a saving very much in excess of the total cost of the factories has already been secured."

20. The factories included in the foregoing statement were 27 high explosive factories, 11 propellant explosive factories, 16 national projectile factories mainly for the larger shells, and 32 of the so-called national shell factories largely administered by the boards of management.

The time required, at the cost of production then being obtained, as compared with the contract prices obtainable before the full repayment of the capital expenses of all the factories would have been obtained, was 20 months from March, 1917, and it is certainly within the mark to say that the total capital cost of all these factories as represented in the diminished cost of production, notwithstanding the progressive rises in wages, had been repaid by the end of the War.

21. Before I leave the question of output from national factories, I should like to illustrate the part they played in the production of ammunition in later years of the War by the statistics appended as Exhibit G.

22. The last-mentioned statistics illustrate the rapid and enormous increase in the output of one very important class of munitions. I do not wish, however, to over-emphasise the distinction between trade production and production from national factories or through the groups organised under munition committees. The Munitions of War Act, 1915 (2nd July, 1915), empowered the Minister of Munitions to declare any establishment in which munitions work was carried on to be a "Controlled Establishment" and all, or virtually all, the firms responsible for the trade production shown in Exhibit G were so controlled. The control extended not merely to profit, wages and conditions of labour—the principal matters affected—but also to the "general ordering of the work in the establishment with a view to attaining and maintaining a proper standard of efficiency." In practice, however, the Minister did not take over the management or direction of the establishment, unless there were special reasons for doing so. I should add that the powers under the 1915 Act were enlarged by the Munitions of War (Amendment) Act, 1916 (27th January, 1916), and that, in particular, they were extended to require controlled establishments to give information as to their costs of production and the cost and source of the materials used.

At the same time, on the advice of those in charge of the Materials Supply Department of the Ministry, the extended powers were used to cover the total supply and distribution of an increasing number of metals and other materials in order to frustrate a disposition which we found to exist in some cases to hold back supplies for a rise in prices, as well as to secure an even distribution in order to meet the necessities of the case in accordance with a priority in the urgency of the demand.

23. Let me now turn to an examination of the difficulties that necessitated the concentration of production under the control of the Ministry. I submit that they indicate the need for national control on a similar scale in any emergency and that the extent to which their solution either involved national ownership or would have been facilitated by it has an important bearing on the questions before this Commission.

24. From the first days the Ministry was confronted by the failure of the specialist makers to obtain a sufficient augmentation of the skilled labour necessary for expansion of production by transference from other firms as had been hoped for from the arrangements devised before the formation of the Ministry and referred to in paragraph 4. In addition, many invaluable skilled workmen had been enlisted and sent abroad before the Ministry was constituted, and the process was continuing. A Labour

Supply Department of the Ministry was, therefore, rapidly constituted and efforts were made to secure the return from the army of "key" men who had already been enlisted (Release from the Colours). Apart from these efforts, which were only partly successful, it had to undertake three main functions: first, to prevent the enlistment so far as possible of essential skilled men; second, to secure as good a use as possible of the existing skilled labour; and, third, to augment the supply by training. Under the second of those heads fell, not only the transference of labour from one works to another so far as was practicable, but also the adaptation of forms of skilled labour, not previously employed on munitions, to munition making. The third head included the training of women for many tasks, for which skilled men had previously been considered indispensable.

25. I will deal with the above points in order, but summarily. The details will be of little interest to this Commission, but the general lesson I draw from these difficulties is that they were so grave as to tax the resources of the Ministry to the utmost, and that no private firm or combination of private firms could possibly have dealt with them.

26. As regards releases from the colours, the Ministry, acting in conjunction with the War Office, between July, 1915 and April, 1916, investigated over 40,000 individual applications for release and allowed some 15,700 of them. Further, in July and August, 1915, nearly 7,000 soldiers, whose trade qualification seemed to warrant investigation, were interviewed by skilled investigators: rather over 2,000 were released. In the autumn of the same year a four weeks' investigation by 25 representatives of the Minister (including 16 Members of Parliament) and 132 skilled investigators resulted in addressing over 1½ million soldiers, of whom rather over 100,000 volunteered for munitions work and were interviewed: about 40,000 were selected. In the spring of 1916 a deputation went to France and worked over the entire British Front. Some 17,000 soldiers representing the high types of skill required were interviewed and about 1,700 of them were finally selected. All those investigations involved nearly a quarter of a million interviews, at the rate of 750 a day. The comparatively small number of about 45,000 finally selected indicates both the care and skill applied in investigation and the impossibility of confiding such a task, involving, as it did, continuous co-operation with the War Office, to private industrialists, whether in competition or in combination. The 45,000 finally selected were drawn from over 4,000 different units of the Army, and distributed among nearly 4,000 employers.

27. The limitation of recruiting falls into three periods—those of voluntary enlistment, of the Derby attestation scheme and of compulsory service. During the first period war service badges were issued in certain scheduled trades and to the employees of certain scheduled contractors. From January to July, 1915, the issue was made by the War Office and the Admiralty and from July, 1915, by the Ministry of Munitions. The war service badge was a temporary device and there were many anomalies in its issue: but it served the immediate purpose of checking the enlistment of munition workers, whose labour was essential for the production of armaments. Under the Derby attestation scheme the issue of badges was not suspended, but was supplemented by the "starring" of more than 1½ million men of military age—almost 30 per cent. of the men of military age, who had attested. Of the starred men, rather more than half were munition workers, while the remainder consisted of miners, agricultural workers and railwaymen. In November, 1915, the enlistment of badged and starred munition workers was prohibited, and a few of those who had been wrongfully enlisted were released at the instance of their employers. Under the Military Services Acts of 1916, badged and starred men were to be exempted, and from this time onwards to the termination of the War the position became increasingly difficult. It is not, however, necessary for the

present purpose to describe the various expedients that were adopted and the anxieties and troubles that were inseparable therefrom. They were issues which in any case could only have been dealt with under state authority.

28. The proper utilisation of the available skilled labour involved questions of transfer from one firm to another. It was necessary whenever possible to ration out skilled workmen among all the firms engaged directly or as sub-contractors in the production of munitions. With the extension of munitions work to firms whose business had previously been unconnected with it, and the increasing scope of the work recognised to be of vital importance in the War, the demand for skilled labour became more insistent and more widespread. The gaps left in those works from which transfers were made, or existing in others, where only a skeleton of skilled labour could be supplied had to be filled by mechanisation and by "dilution". The machines had to be as simple as possible, intended for the particular work in hand. They were designed for mass production. They were to be operated by the unskilled labour, which, untrained or partly untrained, was collected from all sources to dilute the insufficient supply of skilled men.

29. An attempt was made to allocate the supply of skilled labour by the institution of a scheme of War Munitions Volunteers. It was begun in the late summer of 1915 and subsequently in response to an ambitious programme of publicity some 120,000 men had enrolled themselves as ready to be transferred for munitions work to any controlled establishment. It was found, however, that the larger part of these volunteers were already engaged on war work or on work such as the railways and mines, from which it was inexpedient in the national interest to remove them. Moreover, the protests from employers, when the men enrolled or were ordered to transfer, were numerous and forcible; nor were the proposed new employers always willing to accept volunteers—to whom they might have to pay higher wages, if they came from a highly rated district, and a subsistence allowance—for, although that additional payment was recoverable from the State, they feared discontent and trouble among other workmen. In the result only some 13,500 volunteers had been transferred by August, 1916, and at that time further enrolments and transfers were both proceeding at the rate of 300 or 400 a week. The difficulties experienced in carrying through such a scheme even on the authority of the State and under a great patriotic impulse are sufficient to explain not only the early failure, but the impossibility of its being done by private firms.

30. The difficulties and disputes arising out of the dilution of labour during the War were so notorious that I confine myself to pointing out that the questions of principle, sentiment and interest involved could not conceivably have been faced, let alone settled, by any authority other than the Government of the country. If those questions had been left for settlement by private employers, with or without support from the Government, the resulting friction and disturbances would not merely have hindered the output of munitions, but would have made it quite impossible to carry on the War at all.

31. As regards increasing the supply of skilled labour of a critical or "key" type, I can best illustrate my point by one or two instances (which may be taken as typical):—

(a) Gauges are essential for the manufacture as well as for the subsequent inspection of the various parts of shells, fuses, guns and all other munitions. Workmen accustomed to precision work—for the order of accuracy required might well amount to a thousandth or a ten-thousandth of an inch—could be adapted and trained as gauge-makers, but the supply of men already accustomed to gauge-making was dangerously small, and quite insufficient for what was required by the increasing output of

munitions. As a result of the examination of the possibilities of various undertakings such as the Perforated Music Co., Waterlow & Sons (printers), the L.C.C. Tramways, R. Hoe & Co. (printing machinery), various telegraph and telephone companies, J. W. Benson Ltd. (watch-makers), and even the Metropolitan Water Board were given orders for gauges for shell fuses and the like, and by August, 1916, 130 jewellers—to take one trade alone—had already been trained and placed as gauge-makers.

(b) By the same date nearly 200 plumbers had been trained as lead-burners for the explosive factories and 500 other men as tool-setters on one special type of machine.

(c) Before the War 90 per cent. of the optical glass used in the country was imported from the continent, some 60 per cent. coming from Germany. The making of lenses and prisms was supposed to be highly skilled work, requiring two or three years' training. Under the optical munitions department of the Ministry, special machines were introduced and women were trained at the Optical Munitions School in working them. By the beginning of 1918 one-third of the 1,720 optical glass-workers in the country were women, and by the end of the War the proportion had increased to 50 per cent.

32. The Commission will appreciate that just as the supply, allocation and use of labour are essential to the production of munitions, so is the supply of materials and machinery.

33. The issues that arose with regard to the supply and control of materials may be indicated under three heads. In the first place come such obvious bulk materials as steel and other metals, the ingredients of explosives and other chemicals. In the second place come materials essential, but required in smaller quantities and often from limited sources, either of importation or manufacture. In the third place come those materials, which in production are so associated with the materials actually required for munitions that the control of the latter, in order to secure an adequate supply, involves the control of the former, sometimes for the complementary purpose of restriction.

34. The position with regard to materials supply may be illustrated by taking the examples of steel, aluminium and sulphuric acids with other illustrations of materials, the requirements of which had far-reaching indirect results.

Steel as a bulky material wanted in enormous quantities, making great demands upon shipping and of which the supply and distribution could only be dealt with by a central organisation.

Aluminium as a metal difficult to obtain in adequate quantities, and which was required for a great variety of manufactures presenting variations in regard to urgency.

Sulphuric Acid as a commodity required for a great variety of purposes, and in which the character of the War demand involved not only a great increase in supply but a difference in the form of manufacture of a substantial proportion of it as compared with peace-time requirements.

35. In the case of Steel at an early stage the Ministry had to assume complete control not only of all supplies available for home manufacture but of such contributions as we could make to the needs of our Allies. This involved control of pig iron, as material for the steel-makers. We controlled the output at home through controlled establishments and the imports from abroad. The annual output of pig iron remained throughout the War at about 9 million tons, and the imports at between 6 and 7 million tons. The output of all types of steel ingots and castings rose gradually from rather over 7½ million tons in 1914 to some 9 million tons in 1916 and over 9½ million tons in 1917 and 1918. Of this amount shell steel accounted for about 1½ million tons. There were limits to the home production of the latter and imports rose from between 280 and 290 thousand tons in 1916 to nearly 1½ million tons in

1917 and rather less in proportion during the first three-quarters of 1918. It is sufficient to point out that the problems of labour and transport at home and overseas, presented by the above quantities would have been completely beyond the competence of any other authority than the Government.

36. *Aluminium* was needed for a variety of purposes—in fuses, high explosives (ammonal), hand grenades, motor transport, aviation, water bottles and incendiary bombs (thermit). Of the world output of 78,700 tons in 1913 about 10,000 tons came from the United Kingdom. The estimated requirements for munitions purposes in July, 1915, were nearly 20,000 tons a year, of which over 16,000 were required for explosives. They were met partly by increasing the annual United Kingdom output to about 11,000 tons, partly by taking 7,500 tons from Canada, partly by purchases from other producers in the U.S.A. or elsewhere. By November, 1916, the Allies required nearly 60 per cent. of the world output, including enemy countries which sold their supplies to Germany. Prices of ingot had risen from £81 per ton in January, 1915, to about £300 per ton. These conditions led to a complete system of purchase of all supplies, and as the aluminium demand for aeroplanes and airships increased, an increasingly strict rationing system became necessary.

37. *Sulphuric Acid* was required in great quantities in a concentrated form (oleum) for the manufacture of explosives. The bulk of the acid in peacetime is required in a dilute form for a great variety of purposes, including for instance the production of super-phosphates, various other chemicals, bleaching powder, dyes, tar, etc. By May, 1916, the annual production of weak sulphuric acid had risen from 1,680 thousand tons pre-war to 1,870 thousand tons. For explosive purposes, however, the weak acid is concentrated and the average yearly production of some 60,000 tons of concentrated acid (oleum) before the war had been increased nearly sevenfold. Construction work on an unprecedented scale provided an increase of nearly 400,000 tons of oleum a year. The alternative to that construction work would have been some form of general requisition, involving the destruction of numerous trades and even then the supplies would have been utterly insufficient. As it was the Ministry was able to leave a substantial surplus of the output of acid for essential trade purposes and to provide, in other cases, a substitute in the form of nitre cake, a waste product from the manufacture of nitric acid, another important ingredient in explosives. The substituted use of nitre cake involved experiments on an industrial scale, publicity for their results and the collection, storage, transport and distribution of the nitre cake. All those tasks were undertaken and performed by the Ministry. In addition economies in the use of sulphuric acid were effected by manufacturing another essential, ammonium nitrate, from ammonia liquor instead of from ammonium sulphate. This is an instance in which the full resources of the Ministry were successfully used both to ensure a sufficient supply of essential material and to prevent such a wholesale dislocation of other essential trades as would have resulted from a shortage.

38. I should like to refer to the effect of the above-mentioned steps on cost. Before the War oleum cost 85s. a ton. As early as May, 1916, it was produced in national works at about 55s. a ton, and some 2,050 tons were so produced weekly from sulphur alone. At that time some orders had been placed in the U.S.A. at an average price of £12 a ton, while the ordinary market price exceeded £80 a ton. As compared with the lower U.S.A. price, the saving on 2,050 tons a week, represented by national production instead of by U.S.A. purchases, amounted to £976,050 a year. The national works in question represented a capital outlay of £750,000.

39. As instances of materials, the control of which involved the control of other substances associated with them in production but not themselves required for munitions, I may refer shortly to glycerine and alcohol, both essential in the production of explosives.

Glycerine is separated out of palm kernels, cotton-seed, soya beans, coconuts, etc., in the manufacture of soap, margarine or cotton-cake. It is a by-product of those trades, and in order to secure a sufficient supply the Ministry was obliged to make arrangements with the manufacturers concerned or to control the trade. As regards soap, for instance, the Ministry, soon after its formation, bought all the output of glycerine for the duration of the war at £45 per ton. The market price was then about £40 per ton, but it rose rapidly in the open market—in the U.S.A. for instance—to far higher figures. The first result was an increase in the retail price of soap, margarine, etc., in the United Kingdom, in order that the manufacturers, having to pay more for their palm kernels, etc., might make out of their other products the profits they were unable to take out of glycerine. Later on attempts were made by the larger concerns to undercut their smaller competitors in regard to soap prices, with a view apparently to bringing them into the combine. The smaller competitors, also producers of glycerine, complained loudly, and finally the Ministry was obliged to fix the prices for soap.

40. Another instance was *alcohol*. In order to secure supplies of that product, the Ministry were compelled to take over and control the whole distillery trade. There were some curious results. Maize, for instance, is the raw material both for alcohol and for yeast. It is a bulky cargo, and the Ministry, in order to make full use of shipping space, limited imports of maize to secure the necessary supply of alcohol and no more. The result was a shortage of yeast. The Ministry tried to secure economies in the use of yeast, which brought down on my head the indignant protest of housewives in the North and in Scotland, who habitually bake their own bread and consume, in doing so, a greater proportion of yeast than does a commercial bakery. In consequence the Ministry had to control yeast, and to ensure a sufficient supply to the complaining housewives and others. It provides an interesting illustration of the extent to which the control of munitions may have to go.

41. Finally, as regards the control of materials, I append hereto, as Exhibit H, a summary report on the position of materials for explosives, made in July, 1915, as illustrating the early necessity for central control in order to secure both a necessary plan of production as well as a distribution of supplies in accordance with need.

42. I now turn from labour and materials to the third side of production—the machinery used for the conversion of materials to munitions. I will take first, as an instance, the question of machine tools.

43. *Machine tools* are power-driven machines for cutting, working or abrading metal. They include lathes and machines for milling, planing, grinding, etc. They are indispensable for the production on any large scale, not only of shells, but also of guns, rifles and other munitions.

At the outbreak of War the manufacturing industry in Great Britain worked principally to produce in small quantities such particular and different machines as were required by its customers. Under the pressure of American competition there was a growing tendency to some measure of specialisation. With home production and with imports from America, principally of the lighter machines, the industry was able to satisfy normal demands in peace time, but quite unable to cope with war-time requirements.

44. In those circumstances the essential tasks of the Ministry were to increase the supply of machine tools by manufacture and by importation and to allocate that supply as and where required. On the one hand, existing facilities for manufacture were insufficient and had to be supplemented, design had to be adapted to the simplest forms appropriate for the purpose in hand, and manufacture had to be concentrated on standard patterns, restricting the production of any single works to one or at any rate a few types of tool. On the other, full use had to be

made of all machine tools available, so that they should be used on Government work, and used continuously and where they were needed.

45. A Machine Tool Department was set up under the War Office in April, 1915, and transferred to the Ministry of Munitions in June, 1915, and there systematically organised, with the assistance of a Machine Tools Advisory Committee, consisting of representatives of the trade. The late Sir Alfred Herbert, a leading manufacturer, was in charge of the department from the time of its formation and he served as chairman of the Advisory Committee. As early as March, 1915, it had appeared that only about 50 per cent. of the trade were then engaged on Government work. Others were working on neutral orders and there was evidence that many such orders were destined for enemy use*. Steps were taken to control the trade and to give priority to Government orders; but until July, 1915, the control was general and dependent in practice on the goodwill of the individual manufacturer. In July control was made effective by requiring the sanction of the Ministry (Machine Tool Department) for all machine tool orders. I append as Exhibit I, the circular letter then sent to all members of the trade; it summarises the earlier history of control and states the reason for, and the means of, its extension. The sanction so required for orders was the foundation of the comprehensive plans upon which the Ministry found it necessary to embark. It also served for the control of prices—an imperative need, in view of the shortage of supply.

46. A census of machine tools and numerous visits from officials of the Ministry combined to show, among other matters, that in the spring and early summer of 1915, there were many machine tools usable for the production of munitions which were either not in use or not used to their full capacity. They were moved to other works, where they were needed, or orders were placed to ensure their full use. In fact the whole distribution of machine tools throughout the country was surveyed and re-organised so as to meet the requirements of munitions production, including the important matter of the equipment of the National Projectile and National Shell Factories. I can best illustrate the scope of the Ministry's work in this connection by referring to a document appended hereto as Exhibit J. It is a report made in April, 1916, upon a proposal to institute central purchase of machine tools for National Shell Factories. The writer, reviewing the activities of the Machine Tool Department, concludes rightly that the desired "central purchase" already exists.

47. But the due allocation of existing machine tools was not enough. On an average, in July, 1915, machine tool manufacturers were booked up for the next six months. To meet the deficiency, they were encouraged to place sub-contracts with general engineering firms and with such allied industries as printing machinery manufacturers. This involved simplification of design and considerable care in seeing that the tools ordered and used were not unnecessarily elaborate for the work required. In addition, orders to the amount of £1,000,000 were placed in America and a permit system for imports was used to complete the control of prices. An inevitable result of the sub-contracting system was the inferiority of many of the machines produced, but this defect was largely remedied by time and experience.

I may again point out that the control of the machine tool trade, as regards supply, allocation and use of tools, could only have been effected by the centralised authority of a Government Department, knowing the requirements of production and in a position to survey the trade as a whole and to deal with it accordingly.

48. In order to describe and illustrate the scope of the work of the Ministry, I have had to give the Commission a number of more or less detailed instances and some statistics relating to particular

cases. They are, of course, merely instances and I find difficulty in conveying, within a limited space, the impression of comprehensiveness and the wide field and variety of the essential work of the Ministry—matters clear enough in my own recollection and, I am sure, in that of my colleagues at the time, but difficult to convey within the limits of reasonable space. I think I can best supplement my detailed evidence by appending hereto two documents.

The first (Exhibit K) consists of extracts from a report prepared in the Ministry for the Chancellor of Exchequer, who required, for his budget speech in April, 1917, illustrations of the economies effected by the Ministry. The report accordingly bears on the question of economy.

The second document (Exhibit L) consists of the minutes of a typical fortnightly meeting between the heads of the Departments of the Ministry and myself. These meetings were held regularly, beginning in the autumn of 1916. The one exhibited was on the 1st January, 1917, and the variety of subjects, the methods of dealing with them and, if I may say so, the concise competence of the heads of Departments illustrate vividly what the Ministry had to do and how it was doing it.

49. In connection with the supply of skilled labour, I have already (paragraphs 24-27) mentioned the relations of the Ministry to the War Office. I should also refer to those relations from three other points of view, namely as regards the gradual transference of functions from the War Office to the Ministry so far as they related to the production of munitions, the relations between the design and the supply of munitions, and the need for unity in production. I shall also have occasion to refer as regards these matters to the Admiralty and the Air Board. The questions I propose to discuss will lead up conveniently to the constructive suggestions, based on my experience at the Ministry.

50. The transference of functions from the War Office to the Ministry may be divided into stages.

(1) When the Ministry was first constituted in June, 1915, there were transferred to it from the War Office the following:—

(a) The contracts and labour branches of the Master-General of the Ordnance's Department.

(b) The Explosives Department.

(c) The staff responsible for the inspection of munitions, including the inspection of naval ordnance stores.

(d) Not the administration of the Ordnance Factories, but the assistance of their staff in the work of the Ministry.

(e) Responsibility for trench warfare appliances.

The design, specifications and tests required for munitions were to be dealt with by the War Office and Admiralty respectively.

(2) The next stage was the transfer in August, 1915, of full responsibility for the ordnance factories, which consisted of Woolwich Arsenal, Enfield Small Arms Factory and Waltham Powder Factory. Arrangements were made for keeping direct contact between the factories and the War Office and Admiralty on technical matters.

(3) In August, 1915, the Munitions Inventions Branch was set up in the Ministry and such functions as the War Office had exercised with regard to inventions were transferred to it, it being recognised that final decisions as to whether any particular invention was of practical service and should be adopted and, if so, in what design, lay with the War Office.

(4) In November, 1915, the responsibility for design was transferred to the Ministry. I append hereto as Exhibit M a memorandum and further notes, which I prepared on this occasion. There was a difference of opinion between the War Office and the Ministry as to whether final approval of new designs should be given by the Ministry with or without the concurrence of the War Office in every

* History Min. Mun. Vol. VIII, Part III, page 47.

case. The question was settled by the following decision of the War Council on the 27th January, 1916:—

(a) The responsibility for designs, patterns and specifications, and for testing arms and ammunition rests with the Ministry of Munitions.

(b) The Army Council is responsible for the general nature and amount of the weapons and equipment required.

(c) When it is necessary that new weapons, stores, or articles of equipment should undergo practical trials by troops either at home or in the Field the co-operation of the Army Council should be sought by the Ministry.

(d) The Army Council should be represented on advisory committees or bodies under the Ministry of Munitions to the extent that they think desirable.

(5) In January, 1916, the Ministry took over the responsibilities for all storage until the delivery of the completed shells to the Ordnance Department of the War Office as required.

51. It will be seen that the stages of the transfer represent two developments, the extension of the control of the Ministry to the Ordnance Factories, which had originally been left under the War Office, and the extension of the scope of control to design and inventions. As regards the *relations between design and supply*, I cannot do better than refer to the documents mentioned above as Exhibit M. They state and illustrate the need for one control, since design and its attendant specifications and testings are essentially processes belonging to manufacture and supply.

52. At different stages of the War, owing to the need for increasing centralisation of control and direction with regard to the supply and distribution of materials and the use of labour and machinery, the Ministry had to assume responsibilities for an increasing number of supplies such as tanks, railway materials, locomotives, motor transport, agricultural machinery and aeroplanes. For the present purpose reference need only be made to the case of aeroplanes and aeroplane engines, as it illustrated in a striking fashion the difficulties attendant upon divided responsibility and the advantages which followed a concentration of responsibility.

53. In July, 1916, the Air Board made certain requests for priority in aircraft supplies, which were then under the control principally of the War Office and partly, too, as regards the Royal Naval Air Service, of the Admiralty. Arising out of these requests, there was some correspondence between the Air Board and the Ministry, and in September, 1916, Sir Alexander Roger at my request prepared a memorandum, suggesting that the whole business of aircraft supply should be transferred to the Ministry, and, in the course of reviewing the difficulties then being experienced, gave cogent reasons for so doing. During the concluding months of 1916 the subject remained in dispute between the Air Board, the Admiralty and the War Office, and at different times came before the Cabinet.

The complaints from the Front as to the inadequacy of the supplies continued to increase, but it was not until after the change of Government in December, 1916, that the responsibility for supply was transferred to the Ministry of Munitions.

I instructed a group of principal officers to examine the position and recommend a scheme of work. On their advice I appointed Lord Weir as controller of aeronautical supplies with the late Sir Percy Martin as his chief assistant. It appeared that deliveries of aeroplanes and engines were hopelessly in arrear of orders, and a multiplicity of unassociated orders and a needless multiplicity of variety of types largely contributed to the result. Nearly 8,000 aeroplanes of 48 different types had been ordered by the War Office from 38 separate contractors. The Royal Naval Air Service had another 1,500 aeroplanes and seaplanes on order, of 43 different types (of which 15 were the same as the Army's) from 50 contractors, of

whom 18 were also Army contractors. The two services together had on order 9,483 aircraft of 76 different types from 70 different contractors. There was a similar position as regards engines, of which 57 types were on order. It will be appreciated that such a position arose from the development of the experience and requirements of the combatant services, translated into orders given without regard to the exigencies of commercial production and without unity of view. The difficulties were aggravated by competition between the orders of one Department and those of another, and a lack of unity in the consideration of design, while at the same time the contractors had to meet the demands of the Ministry of Munitions for such similar products as motor vehicles and engines. Out of such an ill-regulated confusion there could never have been sufficient production of aircraft to meet the requirements of the war.

54. It is not perhaps necessary to supply the detailed figures, but by the establishment of unity of responsibility in all matters of design under the reconstituted Air Board (leading to the Air Ministry) under Lord Cowdray, and for unity of supply under the Ministry associated therewith, a great reduction in the number of types was obtained and supplies became abundant. In this case the arrangements differed somewhat from those which had come to exist in the case of other munitions, but they furnish an interesting example of a system that worked well in practice and which represented an association of different departmental interests that soon developed into a smoothly functioning machine. They are set out in the attached Exhibit N of 1st February, 1917.

55. The organisation that was progressively developed at the Ministry of Munitions and the accompanying arrangements were not the result with any of us, I think, of any preconceived notions, but were fashioned solely out of considerations as to what was the best way of overcoming the difficulties that presented themselves and of performing the task allotted to us.

56. The practice previously adopted had been to place contracts on what was called a basis of tender. But so far as the supplies of the more specialised types of munitions were concerned, such as guns, shells, rifles and machine guns, that meant in fact that the transactions were limited to a relatively small group of manufacturers with whom there necessarily came to be established a close working relationship, and there seems to have arisen a sort of understanding as to the prices to be paid for different supplies. So far as I ever ascertained there was no effective competition between these firms as to price, whilst there were many evidences of a fairly close understanding between them. The striking similarity between the prices paid for shells to the large firms with whom the War Office had been accustomed to deal against the much lower prices arranged with outside firms by the Ministry in the first weeks of its existence is an example.

57. The circumstance that induced me in the early days of the Ministry to employ cost accountants was that as Mr. Lloyd George had asked me to take charge of financial matters, I found that neither in the Contracts Department of the War Office nor from inquiries from representatives of the different firms was I able to find anyone who could, or would, give me any indication as to what things cost to make. I cannot over-emphasise either the complete lack of information in this respect or the difficulties it caused. I, therefore, decided to employ those who would be able to inform us as a result of precise inquiries in these factories or workshops which were under our immediate control. This formed the commencement of the cost accounting system. It was gradually developed and it ultimately extended its authority, under my direction, to all departments of supply and manufacture.

58. The cost accounting system was not established without difficulty. It called for the exercise of a good deal of tact on the part of those employed, as well as firmness in their support. In

the course of time, however, it became accepted and worked without much difficulty as a matter of routine.

We did in fact make allowances on the generous side for overhead charges in the case of the old-established munition firms; but in the circumstances of the time I did not press inquiries in this respect so long as we obtained what we felt were fair prices. The prices that we accepted in February, 1916, referred to in paragraph 15, are evidence of this if they are compared with the costs as we found them in our own factories.

59. The regular institution of a system of costings also lead to the revelation of waste in many directions and to a progressive improvement in the manufacturing methods.

60. What the total of the savings effected for the State by the application of this system throughout the life of the Ministry amounted to in the aggregate I am not able to say, but it was undoubtedly a prodigious figure—certainly in the hundreds of millions of pounds.

61. It cannot, I suggest, be questioned that a cost accounting department with similar powers and authority should be an essential part of any department of the State responsible for obtaining supplies—whether those supplies are obtained from state factories or from other sources.

62. When we turn to the best methods of obtaining supplies for war purposes, we have to take account of the nature of the supplies themselves and of the extent to which they are identical with, or akin to, those required for civil purposes. It does not follow that, whilst, say, pig-iron is required for a great number of purposes and at the same time is necessary for guns and shells, we cannot for practical purposes make distinctions between the end products. It would, I think, be quite practicable to classify separately such munitions as are articles manufactured for, and only for, the purposes of war. I will refer to these later as Group A.

63. In another class there are supplies of a lethal type, such as some explosives and certain chemicals which are used in industry and are also of a type required for war purposes. It should, however, be remembered that some explosives required for war purposes are different from those required in industry. These will be referred to as Group B.

64. Beyond these there are many articles which are required in civil industry as well as in war without a change of form, such as, say, glycerine, alcohol and many other materials as well as certain manufactured articles like optical instruments, photographic apparatus and many more.

The proportionate quantities of them that war necessities would call for may, and would in some cases, be very different for those of peace, but I suggest it would not be necessary for present purposes to regard them as munitions of war.

65. It cannot be denied that nine months after the late war had begun, and when every effort had been made to make the system of reliance on private manufacture meet the nation's need, that the system had proved to be a tragic and perilous failure. If we review the supplies forthcoming up to May, 1915, the only place in which deliveries had been up to promises was the national arsenal at Woolwich. (Par. 6.) In that case deliveries had exceeded anticipations whilst in the case of the chief munition firms deliveries were so terribly in arrear that the promises for delivery were a source of danger.

So meagre was the allowance of ammunition for the armies in France that it is probably no exaggeration to say that defeat was only narrowly averted by the heroism of our soldiers under great disadvantages and by the success of our national arsenal. I know of no case in our history where a great industry has been so disastrous a failure in a time of need.

66. Up to May, 1915, the type of the munitions asked for had not greatly altered from anticipations except that there was an increasingly insistent

demand for more. The tank and other inventions had not been developed, although the demand for trench warfare munitions (some of which the private makers professed to be able to supply) was increasingly urgent. Private manufacturers could not, however, in any case be held responsible for developments that were unforeseen and should only be judged in the case of such supplies as they were presumably competent to provide.

67. Their failure in this respect was, I think, necessarily consequent upon the system adopted despite the fact that the inquiries of the Ministry's experts revealed an unexpected degree of industrial inefficiency in their works management in some cases. (See Exhibit C, para. 9 (c)).

68. An analysis of the case reveals the following three main reasons for the failure:—

(a) The system encouraged a reliance upon a limited group of makers and accordingly restrained endeavours to make use of the manufacturing capacity of others.

(b) The firms themselves accepted orders in the hope, no doubt, that by strenuous efforts they would be able to carry them out, but it is certain that these acceptances had not been measured by any expert and impartial examination of their workshop capacities. Their own supplies of machinery and expert labour were quite insufficient. The fact that they made promises they were not able to fulfil and that the system necessarily encouraged the War Office to rely upon those who made the promises is serious in itself, but I suggest that it is not reasonable to expect that private manufacturers should maintain machinery in their workshops in peace time that is not fully used. The anticipations often indulged in of their great potentialities of expansion in war time do not rest upon any serious examination of the nature of the industrial considerations involved.

(c) The firms were unable to obtain adequate reinforcement of their manufacturing capacities either by sub-contracting or by their endeavours to obtain more labour, machinery and materials, and I believe these limitations are inherent in the system. They call for separate notice.

69. With regard to sub-contracting the additions to such supplies as the firms themselves were able to provide that were obtained in this way were less than might have been anticipated and made no substantial contribution to the total output.

The reasons were threefold:—

First: in the circumstances of the time the patriotic impulse of other firms was to prefer to manufacture for the state rather than for a major contractor. This disposition was manifested in the strong demand for a wider spread of war orders that had become very pronounced before the Ministry of Munitions came into existence.

Second: Manufacture depends upon an adequate supply of precise drawings, specifications, gauges, etc., and these the major firms were unable to supply in any adequate measure to their sub-contractors. Indeed, the shortages in these respects, especially in the supply of gauges, involved delays extending over three or four months after the Ministry was constituted before it was able to provide them in sufficient numbers. The provision of a supply of these critical "key" requirements beyond their own needs clearly cannot be expected to be the business of private manufacturers.

Third: The placing of miscellaneous orders to fill the blanks in their own production created confusion in the processes of inspection and assembly and involved activities that were not in line with the ordinary work of manufacturers.

It should be remembered that a completed article like a shell, for example, consists of a great many parts and the processes of co-ordinated assembly and inspection for the provision of completed supply are of vital importance.

The state of affairs that was found to exist can only be described as chaotic, and one cannot imagine how these sections of the work could possibly be efficiently managed except by a central organisation with full knowledge over the whole field.

What applies to constituent manufactured parts applies with even greater force to the assembly and filling in an orderly manner of primers, gains, shells, cartridge cases and the rest which make up a "completed round."

70. Reinforcement in labour, machinery and materials.

Labour.—With regard to the reinforcement of their manufacturing capacity by obtaining additional supplies of labour the private firms were under special disadvantages. There was first the drainage that had taken place generally by enlistment. It included large numbers of skilled workers and gave rise to the efforts subsequently made to secure their return from the Army. Apart from this, an individual firm could only obtain extra labour by taking it away from another. The men naturally preferred if possible to work in their accustomed place, and their employers strove to obtain orders that would employ them. Even with the full machinery of the state, coupled with patriotic appeals, we met with only a small measure of success in the scheme afterwards known as the War Munition Volunteer Scheme.

Machinery.—As with labour so with machinery. It was not possible, save at great cost and to a trivial extent, for one firm to obtain machines already installed in the works of another. There was, of course, a great heaping up of orders for new machinery and new machine tools from established makers, but deliveries had to wait their turn and there was not, and in the nature of the case could not be, any arrangement that secured delivery according to any priority of importance. The position that was found is sufficiently indicated by the fact that the Ministry, as one of its earliest efforts, had to take a census of existing machinery and assume complete control over machinery and machine tool manufacture and supply, as well as their distribution in relation to need.

Materials.—So far as materials are concerned, if war should unfortunately arise it may be predicted with confidence that, as in the last war, the requirements for materials in many important respects would be widely different from those of peace time, both in regard to the relative quantity required of various materials as well as to differences in the form in which they would be required. The state would be compelled to take control both in order to obtain adequate supplies and in order to allocate them as required. Such action also would be necessary to safeguard the community against exploitation.

71. It appears to me to be undoubted that the experience of the late War points not only to the desirability but to the necessity from the point of view of national defence of the establishment of a state department responsible for the manufacture and assembly of all munitions of war strictly so-called. I mean the articles manufactured for, and only for, the purposes of war which I have previously referred to as Group A (paragraph 62). This conclusion is entirely apart from the grave considerations of national policy relating to the undesirability of manufactures of this kind being in private hands for the purpose of gain.

72. There should, I suggest, be a single supply and manufacturing department for all war departments, the following being some of the more prominent considerations:—

(1) There were numberless instances of the difficulties, and sometimes waste, which arose out of different service departments seeking to obtain the same materials as well as machinery at the same time. Because of those difficulties the supply of materials and machinery became progressively concentrated in the Ministry of Munitions. The advantages of unified responsibility are manifest, where imported supplies are concerned.

(2) The disorder and possible waste and loss to the efficiency of supply are equally cogent in the case of manufacture either in national establishments or by private firms. The overlapping of orders and divided responsibility in the case of aircraft supplies is a striking example.

(3) Similarly great economies as well as improvements in manufacturing efficiency are obtainable through a costings system under unified and experienced direction. The difficulties that arose between the Ministry of Munitions and the Admiralty over cordite prices, of which details can be supplied if desired, furnish an illustration of the losses that may arise from divided responsibility.

(4) The processes of transport, assembly, inspection and filling are those in which unless there is unity of direction there must be unnecessary delays and disorder.

(5) The work of design and experimentation is inseparably associated with that of manufacture and supply, and, as the evidence has shown, serious difficulties and delays occurred during the first year of the work of the Ministry of Munitions, because design had not been associated at the start. The records of the Inventions Department of the Ministry (which can be supplied if desired) are a good example of how an alert central department can be directed to make use of and develop not only the suggestions of its own experts but those which come from outside. The cases in which this department assisted to bring up to a workable form suggestions often of quite humble people were very numerous. There were some thousands of cases great and small. It is certain that had it not been for these arrangements very many useful ideas would never have been made use of. The case of tanks referred to by Sir Eustace D'Eyncourt—who was himself the chief designer in the Admiralty—is an example of how a central department (the Ministry of Munitions was responsible for tank supply) was able to make use of and provide facilities for the development and perfection of outside suggestions. The Stokes mortar is another example.

(6) There is a final and most important reason for the existence of such central department as is here suggested, namely, that only by such an agency would it be possible to mobilise and secure the rapid utilisation of appropriate private manufacturing capacities to provide expansion in the case of war. This consideration calls for suggestions as to how such a department would operate.

73.—(1) The department would be responsible in peace time for the supply and manufacture in state-owned factories and establishments of all war munitions indicated in Group A (paragraph 62) and for all manufactures relating to chemical warfare that might arise in Group B* (paragraph 63), and for such others as circumstances or new developments might bring into the category of productions for war use only.

(2) It would manufacture and store such reserves as might be deemed necessary. The number of months of prospective war use which such reserves would be designed to cover would be conditioned in different cases by the rapidity with which supplies could be augmented in the event of war by the increase of state manufacture or by the mobilisation of the resources of appropriate private manufacture.

(3) In the case of some specialised types of machinery it would probably be found desirable also to establish certain reserves for expansion purposes in the state factories since private manufacturers could not be expected to maintain them.

(4) With regard to explosives referred to in Group B, it would, I think, suffice if the state department manufactured the specialised supplies used in chemical warfare and only such explosives as were

* Supplies of a lethal type, used both in industry and for war purposes.

required for its peace time activities and for reserve supply. For expansion in time of war, it should have appropriate arrangements with private manufacturers, who normally produce allied products for a great variety of civil industries.

(5) The department would require to take and keep sufficiently up-to-date records of the quantities, types and location of such machinery and materials as might be required for different purposes.

(6) It would prepare and have available sufficient supplies of drawings, specifications, gauges, etc., as might be necessary to facilitate the expansion required.

(7) It would have in readiness an appropriate classification of private establishments and be pre-

pared with the necessary control orders in respect to them as well as in respect of materials supply.

74. The above suggestions are derived from my experience at the Ministry of Munitions, and not merely from such small part of it as I have had space to set out in preceding paragraphs. The principles I have in mind could be applied to other types of munitions, including naval requirements, as well as to those with which I was more intimately concerned and to which I have referred above. I cannot foresee what questions will present themselves to the Commission as regards the working out of my suggestions, but I shall, of course, be glad to answer any such questions to the best of my ability.

EXHIBITS

INDEX TO EXHIBITS.

<i>Exhibit. Para.</i>	<i>Document.</i>
A 7	29th May, 1915. Shells: promises, deliveries and arrears.
B 13	30th Nov., 1915. Letter illustrating difficulties with contractors.

EXHIBIT A.

Position of the chief manufacturers on 29th May, 1915. Shells only. Completed rounds not included.*

<i>Contractor.</i>	<i>Promised.</i>	<i>Delivered.</i>	<i>Arrears.</i>
Vickers ...	907,550	235,550	672,000
Armstrongs ...	1,020,925	308,000	712,000
Firths (Washington) ...	170,700	21,700	149,000
Firths ...	71,300	17,450	53,850
Hadfields ...	30,200	22,000	8,200
Cammell Laird... ..	42,800	6,200	36,600
Projectile Co. ...	289,350	185,844	103,506
Dick Kerr & Co. ...	73,500	14,400	59,100

* Shells only are taken as being the easier to manufacture. If "completed rounds" are included the position is worse.

EXHIBIT B.

Cyclops Steel and Iron Works,
Sheffield.
30th November, 1915.

SIR,

We have the honour to refer to your letter 94/S/676 dated 19th November, and to the interview when Mr. Allen and Major Handley were present which took place at your office on the 29th November.

At that interview we explained our interpretation of the position of the two contracts which have been placed with us, viz.: S/6980 and 94/S/6 for 18 pounder High Explosive Shell.

Our contention is that at the time the contracts were placed it was understood that supply was to continue for a period of not less than the duration of the war. In this connection we produced certain official correspondence and letters which have passed between representatives of this firm and officials of the War Office (by whom the contracts were originally placed) and of the Ministry of Munitions, and in our opinion, the documents support our view.

On the other hand, it was pointed out to our representatives that the clause empowering the Secretary of State for War to give notice to discontinue delivery did not coincide with those views. Taken, however, in conjunction with the correspondence, as well as the recollection of statements made at personal interviews, we hold that this clause was inserted to protect us by making provision for the disposal of any stocks of material on hand, in the event of a sudden termination of the war and was on that account not intended to define or limit the period of the contracts themselves.

Further, with regard to modification in the price of the shell, which your letter under reply suggests, it was pointed out that in our view the contract itself defines the price of each shell, for it states that the sum of £1 (one pound) shall be paid for each shell delivered after specifically named dates. This sum, as mentioned in the correspondence, is open to further consideration under certain conditions, namely: on the one part, if an unexpected rise or fall in wages takes place, and on the other part, should there be an unforeseen advance in the cost of material.

In special connection with contract 94/S/6, we desire to add that definite sub-contracts have been placed by us with four manufacturing firms, for which your approval was obtained. When placing these contracts, we understood that our relations with these four firms both as regards supply and price of shell would be governed by the conditions, as we understood them, of our main contract. Any alteration, such as your letter of the 19th instant suggests, would therefore act prejudicially towards the understanding existing with our sub-contractors.

We therefore trust that the explanation given of our views of these contracts may be deemed satisfactory, and may be accepted as representing the conditions under which our 18 pounder extensions were proposed, erected and installed.

As mentioned in our letter of November 22nd, and as explained at our interview, we desire to assist the Ministry in every way, and if the machines, with any space that may be found available, make possible in our own works the substitution of 18 pounder Shrapnel for 18 pounder High Explosive Shell, we shall submit a detailed proposal for your consideration.

We are, Sir,

Your obedient Servant,

CAMMELL LAIRD & CO., LIMITED,

(Signed) A. HANDLEY,

Director.

EXHIBIT C.

(Armament Firms—Shell Prices.)

Secret.

MINISTRY OF MUNITIONS OF WAR.

Minutes of Meeting of Committee upon general problems arising in connection with expenditure of the Ministry.

The Committee met again on Monday, 24th January, 1916.

Present:

Mr. S. H. Lever.
Hon. N. Charles Rothschild.
Mr. John Mann.
Mr. Frederick Palmer.

Attending:

Mr. Arthur Collins, Secretary to the Committee.

The question of prices of shell to the Armament Firms was discussed and the following statement was approved:—

1. *Reduction in Shell Prices.*—In the latter part of last year evidence had accumulated that prices originally paid and still current for shell were giving a more than liberal margin of profit to the manufacturers. This was shown by actual costs submitted by some of the contractors, mainly engineering firms, who have taken up shell manufacture since the War. This conclusion was confirmed by the members of several district area organisations engaged in shell manufacture. Further, in December, 1915, the costs of shell manufacture in some of the national shell factories became available. This accumulated information was closely scrutinised and table of costs was framed for each kind of shell. In arriving at these costs the production department was requested to base the calculations on a plant equipment of an average nature, in order to yield a rate of cost not so low as could be reached by the best practice, yet on the other hand, not as high as an ill-equipped maker might require to pay.

2. *Armament Firms.*—In the light of this information, intimation was given terminating all "running contracts" on the expiry of the prescribed notice—generally three months. The following armament firms were invited to quote reduced prices to take

effect on the expiry of their "running contracts" and of other contracts terminating on a fixed date, namely:—

Sir W. G. Armstrong Whitworth and Co., Ltd.
Vickers, Limited.
Thomas Firth and Sons, Ltd.
Hadfields, Limited.
The Projectile Co. (1902), Limited.

Meetings have been held with each of the firms except Messrs. Armstrongs, who have so far not consented to discuss any reduction—probably awaiting the result of negotiation with the others. The general result of these meetings was that the firms, with the exception of Armstrongs, admitted that some reduction could be made, but it was evident that the views of the contractors as to prices were widely different from the views of the Ministry, based upon the cost of production.

The contractors stated that they did not desire any unreasonable profit; the Ministry, on the other hand, offered a reasonable profit and followed up by suggesting that the contractors should submit their actual manufacturing costs in order that a reasonable profit might be arranged. In every case this suggestion was emphatically rejected although it was repeated on several occasions. Some information was ultimately submitted but it was obviously of little value and all really helpful information has so far been withheld.

In no case has any reference been made to the powers being sought in the Munitions (Amendments) Bill for investigation of books to ascertain costs.

It may be mentioned that the firms were also asked to state what they deemed a reasonable rate of profit, not upon capital but upon the cost. Messrs. Hadfields, Ltd., intimated that they would be satisfied with 10 per cent., while Messrs. Vickers, Ltd., suggested 20 per cent. upon cost. It is obvious that even 10 per cent. on production would represent a very high return upon the capital employed.

3. *Volume of Production.*—Bearing in mind the urgency of an increased output of shell, the Committee point out that the greater the volume of production the more the cost per shell will be reduced.

4. *Early Prices and present Cost.*—The following is a contrast between the prices paid at present to the five firms above referred to, and the table of costs:

Shell.	Estimated Cost (Average practice) + 10 per cent. for Contingencies.	Prices proposed by Ministry.	Armament firms present prices.				
			Armstrong	Vickers.	Firth.	Hadfield.	Projectile.
	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
18 pdr. H.E. ...	11 3	12 6	Not fixed.	20 0	—	23 0	—
4-5" H.E. (Mk. V. and Mk. VI).	27 0 to 29 0	34 0 (+ change over 1s.).	47 0	52 0	60 0	63 9	65 0
60 pdr. H.E. ...	42 4	47 6	60 0	63 0	70 0	82 4	—
6 inch H.E. ...	61 0	68 0 (+ change over 6d.).	80 0	—	99 0 U.S.A.	—	90 0
8 inch H.E. ...	125 6	142 6*	—	—	240 0	—	—
9-2 inch H.E. ...	193 0	210 0*	262 6 (+ plant)	287 0	—	305 0	295 0
<i>Shrapnel.</i>							
13 Pdr. Sh. ...	13 0	14 3*	—	16 0	—	—	15 6
18 Pdr. Sh. ...	17 0	18 6*	17 6	17 8	—	—	20 0
60 Pdr. Sh. ...	51 5	56 0*	—	67 6	75 0	—	60 0

* Not yet offered to Contractors.

5. *Contractors' Contentions.*—The Armament Firms seek to justify their claims for a scale of prices higher than those paid to other firms on two main grounds, namely:—

(a) that they have rendered special services to the Government by prompt delivery of shell in the great emergency at the outbreak of the War, and that they produce thoroughly high class work. This has been freely recognised and appreciated by the Ministry's representatives,

but it has been pointed out that the prices—very generous prices—hitherto paid, have provided full compensation for any such special assistance.

(b) that their establishment charges are necessarily very much higher than those of an ordinary engineering firm and of other manufacturers making shells, because:

(1) they have to support in some cases a costly world-wide selling organisation;

- (2) they maintain an expensive general office and drawing office organisation;
- (3) that some of their chief departments, e.g., Armourplate, are not fully employed.

In reply it has been pointed out that the departments, other than shell making, doubtless yield a rate of profit sufficient to bear those special expenses and it is unreasonable to burden the price of shell with a rate of general expense which does not apply and is higher than that of other shell manufacturers. Further, it was argued that as results vary from year to year it is understood that ample reserves have been accumulated to meet the abandonment or temporary suspension of the manufactures such as armourplate.

There is reason to believe, although the point has not yet been raised, that in the case of Vickers, at least, the cost of world-wide selling organisation upon which they have laid so much stress, has been amply met by the commission earned on orders placed in America for the British Government. At one juncture a contractor complained that the Ministry was now compelling acceptance of prices lower than those paid in peace times when costs were much lower. The obvious retort was made that such prices could not have been truly "competitive" prices such as those now offered by other makers—*notwithstanding the enhanced costs to them.*

6. Uniform Prices.—The suggestion was made that the same prices should be paid to all the firms referred to, but there are obviously grave difficulties in adopting this course. For instance, some firms contend that they have special local difficulties, such as high piece-work rates, which cannot be reduced, or again, in the class of the plant employed. Others have been assisted in the purchase of plant by large Government grants (in some cases repayable and in some not repayable). The Projectile Company claim that their labour costs are lower than the Sheffield rates, but they declined to admit this as a reason for accepting a correspondingly lower price. In short, a uniform price, while giving a fair profit to the least favourably situated contractors, would give an excessive profit to the most favourably situated contractor and therefore injustice would be done to one or other of the contracting parties.

7. Present position of negotiations.—In every case the negotiations have reached a stage where it rests with the contractors to give a decision as to submitting their costs or submitting fresh quotations. There is reason to believe that members of some of the firms have been approaching several departments of the Ministry, evidently with a view to bringing indirect influence to bear which they hope may result favourably to them. It is obvious that if such overtures are not discouraged the negotiations will be seriously prejudiced.

8. Production uninterrupted.—In cases where contracts were on the eve of expiry, temporary renewals

have been arranged on the agreement that whatever prices were ultimately fixed, such prices would be retrospective. In one case a relatively high price was agreed upon in order to prevent any interruption of production. All the firms have been told that it is the wish and desire of the Ministry to take full advantage of their utmost capacity on the understanding that suitable prices will be ultimately arranged, and there is no reason to think that there has been any slackening of production. If the analogy of wages disputes is extended to price disputes, the contractors may be required to continue full production during negotiation, just as they require their own men to continue at work during wages arbitration.

9. Conclusion re armament firms.—The only conclusion that can be reached at present is that:—

- (a) Past prices have contained an excessive profit which they are probably unwilling to disclose.
- (b) Their system of cost accounting is in some cases incomplete and illusory and, if corrected, would disclose the actual costs.
- (c) The organisation and management of their works are inferior to those of other shell manufacturers.

10. Proposed procedure.—The procedure would therefore seem to be to adhere to the request for accurate recent manufacturing costs; verify them if necessary under the new powers and offer a reasonable profit of about 10 per cent. upon the ascertained costs. An alternative method which may be suggested is a co-operative form of contract which has proved acceptable to several of the new shell makers. Under it the shells are charged at actual cost with an addition of a fixed sum per shell to encourage production and to encourage economy, a proportion of the savings between the actual cost and a fixed maximum payment or standard price. A meeting with all the firms is not desirable, but need not be refused if requested. Conditions seem to vary so much that separate negotiations are necessary in every case.

11. Wm. Beardmore & Co., Ltd.—With regard to Messrs. William Beardmore & Co., Ltd., the position is rather different, because from the beginning of the War they have been actively manufacturing various types of shells without any definite contract. Prices have now been agreed upon a substantially lower scale than those provisionally arranged and lower than the prices other armament firms were receiving. The Department was very fairly met and a scale of prices was adopted up to 30th June, 1916, which under all circumstances was admitted to be reasonable.

12. Recent contracts.—The larger shell contracts recently placed are:—

	Contractor.	Output per week.	Price.
18 pdr. H.E. ...	Austin Motor Co., Ltd.	20,000	s. d.
	Cravens	8,000	12 6
	Dorman Long	20,000	12 6
	Beardmore	32,000	12 6 (plus 1s. for plant).
			12 6 (plus 1s. 6d. for plant).
4.5" H.E. ...	Beardmore	6,000	s. d.
	Humber, Ltd.	4,000	40 6 (including plant).
			Cost plus bonus
	Standard Engineering	1,500	Maximum 42s. 6d.
	Sheffield Simplex	8,000	do 42s. 6d.
			42 6 (less depreciation).

13. *District Area Organisation*.—A reduced scale of prices was issued on 5th January, 1916, under which the following contracts have already been placed:—

	Boards of Management.	Output per week.		Average Price. s. d.
		Total.	Average per firm.	
18 Pdr.	Coventry Manchester Leicester East Anglia (Total contract)	8,100	675	14 8

Minute of Meeting, Monday, 31st January, 1916.

Present—

Dr. Addison (in the chair).
 Sir Frederick Black,
 Mr. Lever,
 Mr. Hanson,
 Mr. Mann,
 Mr. Jenkins,
 Mr. Kellaway,
 Mr. Barlow,
 Sir Vincent Caillard,
 Sir Trevor Dawson,
 Mr. Morris,
 Mr. Hichens ... } Messrs. Vickers.
 Admiral Otley ... }
 Mr. Noble ... }
 Mr. Clarke ... }
 Mr. Jack ... } Messrs. Hadfields.
 Mr. Hoyle ... }
 Mr. Cayley ... } Messrs. Firth.
 Projectile Co.

The representatives of the firms had been invited by Dr. Addison to attend in order that the Ministry might ascertain their views in regard to the prices of the more common types of shell, about which negotiations had already taken place with the individual firms.

Dr. Addison said that there were three possible ways of fixing the prices for shells—

- (1) to agree on a uniform price;
- (2) to ascertain the cost in each case and allow an agreed percentage over it for profit;
- (3) a "co-operative" scheme, such as had been agreed on with some Scottish firms; the Ministry pays the cost of material and labour and the actual establishment charges plus a certain bonus per shell and, in addition, allows one-fourth of any reduction in cost below a fixed maximum charge per shell.

He said that the actual costs of production in Government factories have been definitely ascertained. Mr. Cayley, Mr. Hichens and Mr. Jack urged the point that the cost of production was very much greater in an old-established firm than in a small new factory erected for one special purpose and that there were special charges, e.g. for experimental work, gun ranges, submarine testing stations, which should be taken into account.

Mr. Jack added that some regard should be had to precedent. The War Office in peace time had given Hadfields millions of pounds worth of orders at 25

per cent. profit which means really 33 per cent. Dr. Addison agreed that full allowance should be made for such costs of the kind mentioned as could properly be charged to the production of shells under consideration, but he could not admit that, e.g., any part of the cost of a submarine testing station should be included in the cost of shells.

Sir Trevor Dawson suggested that the difficulty of agreeing on the amount to be allowed for establishment charges should be met by the Ministry accepting the statement of the firms' auditors. He thought that Vickers, at any rate, had given all reasonable information to the Finance Department.

Dr. Addison said that he could not express an opinion on this proposal until he had seen it in writing.

Messrs. Firths' representative said that the firms are prepared to accept a smaller percentage of profit than in normal times, but that the Ministry of Munitions' offers are below the minimum net cost of working. He and Mr. Hichens suggested the appointment of a committee, including representatives of the manufacturers, to fix prices. The system of bargaining separately with individual firms is unsound in principle. Dr. Addison said that he was not prepared to agree to the appointment of such a committee.

After further discussion, Dr. Addison handed round a list of the prices of shells fixed by the Finance Department for deliveries up to the end of June, explaining that these were based on ascertained costs and were not to be regarded as minimum prices or as a basis for bargaining. Large firms had already taken substantial contracts at these, or in some cases at lower prices. In reply to inquiries he refused to give the names of these firms without their permission. He emphasised the point that if any firm was not prepared to take orders at these prices they must satisfy the Ministry that their reasonable costs were in excess of those on which the prices were based. Full information as to the Ministry's costs will be placed at the disposal of any firm and allowance would, of course, have to be made in individual cases for any capital advances which might have been made.

The representatives of the firms agreed to consider the prices among themselves and to come back with their observations on Thursday, February 3rd, at 3 o'clock.

Dr. Addison referred to the urgent necessity for an economical use of labour both by the firms themselves and by their sub-contractors, and handed round advance proofs of the pamphlet illustrating the use of women's labour.

18 Pdr. Sh. ...	18s. 9d.
60 Pdr. Sh. ...	55s.

Note.—On basis of Steel at £15, Bullets £44 per ton; variations to affect prices corresponding.

Prices based on Cost including 33½ per cent. per annum depreciation on plant; 10 per cent. on buildings and interest at 6 per cent. on working capital. Repairs to plant (exclusive of small tools separately allowed) at 10 per cent.

Prices are on the basis of steel at £15 per ton uncut for sizes up to and including 6" or £16 per ton cut into billets of not less than 43 lbs. For steel over 6" up to and including 9.2" £16 10s. uncut or £17 10s. cut into billets. For steel above 9.2" £17 10s. uncut or £18 10s. cut.

EXHIBIT E.

MINISTRY OF MUNITIONS.

Estimate of saving resulting from recent negotiations as to prices of Ordnance Cordite.

1. The following statement shows the reduction in price per lb. of ordnance cordite agreed in respect of the Misk Factory as compared with

- (a) Pre-war prices.
(b) Prices in 1915.

	Price per pound.			Saving per lb. compared with	
	Pre-war Price.	Price in 1915.	New Price.*	Pre-war Price.	1915 Price.
M.D.T. 20/10	s. d.	s. d.	s. d.	s. d.	d.
M.D. 16 and above	—	2 9	2 2	—	7
M.D. 11	1 10½	2 3	1 8	2½	7
M.D. 8	2 0	2 4½	1 9	3	7½
M.D. 4½	2 0	2 4½	1 9½	2½	7
M.D. 2½	2 2	3 1½	2 2	—	11½

* *Note.*—(1) The new price includes a special allowance to Nobel's Company of about ¼d. per lb. for extra cost

of carriage which it may not be necessary to allow to other contractors.

(2) The new price as stated above does not include any allowance in respect of the risk as to loss from explosion which under the new arrangements the Minister is to bear.

2. The average reduction compared with 1915 prices may therefore be taken as 7.25d. per lb.

In considering this figure regard should be had to the following facts:—The present cost of raw materials is 5d. per lb. of cordite in excess of the cost in the pre-war period and 3.2d. per lb. in excess of the cost in the latter part of 1915.

3. The total production of cordite from private firms in the United Kingdom is expected to rise to 5,473 short tons per month in the latter part of 1916.

Ministry contracts	... 2,863 short tons per month.
Admiralty contracts	... 2,610 short tons per month.
	5,473 short tons per month.

4. 1d. per lb. on annual production by the firms at this rate will equal £547,000 per annum.

Ministry contracts	... £286,000 per annum.
Admiralty contracts	... £261,000 per annum.
	£547,000 per annum.

5. The total saving in a full year on Ministry and Admiralty contracts when the result of recent negotiations is fully applied, taken at 7.25d. per lb. on the above production, is on—

Ministry contracts...	... £2,073,500
Admiralty contracts	... £1,892,250
Total	... £3,965,750

Issued to all Members.

DEAR SIRS,

Detailed manufacturing costs, and placing contracts without prices.

I am directed to inform you that, in connection with the above matters, the Central Council hold the opinion that pending a settlement it is important that all Controlled Firms should continue to resist all demands for detailed manufacturing costs, and should press on the Government that, save in cases of exceptional urgency, prices should be fixed before orders are placed.

Yours faithfully,

(Signed) STAFFORD RANSOME,
Secretary.

REPORT OF EXPLOSIVES DEPARTMENT ON RAW MATERIALS ESSENTIAL TO THE DEPARTMENT.

Phenol.—U.K. production now about 5,000 tons, all urgently wanted for the manufacture of picric acid, nothing should be used for any other purpose except under extreme necessity.

Tolual.—Whole production urgently wanted, at present small quantity being used for dyes, this will probably have to be stopped later.

The above two products have been entirely under Government control for some time past.

Benzol.—Will probably sooner or later all be required for explosive purposes, either for ourselves or Allies. Fairly large quantities are being used for the production of aniline dyes at present, this will probably have to be curtailed in the near future.

Naphthaline.—Used for dyes and the preservation of skins and hides, while this is not used by our Government, it is used largely by the French and is of the utmost importance to them, their position should be protected.

Glycerine.—It is probable that the whole production of the U.K. will be required for explosive purposes.

Cotton Waste.—Very large quantities will be required.

Nitrate of Soda.—Very large quantities are required for nitric acid making, and otherwise in the manufacture of explosives, and a considerable reserve is now being held by this Department but it is not desirable to draw upon this if it can be avoided.

Caustic Soda.—Large quantities will be required shortly for the manufacture of synthetic phenol.

Pyrites.—Large quantities will be required for the manufacture of sulphuric acid. A considerable reserve has accumulated in this country by the Department.

Potash and its compounds.—Large quantities are required for gun-powder and also for various explosives. The supply of potash is very short.

Acetone.—The whole production will be required for explosive purposes.

Aluminium.—This Department needs large quantities of the powdered and granulated qualities. It is however covered by purchases to the end of 1916 as regards the former (according to the present scale of production), and to the end of the year as regards the latter.

(Signed) R. SOUTHERN HOLLAND.

Explosives Department,
Ministry of Munitions.

EXHIBIT I.

Ministry of Munitions.

24th July, 1915.

GENTLEMEN,

The Army Council, by an Order dated May, 1915, instructed you to divide all orders for machine tools into two classes, "A" and "B," and instructed you to give precedence to Class "A."

A subsequent Order of the Army Council further instructed you to accept no orders for machine tools, except for British and Allied Governments, their contractors and sub-contractors, without the express permission of the War Office, and further instructed you to make certain returns as to work in progress.

In view of the continued heavy demands for machine tools for the manufacture of munitions of war, it has now become necessary for the Minister of Munitions, in the exercise of the powers conferred on him by the Ministry of Munitions Act, 1915, and by the Ministry of Munitions Order, 1915, and with the assent of the War Office, to assume more complete control over the machine tool trade of the country.

I am, therefore, to instruct you that, from this date, you are to accept no orders for machine tools from any government, person, or persons whatsoever, other than the Minister of Munitions (or such Department or Departments of the Ministry of Munitions as the Minister may authorise), the Admiralty, or the Army Council, except with the express consent of the Minister of Munitions (or such Department of the Ministry of Munitions as aforesaid).

I am further to instruct you that you may, at the discretion of the Minister (or of such Department as aforesaid), be required from time to time to suspend or divert any work of any description which you may have in progress, or to cancel any orders which you may already have received.

I am,

Gentlemen,

Your obedient servant,

H. LLEWELLYN SMITH.

EXHIBIT J.

D.G.M.S. D.D.G.A.

19th April, 1916.

NATIONAL SHELL FACTORIES.

CENTRAL PURCHASE.

The question of purchasing machine tools for the national shell factories appears to me to be the much bound up with the purchasing of tools for

other national purposes, such as the national projectile factories, filling factories, gun factories, small arms factories, torpedo factories, and with purchases for the Admiralty and for private firms and companies who are employed on urgent war work.

At present the supply and distribution of all the machine tools made in the country, or purchased from abroad, is controlled by the Machine Tool Department, which has the power of controlling the acceptance by makers in Great Britain of all orders for machine tools from whatever source they may be received.

When obtaining machines for national shell factories, it is frequently possible to divert to the shell factories machines already purchased by the Ministry, or put in hand by the machine tool makers for other requirements which may not be ready to receive the machines.

One of the objects of the Machine Tool Department is to secure that all machine tools made are put to work as early as possible, so as to get the earliest attainable production. The national shell factories are thus frequently provided with machines originally intended for other factories, this being possible owing to the fact that the requirements of all factories of whatever kind are continually under the eye of the Machine Tool Department.

At the present time the Machine Tool Department acts as a general clearing house for machine tools, and I think should be permitted to continue to act as such in obtaining machine tools for National shell factories.

The Machine Tool Department has, in the past, worked very harmoniously with D.A.O. and has received great and valuable assistance from the Area Engineers attached to A.M.3, and my view is that the desired "central purchase" already exists.

With regard to the future, the greater part of the purchases of machine tools for the national shell factories have already been made, the remaining purchases being mainly for the purpose of balancing plants, replacing machines worn out, or replacing unsuitable machines, and providing for such extensions of output as may be sanctioned from time to time.

I give below a brief outline of the method of purchasing machine tools for national shell factories:—

The requisition is usually received, in the first place, from the factory and is in all cases referred to the Area Engineer for his approval. If the Area Engineer and the Machine Tool Department approve, arrangements for the purchase are made by the Machine Tool Department, the actual order being placed by the factory. D.A.O. are frequently consulted in these matters and the advice and assistance of D.A.O. is always welcomed.

The prices at which orders for machine tools are placed are always investigated, and the Machine Tool Department, in many cases, has enabled substantial reductions in cost to be obtained.

Records of the numbers of machine tools already delivered to each factory are now being compiled by the Department, and the intention is to keep continuous records of all machines delivered and yet to be delivered, so that the exact position of each factory may be known from week to week.

Inspectors are stationed in the various districts where the machine tools are made, who constantly visit the makers' works and report progress, and, in many cases, arrangements are made to assist those who are backward by transferring part of their orders to other firms who are in a more favourable position to deliver.

EXHIBIT K.

Economies.

The matter of economy effected by the Ministry is a wide subject but I take it you simply want a few heads which can form a basis for argument.

1. National Factories¹

2. *Co-operative Contracts.*—A statement² is attached in regard to the "Glasgow Shell Scheme" which was a scheme instituted by the Ministry under which contractors were paid on a basis of cost with a bonus for keeping cost low. You will see that the contractors have produced big shells at a cost of one and a quarter millions which at contract prices ruling would have cost one and a half millions, i.e., a saving of a quarter of a million in very much less than a year, on a capital of half a million.

3. *Reduction of Contract Prices.*—A further statement³ is attached showing reduction effected in the price of shells to principal armament firms. It will be realised that the principal cut occurred early in 1916 but the prices have again been reduced and this will result in a saving of half a million pounds as compared with 1916 figures notwithstanding the very large rises in wages which have occurred in the meantime. A further statement⁴ is attached showing the result of certain negotiations in regard to contracts for filling gun ammunition. You will see that these negotiations have resulted in a saving at the rate of £370,000 a year. This, of course, is only typical of negotiations which are constantly in progress and they are dependent almost entirely on the excellent results which we have obtained by examination of contractor's costs.

4. *Cost Examination.*—Investigations have been made into the cost of certain goods and services carried out by contractors for the Ministry. Between four and five hundred of these investigations have taken place and the results are of inestimable value both in negotiating with contractors and for the purpose of forcing prices down. For example, after a recent examination into the cost of brass rod and brass stampings the firms interested in this work agreed to a reduction of prices which has resulted in a saving at the rate of £300,000 a year. Important reduction in prices asked by contractors for aircraft material have similarly been effected and the principle is now being applied in every branch of the Ministry's work to effect reduction in the cost of goods obtained by contract.

5. *General Result.*—In our estimates for 1917-18 we have taken as the cost of gun ammunition a total of £413,000,000. If we had estimated the cost of the same quantities of this ammunition at the prices ruling in March, 1916, the total would have been £456,000,000 which shows a reduction of £43,000,000. This saving is notwithstanding the increased cost of labour which on a very very rough calculation is estimated to represent another £28,000,000. The net saving of £43,000,000 is due (1) to reduction in contract prices £10,000,000, (2) to more extended use of amatol and an increased proportion of ammonium nitrate in the amatol £21,000,000, and (3) to the supersession of brass by iron £12,000,000.

¹ Omitted. This subject has been dealt with in paras. 19, 20 above.

² Omitted: the effect of the statement is summarised in the text.

³ Omitted: see paras. 13-16 above.

⁴ Appended hereto, as examples have not previously been given.

EXHIBIT L.

MINUTES OF PROCEEDINGS OF THE MINISTER'S SIXTH
FORTNIGHTLY MEETING WITH HEADS OF DEPART-
MENTS.

Ministry of Munitions, London, S.W.

Monday, 1st January, 1917.

The Rt. Hon. Dr. C. ADDISON, M.P. in the Chair.

The Minister: Gentlemen. Perhaps you might be interested to have a digest of the Report which has come in as to the German effort in the production of munitions. It appears that orders have been given to double a large number of munition factories, and the general programme aims at increasing the output of guns five times. One of their chief difficulties has been the shortage of labour, but they have called back a large number of skilled men from the colours, and they are greatly increasing the number of women employed in munition factories, and of course they are importing, as you know, a number of Belgian, Polish and French civilians. The machine tool trade in Germany is more active now than it has ever been before during the course of the War. Several new factories are now being got on with, apart from the additions to existing factories. At present their daily output of shell (I think this includes Austria too) is about half a million, and their programme is to double that daily output.

Colonel Milman: A million a day?*The Minister:* Yes.*Sir Alexander Roger:* Is that the programme of the Central Powers?*The Minister:* That includes Germany and Austria. Bulgaria and Turkey do not count much in shell production.*Sir Alexander Roger:* But that applies to both of them?*The Minister:* Yes. Apparently there is no shortage of raw material now, but what there may be when they double their shell output I do not know.*General Bingham:* Except ingredients for making high grade steel.

The Minister: I think they are short of tungsten, and some of those things, but they get them from Norway and Sweden, do they not? Our information is that it is not anticipated that they will be held up for raw material. They are converting a large number of factories in Austria to various purposes connected with the war—glass, earthenware, wood factories, and so on. During the last quarter they have increased the number of workmen at Essen by 25,000 or thereabouts. There is a great demand for molybdenite, and there is a shortage of rubber. However, I think that is a sufficient summary to show you gentlemen that the Ministry of Munitions has got to keep its coat off.

Now let me take the minutes of the last meeting, which, of course, have been circulated. I do not know whether anything arises out of them. Smoke mixture and chemical shell are our fortnightly friends. Have you anything to say on smoke mixture, Sir Alexander?

Sir Alexander Roger: The difficulty in connection with smoke mixture so far as supply is concerned has not yet arisen, because we have not had so many shells to take up the smoke mixture. We are still waiting for shell a good deal.

The Minister: How about the 4-inch bombs?*Sir Alexander Roger:* That has really turned the corner I am thankful to say. The supplies of 4-inch bombs ought to come in now as we anticipated.*General Bingham:* 5,000 a week.*Sir Alexander Roger:* It has not reached that yet, but it is very much on the way.*The Minister:* Have you any alternative smoke mixture which does not require aluminium?*General Bingham:* No, there is not one. We have tried zinc powder, but it is no good. None of the chemists can seem to see anything which will really take the place of aluminium and KNO₃ in the mixture.

The Minister: Is there any further progress in regard to diminishing the amount of amanol?

Mr. Price: It is a question of making arrangements for edge runners. The factories which make the amanol have not the edge runners which the present specification demands. S. of R. is going to see whether amanol made without edge runners is satisfactory.

General Bingham: We are actually getting stuff for trial.

The Minister: How much aluminium will that save?

General Bingham: As a rule you have 17 per cent. of aluminium in amanol, and we were trying to reduce it to 2½ per cent. This will not take it away altogether. I do not know the quantity it will save.

Sir Alexander Roger: We use about 2,500 tons a week of amanol.

The Minister: What is the proportion?

Sir Alexander Roger: 17 per cent. is 400 and some odd tons.

The Minister: It would nearly meet the smoke mixture demand, would it not?

General Bingham: At present, but I am perfectly certain that the smoke demand is going to increase very largely. They had a very successful go the other day with it.

The Minister: How is phosphorus going on?

Sir Alexander Roger: Quite well. I made a report to you about it to-day. The arrangements are well in hand, but you must not expect an increase in the quantity of phosphorus in less than 6 months.

The Minister: Oil supplies. I might report to the meeting that after seeing Mr. Burton Chadwick, Sir Frederick Black, Sir Ernest Moir, and other gentlemen, it was quite evident that there was a serious wastage of oil going on between the different Government Departments. Mr. Burton Chadwick and Professor Cadman put up a scheme which would result practically in the formation of one oil organisation, for distribution and making the best use of our supplies. One very illustrative fact emerged, which was that they produce, I forget how many thousand tons, nearly a hundred I think, in the Scottish shale oil distilleries, of creosote. Is that right, Sir Ernest?

Sir Ernest Moir: Yes.

The Minister: This stuff is sent mainly in tank wagons to the South of England, but at the same time the Admiralty is importing creosote from somewhere or other on the West coast and sending it by tank wagons to Aberdeen. It happens to be dealt with by two different departments. I think there are other illustrations of that.

Sir Frederick Black: Yes.

The Minister: They are not so much to the point as that, perhaps, but still we hope to get the oil organisation properly centralised. Are there any points arising out of the minutes of the last meeting which anybody wants to raise?

The first point on the agenda is the Report on Metal Supplies and Requirements. I am glad to say that I have received a report from the Metals Economics Committee, which, if it receives the benediction of the Ordnance Committee and is put into effect, should result in a saving of a very large mass of copper. I will not state the figure now in case we should be disappointed afterwards, but it is a very large amount. I will deal with these points on which I have one or two questions to ask. Brass. We will take with that the proposed Copper Order. It was suggested that we should have an Order, of which Sir Worthington Evans should put up to me a draft (which I am afraid I did not think went far enough) which proposed to limit dealings in copper and brass. Would it not be desirable to have some machinery for ascertaining stocks other than those which have been allotted priority certificates. The scheme as I understand it (Sir Worthington Evans will correct me if I am wrong) is that a man should declare the amount which he has other than that covered by certificates.

Mr. Llewellyn: We have altered that.

Sir Worthington Evans: It has been re-drafted this morning, and, in accordance with your view, it is now not merely a declaration of the balance, but it is a declaration of the gross total, showing separately how much has either been sold for the purpose of A. and B. certificate work, or if the copper is in the works of the refiner who also does the following processes, how much has been allocated for those following processes, A. and B. work, and then the balance. So that the returns made to you will show three things: the first section will be for A. and B. work other than in the owners' works; second, how much has been allocated in the owners' works for A. and B. work; and, third, the balance left. I think I ought to tell you that Mr. Budd thinks that that return, unless read with knowledge of the people who make the return, may become misleading, because it will be almost necessarily guess-work on the part of some of the people who make the return, but, on the whole, both Mr. Llewellyn and Mr. Budd finally agreed that the Order should be in that form.

Mr. Llewellyn: I think Mr. Fielding will probably be able to tell you better than I can, but there is a certain amount of copper which cannot be considered as available—I mean copper in the furnaces. They may return their stocks of so many hundred tons of copper, and yet in one furnace alone there may be 100 tons at the bottom which is never available. I think that is the idea Mr. Budd has in his mind.

Sir Worthington Evans: Read intelligently, the return will tell you what the three classes are, but read as totals it might be misleading.

Mr. Fielding: Each refiner will make a note "Such and such a proportion is in furnace bottoms and is not available", but the whole thing will not amount to 5,000 tons in the whole of England.

The Minister: What about manufacturers' stocks, Mr. Fielding? Do they amount to anything?

Mr. Fielding: Current stocks?

The Minister: Yes.

Mr. Fielding: All the refiners will have large stocks, and all the manufacturers will have stocks.

The Minister: You will get details of that?

Sir Worthington Evans: Yes the Order covers that.

Mr. Ellis: And the metal brokers as well.

Sir Worthington Evans: The dealers have already made a return, but I think this return will be really inclusive of previous returns. It will be a new return covering everything.

Sir Ernest Moir: What about the swarf in the shell factories?

Sir Worthington Evans: Whoever owns swarf has also to make a return.

Sir Ernest Moir: It is a difficult thing.

Sir Worthington Evans: It will be. You will have to read the return intelligently, because some of it will be more or less guess-work.

Mr. Llewellyn: That is a separate organisation. We have been dealing with copper swarf for months past.

Sir Worthington Evans: The Minister will get what he wants—a comprehensive return as of a date, and if that is read intelligently it will be all right. If you read it as gross totals without any deductions you might find it an overstatement of the actual available stock.

Sir Ernest Moir: Is this to be made monthly?

Sir Worthington Evans: Yes, and the end of the year is the first month. If that Order is approved, and I gather it will be approved, it will be in the Gazette to-morrow.

Mr. Ellis: Will it prevent people from making copper kettles?

Sir Worthington Evans: I am not sure what A. and B. work is, but I am sure it does not cover copper kettles, so I do not think the Order will.

Sir Ernest Moir: What about the copper equivalent in brass scrap? Is that dealt with?

Mr. Llewellyn: We had a long talk about this on Saturday, and a proposition is going to be put to you with regard to copper kettles and brass used in fenders, and things of that kind, the idea being

that Mr. Chamberlain is going to suggest that certain trades are not essential. That will automatically cut out some of those, but in the meantime with regard to brass which we are getting back now, we know we are getting a very large proportion, except in those particular trades. To give you an idea of the quantity of swarf which is coming back at present, practically a third, or over 1,000 tons per week of brass scrap and swarf is now being recovered and is going into munitions.

The Minister: We had a meeting on this in my room about a fortnight ago or thereabouts, and I remember that some of you gentlemen were appointed to draw up a scheme for recovering the whole of this brass scrap, ascertaining its amount, and so on. I think we had better defer this until they have put up their scheme. Now aluminium.

Mr. Llewellyn: With regard to aluminium, we have rationed it. We have sent out circular letters to each of the particular departments using aluminium, telling them we shall only be able to allow them so much.

Sir Frederick Black: They have not actually gone out.

Mr. Llewellyn: They have gone out of my department.

Sir Frederick Black: They are being printed. They have gone from you.

The Minister: These are the deficits for the first half of 1917. I will only give the thousands and not the odd tons. Brass, 28,000 tons; spelter, 11,000 tons; aluminium, 5,000 tons; lead, 70,000 tons; high speed steel 1½ thousand tons; wolfram and scheelite, 1,000; silica bricks, 775,000 units. What is a unit?

Mr. Edgar Jones: That would be the numbers.

The Minister: What is the limiting factor of these bricks—labour?

Mr. Llewellyn: I believe so, but Mr. Hunter is dealing with that.

Mr. Hunter: Yes, labour.

Mr. Duckham: Entirely labour.

The Minister: How is the scheme getting on for getting these reserve men transferred to silica brick works?

Mr. Kent: The silica brick position is that there is not a very big demand. I have not got the figures with me, but I think it is a few hundred.

Mr. Llewellyn: The point is that German prisoners have been put into ganister works, and they have relieved it.

Mr. Kent: The position with regard to ganister works and so on is very difficult, because the Home Office look upon that work as their pigeon and not the Ministry's. Ganister work is nearly always in conjunction with coal, and anybody who works below ground in coal mines, etc., is the Home Office's job and not the Ministry's. We did release a certain number of soldiers for working ganister, but as soon as it was done we were threatened with a general strike if the releases were not cancelled.

The Minister: Ganister is not the same as silica?

Mr. Kent: No.

Mr. Duckham: It is absolutely labour shortage.

The Minister: Is it the making up of the ganister into silica bricks, or is it in getting the ganister?

Mr. Hunter: I think it is both.

Mr. Kent: Yes, both.

The Minister: Have you any statement of what the shortage is on the ganister side of it?

Mr. Kent: I have, but I have not the figures with me. I can let you have them. With regard to the ganister works, and the iron ore mining, and so on, it is very difficult, because the Home Office say it is their work. I think it is a matter I shall have to bring before you.

The Minister: I think so too. Mr. Kellaway has made a note of it, because we cannot be held up like this. How about releasing men for silica brick works?

Mr. Kent: The names are all with the War Office, but the releases are very slow. I think all the men in the Home Forces have been released and the balance is overseas, and it is very difficult to get them out.

Mr. Edgar Jones: Mr. Hunter's department has done a lot lately to get labour-saving machinery in old works, and he is getting an increased output from the present works.

Mr. Hunter: We are doing all we can in that direction.

The Minister: Are these 775,000 bricks a big item?

Sir Worthington Evans: It is about 12 per cent.

The Minister: Now propellant supplies in the first half of 1917. How are shipments going on?

Sir Frederick Nathan: They are going on fairly well. Unfortunately we have had to put one boat which was very long overdue down as lost I am afraid. It contained about 150 tons of nitro-cellulose powder, and about 150 tons of acetone. The requirements of nitro-cellulose powder for Great Britain for the first six months of this year amount to 44,735 tons. Against that there is a gross total of 54,154 tons, or a net total, taking off 10 per cent., of 48,739 tons.

The Minister: You mean to say that is shipments and one thing and another?

Sir Frederick Nathan: That is what is due in this country during the first six months of the year. Taking the figure of 48,739 tons, it leaves a surplus of 4,014 tons, but on the other hand, 6,000 tons of the 48,739 are for the Allies. However, the Treasury have not given sanction for the allocation of that quantity to the Allies so that it would give us a surplus of 4,000 odd tons, but there would be a deficiency if the 6,000 tons go to the Allies of 2,146 tons on the total programme.

The Minister: How is that being made up—by Naval supplies?

Sir Frederick Nathan: That is the nitro-cellulose position.

The Chairman: I know. The Navy was going to give us something.

Sir Frederick Nathan: There is a surplus, if the Treasury decision holds, that the 6,000 odd tons allocated to the Allies is not to go to them.

The Minister: I think we should proceed on the assumption that it will be. How does the cordite help us out?

Sir Frederick Nathan: It helps us out in this way. The cordite requirements are 41,710, and the available supplies, after deducting 20 per cent., which is the usual figure based on experience, are 45,536 tons.

The Minister: Does that include Naval cordite?

Sir Frederick Nathan: That includes Naval cordite.

The Minister: The whole of the Naval output for the first six months of the year?

Sir Frederick Nathan: Yes. That gives a surplus of 3,886, so that the position a little more than balances. The Navy have not yet formally notified the arrangement, but I am told that they are going to agree to our receiving the output of all the Naval trade firms with the exception of Messrs. Curtis and Harvey.

The Minister: For the first six months of the year?

Sir Frederick Nathan: For the first six months of the year.

The Minister: You are getting it now, anyhow.

Sir Frederick Nathan: I have not seen the letter, but I do not think they have put any limitation on it.

The Minister: I thought they agreed to January and February.

Sir Frederick Nathan: We have 4,000 tons—that is already agreed, and we are getting it—but in addition to that, up to the end of June we should get another 5,600 tons from Naval capacity.

Mr. Layton: Does the 45,000 include the Navy?

Sir Frederick Nathan: The 45,000 include 5,636 which we estimate we shall get from Naval firms, with the exception of Curtis and Harvey, during the first six months of the year in addition to the 4,000 tons they have already allotted to us.

The Minister: I suppose our stocks of nitro-cellulose are about down to bone, are not they?

Sir Frederick Nathan: No, in the magazines and at the factories we have got round about a month or five weeks' supply.

The Minister: How much have you got, Colonel Milman?

Colonel Milman: I have not had time to look up the figures to-day, but I do not think we are very happy.

Mr. Price: The stocks have gone up.

Mr. Layton: They are better than they were in November.

The Minister: Are they better than they were when we had our horrid shock?

Colonel Milman: Yes.

The Minister: What about the proposed improvements. I remember that Mr. Quinan was quite hopeful about increasing the percentage of output from the existing works.

Sir Frederick Nathan: I have taken into account everything which we can expect to get.

The Minister: What sort of increase are you going to get by these new methods?

Sir Frederick Nathan: So far as we have gone, it looks as if we should get an increase of about 30 to 35 per cent. on the home output.

The Minister: Is all that 30 per cent. included?

Sir Frederick Nathan: So far as we can get it during the first six months. It will take time before the factories work up to their increased output. It means additional buildings, plant and so forth. So far as we can take it into account we have done so.

The Minister: The gist of your statement is, to put it in blunt English, that if we take nitro-cellulose powder from the Allies we should meet our programme, and if we take cordite from the Navy we meet our programme in cordite.

Sir Frederick Nathan: We more than meet our cordite programme; we get about 4,000 tons over.

The Minister: That is not much over six months.

Mr. Price: There is 20 per cent. margin on that.

The Minister: That is the most hopeful feature—you have deducted liberally.

Sir Frederick Nathan: Experience tells us it is necessary.

The Minister: I think, as a matter of fact, you are getting more than 80 per cent.

Sir Frederick Nathan: I think until last month we only got about 80 per cent., but the total for the year up to the end of November was about 85 per cent.

The Minister: Are you creating any special organisation to ginger up the people?

Sir Frederick Nathan: We are keeping a very close watch.

The Minister: Is there any special staff doing it?—I think there ought to be.

Sir Frederick Nathan: Yes. We have been disappointed with the Gretna output. Gretna hopes, with reservations to meet their maximum of 800 tons by June next.

The Minister: What is Gretna doing now?

Mr. Price: It turned out 600 tons this week, but that, of course, is above normal. At present they are doing over 500 a week now, and they returned 600 tons to Sir Frederick this week.

The Minister: What is the maximum.

Mr. Price: 800 tons is the maximum, which we are putting up now to 1,000 tons.

The Minister: That will not be until when?

Mr. Price: June next.

Sir Frederick Nathan: They hope to work up to 800 tons by June.

The Minister: I must say I do think we must bully the Treasury on nitro-cellulose powder, because we are really only meeting our requirements by taking it from the Allies.

Mr. Henriques: That includes the authorisation which you gave me this morning to ask for further provision.

The Minister: Did it include that too?

Mr. Henriques: Yes, 750 tons a month from Gretna.

Sir Frederick Nathan: That is to exercise an option.

The Minister: I know we have had the option.

Mr. Henriques: We have a renewal of the Treasury assent to that.

Mr. Price: The Allies will certainly expect you to give them those quantities.

The Minister: I am sure they will.

Colonel Milman: I am sure we shall not be able to spare anything for the Allies.

Mr. Layton: It was bought for the Allies.

Colonel Milman: For about eight weeks now I have not been able to fill more than, on an average, two-thirds of the cartridges.

The Minister: How many tons of propellant is required for 1,000 18 pdr. shell?

General Bingham: 1,500 lbs. as near as makes no matter. It is 1-6 lbs.

Colonel Milman: It is only about $\frac{1}{3}$ rd of a ton.

Sir Ernest Moir: There was a rumour that by adopting new process Gretna was going to increase its output largely.

The Minister: That is all included. Unfortunately the 30 per cent. increased output is included.

Sir Frederick Nathan: No, not in the case of Gretna. I have only taken the actual promises which we have received from Gretna.

General Bingham: When is your new nitro-cellulose factory coming into operation. Do you put it down as eight months?

Sir Frederick Nathan: Not till October.

The Minister: How are your stocks of nitro-cellulose powder. Have they gone up a bit?

Mr. Price: I think they have been going up, and I think Colonel Milman has been filling absolutely up to programme, if not a little more.

Colonel Milman: I repudiate the soft accusation.

The Minister: We may want Colonel Milman to go even beyond that. That is what is at the back of his mind.

Mr. Price: I do not know where you will get the nitro-cellulose from.

Mr. A. Duckham: Might I ask Sir Frederick to distinguish between rifle and gun cordite.

Sir Frederick Nathan: My figures are gun cordite: there are very adequate supplies of rifle cordite. We have over 1,000 tons in stock, which has been growing up gradually from the beginning of the year, and we have a large stock of nitro-cellulose powder too.

General Bingham: And you have 900 million rounds in this country.

The Minister: Now the high explosive fuse. I had a meeting with your officers this morning, Colonel Milman, on the filling of high explosive fuses. I take it that the reason it declined was because you had not the fuses to fill or did not like to take them out of stock.

Colonel Milman: About ten days ago I think the stock of empty fuses was 1,200,000. We cannot possibly fill at that rate with that stock.

The Minister: I see on 16th December it was 1,800,000 available for filling.

Colonel Milman: Yes, it has gone up a bit. My figures were either 2nd or 9th December.

The Minister: We had a special meeting with your officers, Sir Glynn West and others on this subject this morning, and it was adjourned until Wednesday, so that I do not think we need take up the time of to-day's meeting with it.

Shell steel supplies. I am very sorry to see that it is a minus quantity in most things. How is the labour position getting on?

Mr. Hunter: The labour position in steel works?

The Minister: Yes.

Mr. Hunter: May I speak generally to begin with. Owing to the Christmas holidays we have not had a return, and all I can tell you generally is that the average steel production for the last six weeks was, roughly, nearly 37,000 tons per week against Sir Glynn West's programme of in the neighbourhood of 32,000 tons per week.

The Minister: Home production?

Mr. Hunter: Yes, that is leaving French steel and Admiralty steel out of it. The output of steel for shell is now about 10,000 tons a week better than

it was at the end of July. That is a general statement.

Now our labour is very badly off. I do not think the labour which has been supplied to us from the Colours can be depended on—certainly not for quality. Neither can we get the numbers of men back which we were led to believe and hope for.

The Minister: You have got a good many more lately, have not you?

Mr. Stephenson Kent: Yes, but Mr. Hunter is putting forward the fact that the labour which has been supplied—Army Reserve Munition Workers—is of no great practical value in blast furnaces. I do not think I have had anything very much from Mr. Hunter as to the labour which has been supplied for steel works.

Mr. Hunter: The same thing applies.

Mr. Stephenson Kent: The only thing is that we have arranged with the War Office for tin-plate mill workers as a reserve for steel works, but I do not think we can draw on them very much because a great deal of that labour is engaged on important work to-day. Those men are to be called and passed for Army Reserve W.

The Minister: You have placed a good many lately, but they are not very good when you have got them.

Mr. Stephenson Kent: That must be so. These men are not fit for General Service; they are in B2 and 3, C2 and 3 classes, and they will not be very strong physically or very fit.

The Minister: Of course these people will have to learn to make good with second-rate material like everybody else has had to, but I am afraid that is no comfort to Mr. Hunter.

Mr. Hunter: The steelmakers are alive to that, and they are making the best use of the men offered to them, but we cannot blame the steelmakers if they cannot get these men to make steel, because they are from a very unfit class. What we have to recognise is that our production of steel will never increase unless we do get more labour than we are getting just now.

Mr. Kellaway: Is it more labour you want or labour of a different class?

Mr. Hunter: Both. I put up a minute to you a fortnight ago.

Mr. Kellaway: I asked you to let me have a statement of the requisitions you had made on the Labour Supply Department and the extent to which they had been met. I have not had that yet.

Mr. Hunter: I understood it had been sent; I will take that up.

Mr. Stephenson Kent: As a matter of fact, I think so far as numbers go, we shall satisfy the immediate demands of the blast furnaces, and I think we shall go a good way towards satisfying the demands of the steel works with regard to numbers, and I hope a bit more in regard to quality in the steel works.

Sir Ernest Moir: Would it not be a good thing to offer a bonus on the output? If the gross tonnage was increased the wages would go up.

The Minister: They get about £15 a week as it is now.

Mr. Stephenson Kent: They get colossal wages.

The Minister: They are on piece work, are not they?

Mr. Stephenson Kent: Yes.

Mr. Llewellyn: I think the more money you give them the less they do.

Sir Alexander Roger: I think you would probably increase the output if you decreased the pay.

Sir Ernest Moir: I mean a special bonus on output.

The Minister: We did discuss that. These fellows get bigger wages than almost any other people in the United Kingdom, do not they?

Mr. Stephenson Kent: Yes.

Sir Ernest Moir: If they can earn it, it shows they are worth it, if they get a special bonus for output.

Mr. Stephenson Kent: That is the system of payment in blast furnaces.

The Minister: Mr. Hunter, how do you stand with regard to the Navy. Does the Navy take any shell steel from you?

Mr. Hunter: Yes.

The Minister: How much?

Mr. Hunter: Between two and three thousand tons a week.

The Minister: It is not much. What proportion of the total steel output does shell steel form?

Sir Ernest Moir: The present output is 4,000,000 tons I think.

Mr. Hunter: I think it is nearly a half.

Mr. Layton: Between 40 and 50 per cent.

Sir Glynn West: You are speaking of home production, Mr. Hunter?

Mr. Hunter: Yes.

The Minister: Is there any other purpose for which steel is made? Is there any other steel which is sufficiently akin to shell steel that you could make encroachments upon it?

Mr. Hunter: I do not think so.

Mr. Kellaway: What is your present unsatisfied demand for labour?

Mr. Hunter: Do you mean for pig iron, blast furnaces, steel works and ore mines?

Mr. Kellaway: Yes, but give them under the different headings. You have put up requisitions for men for getting out the ore, for working in blast furnaces, etc. What is your demand which has not been satisfied?

Mr. Hunter: You mean the number?

Mr. Kellaway: Yes.

Mr. Hunter: I should think 5,000 or 6,000 men at the moment.

Mr. Kellaway: Does that cover all of it?

Mr. Hunter: I should think so.

Mr. Kellaway: I should think you would get them out of the tin-plate works.

Mr. Stephenson Kent: The demand on 16th December was 3,706; the greater bulk of that has been satisfied.

The Minister: I should like to ask Sir Glynn West whether he has anything to say on the question whether we could use other classes of steel?

Sir Glynn West: I think there must be a lot, if you give the steel up. We have to give up steel every day for other manufacture. Every ounce of steel which is made would do for shell steel if it was made in monobloc.

Sir Ernest Moir: The suggestion made the other day was that a large number of 60 pdr. Shrapnell shell might be returned and re-moulded.

The Minister: We have been on to that, Sir Ernest.

Sir Glynn West: Here is a question I have before me now. The question of steel supplies is very bad, and then there is the 6-inch Shrapnell. I have taken the matter up with the Steel Department and they inform me that one large source of supply, Messrs. Brown Bayley & Co., have produced nothing for four weeks, and they have now discovered that it is due to the Admiralty having commandeered the whole output, 200 tons a week, for aeroplane engines.

Mr. Hunter: That is not exactly the thing. It was two or three days more or less before we knew that Messrs. Brown Bayley were not going to fulfil their obligations in respect of that shell steel. They got official sanction from here, I should think about two months ago, to put up extensions to their works, and also to give the Air Department another class of alloy steel to the extent of 30 or 40 tons per week. They began making alteration to the works, which were sanctioned, but they did not tell us if it was going to affect the shell output at all. They never mentioned it. They led us to believe they were going to meet their obligations, but they have not done so. Mr. Jacks, who is dealing with aircraft steel, is in Sheffield to-day and we have wired to him to go into the question with Messrs. Brown Bayley. Another complaint from the same firm is that the breaking plant has broken down. Altogether our dealings with Messrs. Brown Bayley have been most unfortunate. It is not the fault of anybody in this building; it is the way in which they have

handled the business themselves. You can take it that arrangements will now be made so that the unpleasantness does not occur again.

Sir Glynn West: There are lots of sources of supply of steel which, if you cut them down, will make shell steel.

The Minister: What arrangements are there to collect the waste steel and melt it up again? Is there any organisation dealing solely with that, Mr. Hunter?

Mr. Hunter: Only in large quantities. The question of gathering up the steel in London has been raised from time to time. I do not know how we could get an organisation to deal with that; it would take a very long time to get it.

The Minister: What do you say to that, Mr. Fielding?

General Bingham: We have been considering it while Mr. Fielding was away.

The Minister: Of course I am a layman in these matters, but I cannot help thinking that there is a good deal of scrap metal which could be used.

General Bingham: We are putting up a scheme.

Sir Ernest Moir: It has come already: it is to have a Director of Scrap.

The Minister: It is the general scheme you mean?

Sir Ernest Moir: We want to have somebody who will go round and not only see that the scrap which comes from swarf is used but that all other scrap is used.

The Minister: I am inclined to use the Local Authorities.

Mr. Edgar Jones: I understand there is more steel scrap than you can use.

Mr. Hunter: In certain works, yes.

Sir Ernest Moir: We want to find a way to use all the scrap. There must be about half a million tons of shell steel scrap in different parts of the country and large amounts of swarf.

Mr. Edgar Jones: A lot of shell discard steel is being exported.

The Minister: Who is allowing it to be exported?

Mr. Edgar Jones: I understand there is no other use for it.

The Minister: Oh, no. What do you say to that, Mr. Maclellan?

Mr. Maclellan: I am not aware of that.

Mr. Edgar Jones: The instruction from your Department is that you have a surplus of shell discard steel in this country, and, therefore, we can allow the export of it.

The Minister: You may take it from me that we will not have any more shell steel discard exported. Do not give any more licences.

Mr. Edgar Jones: I will stop it at once, but those are the instructions I have.

Sir Ernest Moir: I think you will have to appoint the Scrap Director quickly.

Mr. Charles Ellis: I am sure every manufacturer uses as much scrap as he thinks he can safely, but certain firms have, no doubt, discovered that they can use a larger percentage of scrap in their furnaces than others. I think if you had somebody of intelligence at the head of such a Department as is suggested, you would get the best brains of the country together and find out what percentage of scrap the more important firms are using and how they manage to do it.

The Minister: Some weeks ago Mr. Hunter made the people in Scotland who were using, say, 15 per cent., use 30 per cent., or something of that sort. I may have got my geography wrong, but that is a detail.

Mr. Hunter: In reference to what Mr. Ellis said, I think I have a fair amount of intelligence. We have taken up the question with some of the steel-makers, and we have taken it up so severely that we threatened to close steel works because they would not use anything but pig iron in their furnaces. We have insisted upon that very strongly. Formerly they used somewhere about 10 to 15 per cent., and now they are up to 50 to 60 per cent. We have impressed this on all the steel makers we have come in contact with. We have had meetings here

and impressed on them that they must use scrap and use a proportion up to somewhere about 70 per cent. Some of the gun people, such as Armstrong, Whitworth & Co., are using shell borings from the works without any pig iron at all.

Sir Glynn West: They have a special process for that. We put it into a basic furnace and convert it, and then put it into acid, but it is very expensive.

Sir Ernest Moir: It is quite a job for somebody to organise.

The Minister: I should have thought you could have melted the lot up and made something of it. I know you have brought a lot of people up from 10 to 30 per cent., but I am glad to hear it is 60 per cent.

Mr. Hunter: In those particular instances it was 60 per cent.

Mr. Edgar Jones: It seems necessary to get somebody to go into the technical questions and make the makers use shell steel discard. Some firms say they cannot do anything, whereas other firms do do something.

The Minister: Anyway, we will not have it exported.

Now Iron Ore Supplies. Do you know how shipments are going on?

Mr. Hunter: It is a little bit out of my Department, but the position to-day is a little bit worse than it was. It is almost impossible to get ships to carry it.

The Minister: Is the neutral tonnage going out of the trade?

Sir Ernest Moir: Mr. Burton Chadwick is trying to make arrangements to insure neutral tonnage. A good many ships are being forced to go back to port under the threat of being sunk by submarines. We had no intimation that you wanted to go into this question, or we should have had somebody from Mr. Burton Chadwick's Department here. I know he is very disturbed about the shipping situation. I should think he is not getting two-thirds of the ore from Spain which he should be getting.

Mr. Phillips: I can give you some up-to-date figures on that. At the present moment we are 160,000 tons in arrear on Mediterranean-Spanish ore coming into this country.

The Minister: Is that weekly?

Mr. Phillips: No, total arrears—what we ought to have received up to now. That is mainly because it comes in Italian ships, and we had a programme from the C.I.R. as to what its ships would bring, but that programme is utterly unreliable. It is nothing to do with submarines at all. Some of the boats have been 35, 42, 49 and even 73 days late in sailing. You cannot work on a programme like that.

Sir Ernest Moir: What proportion of the iron ore we ought to get from Spain is in now?

Mr. Phillips: It is going up, but I could tell you exactly what it is.

The Minister: It is 600,000 tons a month, is it not?

Sir Worthington Evans: 175,000 tons a week, I am told.

Mr. Hunter: The maximum is 175,000 tons a week.

The Minister: That is 700,000 tons a month. The average weekly tonnage for the month of December is 99,940 tons.

Sir Worthington Evans: I find in the Secret Report that for the seven weeks up to 16th December the tonnage chartered was an average of 111,964 tons, so that it has gone back.

The Minister: How about the development of iron ore at home. Sir Worthington Evans, you have been going into that.

Sir Worthington Evans: Before you leave the insurance question, there is no doubt that it did operate with the Norwegians three or four weeks ago. A scheme was got together for re-insuring the Norwegian Insurance Offices, because the offices were refusing to insure Scandinavian ships as it was not

a paying proposition. The scheme which was put on foot with regard to Norway was not in connection with Munitions but another Department. It seems to me you want something of that sort with regard to Spain.

The Minister: I think we ought to put through some scheme of insurance. It is very necessary to get the ore over.

Sir Worthington Evans: I have not the least doubt the neutrals are afraid and will not go into the trade, and as time goes on it is likely to get worse.

The Minister: You might take it up and see that this is gone on with, Sir Worthington.

Mr. Hunter: Spanish ships carrying iron ore have gone out of the trade.

Sir Worthington Evans: Do you attribute that to the fear of submarines.

Mr. Hunter: Entirely.

Sir Worthington Evans: The only possible way is to cover their risk.

Mr. Hunter: Some months ago when submarine activities began I put up a suggestion that in order to keep these ships in the trade, the Home Government should guarantee the crew, say, £100, if a Spanish ship was lost by torpedoing. That was lumped up for three or four weeks. I pressed it, and then I was told it was too big a question to go into.

The Minister: We will go into it.

Mr. Hunter: The result is that all the ordinary Spanish ships have gone out of the trade.

The Minister: I would rather you went into this.

Sir Worthington Evans: Let us go right at it. We want the cargoes here.

The Minister: Do you think it is necessary to have a scheme of insurance, Mr. Duckham?

Mr. A. McD. Duckham: Yes.

The Minister: How about the development of iron ore in this country. There are various schemes for increasing our home output: how are they going on?

Mr. Hunter: With regard to increasing the production in the Cumberland and Lancashire districts, if the necessary labour can be obtained it is estimated that an increased output of over 400,000 tons per annum of haematite ore can be obtained in the near future—say in six months.

The Minister: What sort of labour is required?

Mr. Stephenson Kent: The release of iron ore miners.

Mr. Hunter: We want to get German prisoners for this. I have taken the liberty of ordering half a dozen ironstone steam shovels, and we propose to give these machines to whoever is ready to work them.

Mr. Stephenson Kent: I understand that all the German prisoners in this country are allocated to agriculture, because nearly all of them are non-commissioned officers, and there is an understanding that non-commissioned officers shall not be used except on the land, or something to that effect. Secondly, I understand the Cleveland Iron Ore miners are working short time at the present moment.

The Minister: Why?

Mr. Kent: I should like to know.

The Minister: Can you throw any light on that Mr. Hunter?

Mr. Hunter: I cannot.

Mr. Kent: We have had very serious complaints from the district. The men want to leave and go to coal-mining, where they would earn better wages.

Mr. Hunter: I heard they would not work more than 8 hours.

Mr. Wolfe: I can explain that I think. We have been having a great deal of trouble in attempting to persuade the Cumberland Iron Ore miners to work two extra shifts per week. Ultimately the arrangement was that they were to go on the 3 shift system if the labour could be found. Mr. Hunter's figures, I suppose, are based on the assumption that

they will work on a 3 shift system. The owners told us they were going to put the 3 shift system into force. I rather fear that the miners are not expecting to put the 3 shift system into force at all, but are waiting to make some bargain about the make-up.

The Minister: That throws no light on Mr. Kent's statement that the men are working short time.

Mr. Llewellyn: The mining in Northumberland and Cumberland districts is underground, but in Lincolnshire it is surface mining. It means taking away the subsoil and then you have the lode of the mine under that. That part of the work could be done very well by German prisoners, but you would never get the German prisoners to work up in Cumberland.

Mr. Kent: No.

The Minister: All the Cumberland mines are underground, and there you say they are working short time.

Mr. Kent: So I understand. I will have the papers sent up.

Sir Glynn West: Is it not possible that they have started the 3 shift system and they call that working short time?

Mr. Kent: No. They are getting very poor pay as compared with the coal miners.

The Minister: I see the deliveries of copper bands are getting very short. Some of the works have been greatly held up by non-delivery.

Mr. Llewellyn: We are tremendously in arrears with our shipments. I do not know whether she is lost or not, but there is one ship with 1,000 tons due nearly a week ago.

Mr. Phillips: She is lost I am afraid.

The Minister: Is that the one the raider stopped?

Mr. Phillips: Yes.

The Minister: She sunk three munitions ships, did she not?

Mr. Phillips: Yes.

Sir Worthington Evans: Have they caught her?

Mr. Phillips: No.

The Minister: That only increases the urgency of going on with the Copper Order.

Now 6 inch shrapnel, Sir Glynn West. I see the deliveries of empty shell are only about half the requirements?

Sir Glynn West: Yes. We are committed to one firm for 5,000 a week. The original demand was 2,500, but the firm have never got further than 2,500. I got through to them on the telephone on Saturday about it, and they said they hoped to get up to the full 5,000 within a fortnight from now. They ought to have done much better.

The Minister: Who are they?

Sir Glynn West: Harper, Son & Bean.

The Minister: They are pretty good people, are not they?

Sir Glynn West: Yes, but they had great difficulty with the steel. We are short of steel.

The Minister: I see, Mr. Ross Skinner, that the stock of uninspected shell on 16th December was over 16,000, and there have been less than 500 accepted during the last fortnight.

Mr. Ross Skinner: The stock on our hands is 5,000, but inspection has been delayed owing to lack of gauges. The stock manufactured at Harper, Sons & Bean has been consigned to Woolwich for inspection, and examination commenced on 16th December. About 12,750 shell have been despatched to Woolwich, and to-day 4,000 of those have been inspected. There are 4,000 out of the 12,000 since received. I think all we have on our hands will be put through at a very early date.

The Minister: I see the manufacturers were choked up with shell, but it was a question of gauges. Have you got them now?

Mr. Ross Skinner: Yes. Now there are two sets, and they will be pushed through.

The Minister: I see the supply of copper for quick firing cartridge strip has also dropped. Birtley Cartridge Case Factory will probably be brought to a complete standstill. What do you say to that Sir Glynn?

Sir Glynn West: It is lack of copper. They make their own strip. I had four or five telegrams saying they were coming to a standstill if they did not get more copper.

Mr. Llewelyn: They have not actually stopped.

Sir Glynn West: No, you got some copper down to them. We borrowed copper from different places round about, and made the best we could of the different stocks. There has been no absolute stoppage.

Mr. Duckham: We have had a stoppage in making strip, due entirely to shortage of copper.

Sir Glynn West: If you got the copper for Birtley, probably you would be short of copper somewhere else.

The Minister: Is it not a question of shipment at the moment? We have covered ourselves in copper, have not we?

Mr. Llewelyn: I think we have 9 to 10,000 tons awaiting shipment now, and the Russians have about 9,000 tons, and the French about 31,000 tons. The French are absolutely starved for copper. We cannot get it across. One of our Australian boats has gone down too.

Mr. Duckham: Is there any chance of conveying important stuff like that?

The Minister: The Admiralty seem to say that the system of conveying across the Atlantic is not a very practical way of doing it.

Mr. Hanson: I thought the French copper was not waiting because there were not any ships but that the French could not get any ships.

Mr. Llewelyn: It was want of shipping.

Mr. Hanson: I thought we were negotiating with the French an arrangement that if they would hand it over to us we would ship it.

Sir Glynn West: A man came to me and offered 2,000,000 blanks for 18-pounds provided we supplied the copper over in America from the stock we had there.

Mr. Duckham: You have no more chance of getting your blanks shipped than your copper shipped.

Sir Glynn West: We should get the shell over.

Mr. Llewelyn: We have any amount of copper on order and any amount awaiting shipment, but we cannot get it.

Sir Ernest Moir: What about insurance?

Mr. Hanson: We take the risk. There is a shortage of railroad cars in the United States, but Sir Ernest Moir's organisation telegraphed to say that the Christmas holidays had greatly interfered with shipping generally, and that interference would continue for about ten days to come, after which they expect to get going again.

Mr. Llewelyn: We sent Mr. McConnell out over a month ago to try and get shipments boosted up. Apart from copper, we are about 9,000 tons of brass rod in arrear.

Mr. Phillips: It would make all these things easier for the Admiralty if I were informed a little earlier if shipping is wanted. They are suddenly called upon to provide tonnage for 30,000 tons of steel, and now they are asked to provide shipping for 45,000 tons of steel rail from Canada. It is rather unreasonable to expect them to provide it when called upon quite suddenly. I think there should be some machinery to advise it.

The Minister: I thought our Overseas Transport Department had cognisance of all these things.

Mr. Phillips: They were not told about this until right up to time: they were not told about the spelter till right up to time.

The Minister: Does every Department send to you their requirements for shipping some months in advance?

Mr. Phillips: No.

Mr. Brand: As regards Canada, it is arranged direct between Mr. Harris, the Admiralty's representative in Canada, and the Admiralty. He informs them what the Munitions Board intends to ship and they provide the transport. These rails, as you know, came on them suddenly, but they are now looking into the matter over there. I think

the most convenient and best way to arrange it is to let the Munitions Board inform the Admiralty's representative out there.

The Minister: What do you say to that?

Mr. Llewelyn: Might I suggest that you sent in for some sort of priority order for shipments? We cannot very well tell them when we have got the copper there it is the other side who know about it. We can only tell them when it has accumulated. Take the case now of calomines, which is in competition with iron ore. It is only about 4,000 tons a month, but we have two furnaces in South Wales which have been put out because we cannot get them. I think there should be some sort of priority committee which would say which is the most valuable commodity to be brought forward because it is going to be a very serious matter if we are going to be stopped for copper. With all the good intentions in the world, we cannot help it as it is now.

Mr. Price: You will remember that you authorised us to buy sulphur at short notice. If we had waited to get the Admiralty's consent, I think we should still have been waiting to get sulphur.

The Minister: Three-inch gun cartridge cases. I understand that numbers of these are splitting. I do not know whether you can throw any light on this, General Bingham?

General Bingham: I have not heard of this particular case.

The Minister: They are three-inch 20-cwt. anti-aircraft guns.

General Bingham: I cannot tell you anything about them.

The Minister: Perhaps you might look into that.

Register of plant. The increasing difficulty in obtaining permanent way track, locomotives, and steam cranes, new or second-hand, has been seriously felt. During the past week one suitable locomotive and one travelling crane have been commandeered under the Defence of the Realm Act, but this piecemeal procedure is not conducive to satisfactory results. Strong representations have been made in favour of action by the Ministry on the lines taken in connection with hay and wool supplies, namely, by enforcing a return by owners of all such materials, and a veto on dealings in such materials, without the consent of the Ministry. You have already done that in regard to locomotives.

Mr. Edgar Jones: That is in operation for cranes now; the Machine Tool Department did that long ago. They control every crane that is made and its destination. They control second-hand cranes, too.

The Minister: We do that with railway materials, too.

Mr. Edgar Jones: Yes.

Mr. Llewelyn: There is a line in South Wales which was only put down 10 years ago, which has practically no traffic whatever. The whole of that line could be picked up.

The Minister: I think they are going to pick it up.

Mr. Llewelyn: There is the whole of the rolling stock as well.

The Minister: The Railway Executive have undertaken to pull up 200 miles of line and ship it. They are also providing 20,000 railway trucks. As a matter of fact, we requisitioned 30,000 railway trucks, 10,000 of them from private truck owners, and a large number of locomotives. We made an arrangement whereby the railway companies will have a complete list of all their orders for making any of these things and they cannot place orders without our consent. I think we are getting that tightened up.

Mr. Edgar Jones: I think the time has come to absolutely control railway materials in the same way that cranes are controlled. General railway material is not controlled now under any definite Order; it is only controlled with regard to supplies. Big firms like, for instance, Hadfields can go on casting wheels without any system of control. I think it would be a good thing to get out a scheme of control in connection with the whole of railway supplies under Sir Ernest Moir's Department.

The Minister: What do the steel people say to that?

Mr. Maclellan: Do you mean the disposal of wagons and locomotives?

The Minister: Yes, the making of them.

Mr. Edgar Jones: The making of wheels and things of that sort.

Mr. Maclellan: For the supply of the railways of this country?

Mr. Edgar Jones: Control all railway material generally. We shall have to let India have some to keep them going.

The Minister: I think this is a detail which might be discussed with the experts before we take it up with the whole meeting.

Sir Glynn West has one or two points to raise with *Mr. Ross Skinner*.

Sir Glynn West: I was asking *Mr. Ross Skinner* about the difference between the two columns in the detailed Weekly Report. One column says, Stock in the hands of Inspection Department, and then there is another column which shows the stock in bond. When the shell are in bond I have nothing more to do with them. I notice that in a great number of cases there is a very big difference—sometimes there are 10 times more shell in hand. I should like to know what the difference between the two columns is.

Mr. Ross Skinner: In very many cases the difference is that there is home and foreign stock, and the two are added together in the one column.

Sir Glynn West: When a thing is in bond I have nothing more to do with it.

Mr. Ross Skinner: I think you took as an instance the 6-inch shell, of which there are about 350,000 in stock; 178,000 is home stock which has to be inspected, and the balance of 158,000 is foreign stock.

Sir Glynn West: I cannot do anything more with them.

Mr. Ross Skinner: They are there to be put forward when somebody calls for them.

Sir Glynn West: But when they are in bond I have nothing to do with them.

Mr. Ross Skinner: They must appear somewhere; they must be taken over.

Sir Glynn West: You do not mean they are not available?

Mr. Ross Skinner: No, they are available.

Sir Glynn West: That is all right, so long as the second column shows they are available.

Mr. Layton: Is the smaller column home shell only?

Mr. Ross Skinner: Yes.

Mr. Layton: Should that not be stated?

Mr. Ross Skinner: It is all uninspected, home and foreign.

Sir Glynn West: I do not know what I have to do with the big column. Can I do anything for you?

Mr. Ross Skinner: I think you can.

The Minister: I think this seems to be a domestic question which we will not go into at this meeting.

EXHIBIT M.

TRANSFER OF RESPONSIBILITY FOR DESIGN.

Memorandum on the Transfer of the Ordnance Board and Inventions Branch from the War Office to the Ministry of Munitions.

(1) Experience at the Ministry of Munitions has shown that the expeditious and efficient supply of munitions requires the transfer of the functions of the Ordnance Board and the War Office with respect to design, specification, provision of samples, testing and so forth to the Ministry of Munitions, with a somewhat clearer definition of the functions of the two departments being obtained. Serious delays have already occurred in the supply of essential munitions owing to the divorce between design and manufacture. The Munitions of War Act contemplated such a transfer as is suggested.

The arrangements should, I think, be based on this understanding. The War Department should deter-

mine what forces it should employ and with what munitions and to what extent they should be equipped, and the Ministry of Munitions should be so staffed and organised that it can deliver to the War Department in a fit and tested condition and ready for service the munitions asked for.

Every day that passes, questions, small or large, arise in connection with the production of munitions which require reference to the Ordnance Board; in great part they are questions arising out of difficulties of manufacture demanding adjustment in alteration of design in some form or other, such as the type of a detonator, modification of a fuse, gun carriage and so on. Sometimes they are suggestions for improvement which occur in the course of manufacture. The settlement of these things should be under the same authority as that which is responsible for the manufacture and supply of the goods concerned, this expert branch (being in daily working touch with the different departments of the Ministry of Munitions and the Ordnance Department) should be augmented by the addition of expert representatives responsible for bringing up and obtaining determination, as quickly as possible, of the many questions which arise from the different supply branches. The setting out of design, the drawing up or altering of specifications, the provision of patterns and the final testing of the completed articles are essentially processes belonging to manufacture and supply. To have the first processes of supply outside the department responsible for supply is bound to lead, with the best will in the world, to delays and difficulties.

An important point also arises out of the fact that the Ordnance Board necessarily has its own programme and procedure, which it, of course, arranges for its own convenience and apart from the daily needs of the Ministry of Munitions. If the manufacturing problems with which the Ministry finds itself confronted daily are to be promptly dealt with it is evident that the work of the body dealing with them should be arranged in accordance with the nature and quantity of the questions arising. The divorce between the working of the two departments does and must lead to delay in the settlement in appropriate order of the matters demanding determination in the interests of expeditious manufacture.

Illustrations in support of this point can be offered if desired. The slow progress in deciding upon the adoption of the French fuse is a case in point. This fuse requires only about one-eighth of the brass needed for the British fuse with a corresponding saving in cost and amount of material, besides which it is more economical of labour and filling material. Our own fuse and gaine rest under grave suspicion of being dangerous to guns and gunners, and the point raised by the bursting of our guns eight weeks ago has not yet been settled. The French fuse, on the other hand, has proved during recent operations that it can be depended upon.

The Ministry has kept in close touch with the War Office in regard to all matters of alterations of design, etc., and fully recognises that there are points of military use, etc., which the War Office must decide, but we cannot fail to recognise that numbers of questions have arisen either out of manufacturing difficulties or military experience which could have been settled more expeditiously under more adequate machinery.

Questions relating to guns and gun carriages, fuses, detonators, gaine, design of shell, use of particular mixtures of explosives, could be settled under a revised procedure much more expeditiously than at present.

The experiments to determine the cause of gun bursts have been, no doubt, of a very difficult nature, but they have involved throughout, very largely, questions of manufacture and material. The Ordnance Factory has, no doubt, advised on the manufacturing points, but the Ministry throughout has not been represented directly in these matters. The experiments have been in hand for two months, but the Ministry has not yet been definitely informed

of the final results, and supplies are being delayed until questions of type of fuse or gain are definitely settled.

We have had much difficulty also and some change of opinion as to details of the specification of steel for shell.

I suggest that the work of the Ordnance Board and the Inventions Department of the War Office should be incorporated with the Ministry of Munitions and that such an Ordnance Department should be strengthened both in staff and equipment to cope with the enormous amount of work which has fallen to it. The organisation should be of such a character that the War Office can rely, without question, upon its decisions. With this transfer should pass the Research Department and the proof butts and ranges which are required for testing and experimental purposes.

Further Notes relating to the Ordnance Board, the Inventions Department, the Woolwich Departments, etc.

My experience since the formation of this Ministry has shown clearly to me that unless the present line of demarcation between the functions of the War Office and the Ministry of Munitions is further adjusted on the lines indicated below, there will be serious delays in the delivery of essential munitions to the Army. Such delays have already occurred during the past three or four months owing to the division between design and manufacture.

It is essential that the War Office in the matter of artillery and munitions of war shall concentrate its energies, and have time to devote to further thought upon such matter of high importance as:—

(1) The best distribution and use of munitions in the Field:

(2) The training, organisation, and distribution of personnel. The War Office must, of course, maintain its responsibility for the general nature of the weapons and equipments required, and for concurring in such alterations as might affect their use in the Field or the training of the personnel.

The setting out of design, the drawing or altering of specification, the provision of patterns and final testing of the completed articles are essentially processes belonging to manufacture and supply, and the Ministry of Munitions should be wholly responsible for them here, as the French Minister of Munitions is in France, and should be so staffed and organised that it can deliver to the War Department in a fit and tested condition and ready for service the munitions asked for.

The Ministry of Munitions in meeting these requirements should be able to control and co-ordinate all the activities and operations that bear on manufacture and on the speeding-up of supply; and in making such alterations or adjustments as manufacturing exigencies may require from time to time, it should be able to decide these matters for itself and not require to apply in respect of them to another department of the State.

In pursuance of this general policy the Ordnance Board, the War Office Inventions Department, the Research and Chemical Departments at Woolwich, the proof butts and ranges, etc., should be regarded as under the supervision of the Ministry of Munitions.

The Ordnance Board should be reconstituted. The War Office, Admiralty, and Ministry of Munitions should be fully represented on that Board. The combined Inventions Board should have its representatives on the Ordnance Board. The minutes of proceedings of the Board should be available for the three departments, and should distinguish as clearly as possible between points of manufacturing detail, on which the Ministry could act, and those of a military or naval nature requiring the approval of the War Office or the Admiralty.

The War Office should also have access to ranges, butts, research department, etc., as may be necessary

for artillery training or other services not transferred to the Ministry of Munitions.

Such adjustment of storage should also be made at Woolwich between the Army Ordnance Department and the Ministry of Munitions as will enable the latter to receive, store, and handle all components of gun ammunition up to the point of handing over complete inspected ammunition to the Military Authorities.

These arrangements should take effect from this date, the necessary details being arranged in personal conference between the departments concerned.

EXHIBIT N.

Note on the powers and functions of the Air Board and on the supply of aircraft.

1. The Board will be composed of
The President,
The Parliamentary Secretary,
The Fifth Sea Lord of the Admiralty,
The Director-General of Military Aeronautics,
Two Representatives of the Ministry of Munitions,
Additional Members, as may from time to time be found desirable.

The Naval and Military Representatives shall each be authorised to bring to meetings of the Board an Assistant if and when they think fit. In case of the absence of the Fifth Sea Lord or the Director General of Military Aeronautics, an Officer will be deputed to represent the Admiralty or War Office.

2. The Board shall be free to discuss matters of policy in relation to the air and to make recommendations to the Admiralty and War Office thereon.

3. The Admiralty and War Office will concert their respective aerial policies in consultation with the Air Board.

4. The Admiralty and War Office will formulate the programmes of aerial production required for the fulfilment of the approved policy and will refer these programmes for the consideration and concurrence of the Air Board.

5. The Air Board will decide as to the extent to which it is possible to approve the Departmental programmes, having regard to the possible rate of production, the needs of the other Department, the respective urgency of the demands and the supplies agreed to be given to Allied Governments.

6. The Air Board will select and be responsible for the designs of aeroplanes and seaplanes, with their engines and accessories, which are to be constructed for the purposes of the approved programme and for experimental purposes.

7. For the purpose of carrying out its duties in connection with design, a Technical Committee will be constituted under the Air Board as follows:—

Chairman, to be appointed by the President of the Air Board.

Two representatives appointed by the Admiralty.
Two representatives appointed by the War Office.
Two representatives appointed by the Ministry of Munitions.

Three other members possessed of special qualifications may be appointed by the President; at least one of them shall have present day manufacturing experience.

The officers selected to represent the above Departments of the Government may be assisted or replaced by other representatives as may be found convenient.

The representatives of either of the three Departments may appeal to the Air Board in the event of their disagreeing with a decision of the majority of the Committee.

8. One of the Members of the Technical Committee will be the Executive Director of the Technical Department of the Air Board.

9. An Inventions Committee will be appointed by the President of the Air Board, in which will be amalgamated the functions of the Aeronautical Sections of the Naval Board of Invention and Research and of the Munitions Inventions Department.

10. Experiments for the Naval and Military Air Services will be conducted for those Services through the Technical Committee. For this purpose, Naval and Military Air Service Experimental Stations will, while remaining under the Admiralty and War Office for administration, pay and discipline, be placed at the disposal of the Technical Committee, which will issue its instructions through the Service Members of the Air Board.

The Experimental Stations in question are the following (to be agreed upon from time to time).

11. The Royal Aircraft Factory will be placed under the Ministry of Munitions and the designs prepared at the Factory will be dealt with in the same way as those submitted by a Contractor. It is understood that the Ministry of Munitions will permit the facilities of the Factory to be utilised largely for the purpose of conducting the experiments which are desired by the Technical Committee.

12. The Air Board will furnish approved plans and specifications to the Aircraft Supply Department of the Ministry of Munitions.

13. No modifications of design, other than trivial alterations within the discretion of a Superintending Inspector, will be made without the concurrence of the Air Board.

14. The numbers and designs of the aeroplanes, seaplanes, engines and accessories respectively to be ordered, having been determined by the Air Board, will be notified to the *Director of Munitions Requirements and Statistics* through the Controller of Aeronautical Supplies of the Ministry of Munitions, who will be responsible for their production, in conformity with the approved designs, and who alone is authorised to give instructions to manufacturers.

15. Inspection during manufacture will be carried out by the Ministry of Munitions.

16. All reasonable facilities will be afforded to expert officers of the Air Board and of the Services to have access to manufacturers' works.

17. The Ministry of Munitions will hand over to the Air Service for which they are destined, for trial and acceptance, the aeroplanes, seaplanes, engines and accessories, when manufactured, at the manufacturers' works.

18. For the purpose of giving effect to the above organisation, the officers and staff at present engaged under the Admiralty and the War Office on the duties of design and supply of aeroplanes, seaplanes, engines and accessories and on the Board of Invention and Research will, so far as may be required and possible, be lent for service with the Air Board or the Ministry of Munitions.

19. Any of the Departments represented on the Air Board, and the Air Board itself, will have the right of appeal to the War Cabinet in case of dispute.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE
TAKEN BEFORE THE
ROYAL COMMISSION ON THE PRIVATE
MANUFACTURE OF AND TRADING IN ARMS

SEVENTH DAY

Wednesday, 17th July, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Professor Gutteridge: With your permission, Sir, I should like to make a statement to the following effect. I have recently become the sole executor and trustee of an estate which comprises a certain number of shares in Messrs. Vickers, Ltd. and Sir W. G. Armstrong Whitworth & Co., Ltd. In case my name

should appear on the register of shareholders of those companies, I wish to make it perfectly clear that I am not, and shall not be personally interested in those shares, and that they will be transferred at the earliest possible moment to a beneficiary under the trust.

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C., appeared on behalf of the Union of Democratic Control.

1039. *Chairman:* Sir William, we have a copy of your clients' printed case,* and from what passed between us last night I understand what you propose to do is to put that printed case in as read. Since last night the case has been slightly revised, and I have no objection at all to the case as revised being submitted as evidence.

Sir William Jowitt: Thank you, Sir John. What I am proposing to do is to put that case in, and in the course of the few observations I am going to make about it to call attention to certain passages in it, and make any comments which I think proper upon it, so that those matters are clearly before you, and the eye and the ear can follow together certain passages.

1040. *Chairman:* Then you wish to address us and afterwards to examine your witnesses?

Sir William Jowitt: That is so, Sir John.

1041. *Chairman:* We have no objection to that.

Sir William Jowitt: I am much obliged. I might explain at the very outset, so that there may be no doubt about it, that the body for whom I have the honour to appear are quite frankly a Socialist body, believing in the Socialist theory. They are therefore perfectly ready and predisposed to take the view that a government concern is desirable on that ground alone. I mention that, and I do not want to conceal that at all, because, of course, you will discount, so far as you think necessary, the conclusions that we have come to in the light of that theory. Of course, you are in no way concerned with that theory, and you might think that we have too readily come to a conclusion by reason of our predisposition. On the other hand, we have tried, in making out this case, to divorce our minds altogether from the general theory and to consider this particular matter of the arms traffic on its own merits and quite separately and independently from the general theory which we support.

I mention that because I do not want to conceal the position of the Union in any way. They are a Socialist body, but they have considered this matter apart from the general, ordinary thesis.

The next thing I want to put to you is a word in justification of my appearance here, and it is this. It is quite obvious to any of you who have read, as

I have no doubt you have read, our evidence, that it has been prepared by a person or persons who know a great deal about it, and have a very extensive knowledge of the subject which you are considering. They have thought right to set out before you and endeavour to convey to you the facts which they have gathered about this particular trade.

Now, Sir John, generally speaking, for obvious reasons I am not in a position to call the persons who have been responsible for putting our case together. The facts which are stated in the case, I think, are largely beyond the realm of controversy, and an inspection of the armament works would reveal most of the facts which are set out. As far as the financial parts of our case are concerned, an inspection at Somerset House would confirm them. But I shall be able to call before you witnesses who have studied this matter carefully and will be able, I hope, to answer questions which may occur to you. May I add that if there are any questions of a technical nature which you would wish to ask, and you will let me know of them, I shall be very happy to get somebody to deal with them.

Now, Sir John, the next thing I want to say is this. We have not put this case before you at all from the point of view of pacifism. We shall have something to say about the desirability of suppressing this traffic, but we have addressed our minds to this problem quite frankly in this form. We concede that the state has inevitably to be armed as things are to-day, and for the purposes of to-day's discussion we concede that it is legitimate for you to consider whether the steps which are proposed will lead to satisfactory and efficient results. We shall endeavour to show you by evidence that the existing system, so far as armour and heavy ordnance is concerned, is an ill-devised system, combining the very worst features of private enterprise and collectivism, that it results in the state having to pay far higher prices than are necessary for the armaments which it buys, and that it does not provide adequate room for expansion.

Before I go any further in these observations, I want to say just this word or two about the question of desirability because, of course, you have to consider the desirability as well as the practicability of putting an end to the export trade in arms. I

* Appendix pp. 166 to 214.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

have not got the figures before me as fully and completely as I should like, but in order that you may observe, throughout, in what direction I am working, and in order to have a sense of proportion and perspective, I think it is desirable to have at the outset the sort of figure which we are dealing with. I quote from an answer in the House of Commons on the 30th May of this year. In reply to a Question by Mr. Lunn, Colonel Colville published a statement showing the quantity and declared value of arms and ammunition, and military and naval stores, registered as exported from the United Kingdom to foreign countries during the year 1934. The total exports came to £1,285,000. That, I understand, does not include aircraft, and does not include ships. I think they come under different categories in the official statistics. But it would seem very broadly to include all those matters which would be the subject of a licence, and the total therefore is in round figures £1,285,000.

I mention that figure because some people seem to think that any restriction in the export trade in arms would spell a shattering disaster to the industry in this country. I have not got, and I do not know whether it will be possible for you to get, the figures of home production, the amount which we spend at home in arms and munitions; but it is quite obvious that the figure, whatever it may be, is a figure which is vastly greater than the figure which is specified in this Answer, which is £1,285,000.

The next thing to be said in regard to this aspect of our work is as follows. It must not be forgotten that we are presenting the case to you, and inevitably so, without having had the advantage of any sort of disclosure of books or documents or accounts, or without having heard what the arms trade, or the witnesses on behalf of the arms trade, are able to specify. We are therefore in an entirely different position from those who are conducting this inquiry now, and in our evidence we are finding ourselves up against this difficulty, of not ourselves being able to obtain the evidence. We have therefore quite roundly and boldly suggested that you should take some steps comparable with those which are being taken in America in order to be certain that you get to the bottom of this matter, and in order to get the evidence of the witnesses which we have not been able to get. You will not think I am making this suggestion with regard to this evidence in any manner which involves any disrespect to the function of this Commission; far from it. We are satisfied, and we think you will be satisfied, that if the public conscience is to be set at rest in this matter, it can only be if the public feel that the investigation which your Commission are making is as full and complete as possible. We cannot ourselves get the evidence, and we have therefore suggested many points in which we hope you will think it proper to send for witnesses, for documents, for agreements, and so on; and with regard to some of those matters, I will say something in a few moments' time.

Now, Sir John, I should like to say a word or two on the question of desirability. Well, now, in the old Victorian days one used to hear it said sometimes, "If the Chinese insist upon having opium, at least let us see that the opium is carried in British bottoms." I think we have progressed a little from that point of view. We are asking you to say that this arms trade, this export of arms, small though it may be in amount, is doing, at the present time, incalculable harm in rousing international distrust and international unrest, that the trade is an undesirable and discreditable trade, conducted only too frequently by discreditable methods. It would be one thing, and quite possibly a proper thing, if arms were manufactured in this country, for a nation that does not manufacture arms to come to this country and ask, and ask publicly, for arms to be supplied to it. Such a thing is, of course, possible, and we trust that as a result of this Commission we shall do away with the touting which goes on at the present time,

involving, as it must do, heavy overhead expenses, and, involving, only too frequently, as we see it, and as we believe, discreditable methods which cause many difficulties in our private and foreign affairs.

We contend that the arms trade must have, on a *a priori* grounds, these tendencies. There must first of all be a tendency towards militarism. The profit-making motive, a perfectly legitimate motive in ordinary commercial dealings, must tend to make a man press his wares, and on our evidence we are satisfied as to that. I would call your attention to this. It is towards the end of Part II of our statement of evidence, and I will, with your permission, read these passages:

"If a manufacturer wishes to extend the sale of his wares, both in this country and abroad, he advertises, tries to supply a better or cheaper article than his rivals, and generally tries to persuade possible consumers that they will get more value in use from their purchases than the money they will expend on them. The amount of the sales which he can effect in this way depends partly upon the wealth of such consumers, partly upon his success in creating the opinion that it is important for or useful to the consumer to possess the article. But the demand for armaments differs in several respects from the demand for ordinary commodities."

And we set out four respects, as we see them:

"1. A manufacturer of commercial goods who increases his sales in a foreign country does not, by so doing, increase his home demand; in the case of armaments, he does. If an English firm builds destroyers and submarines for a foreign government this tends to lead to a demand for an increase in the British Navy.

"2. A foreign manufacturer who increases sales in his own country, does not by so doing increase the demand for the commodity in our country, but in the case of armaments he does. If Krupp can persuade Germany to order more artillery, this leads to a demand for more artillery in England.

"3. In the case of armaments the consumer is the state and has great wealth or resources; thus if the state can be persuaded that armaments are necessary, they will be bought whatever the cost. But however necessary commercial goods may be, a maker cannot increase his sales among the poor.

"4. In the case of armaments the consumer is the state and the usual methods of advertising are not efficacious; they can, however, be replaced by the interested parties working up a patriotic agitation. Lord Snowden's speech on the Naval Estimates in 1914 made Members of Parliament aware of the way in which the scare of 1909 was managed.

"Thus, whereas the interests of ordinary men lie in peace and security, the interests of those who live by the sale of arms and materials of war lie in fear, insecurity, and ultimately, in war."

That summarises our objection to private trade in arms, both at home and abroad; but abroad we have the tendency—and I am dealing with the tendency—to corruption through secrecy and lack of publicity, and I shall give you chapter and verse for this. Finally we say that the present system is an inefficient system through inadequate organisation, and in the case of heavy steel and heavy ordnance an out-of-date and inadequate works layout, coupled with the lack of any adequate control. 1042. *Chairman*: The scare of 1909 which you speak of is, I suppose, the Mulliner incident?

Sir William Jovitt: Yes, Sir.

Now I want to say a word or two about corruption. We are, as I have said, frankly, Socialists. Those for whom I have the honour to appear may be

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

thought to be prejudiced about this matter, and therefore I do not want to put this case only from our point of view. I want to put this case from the point of view of an arms manufacturer describing the situation as he sees it in the Balkans. This is one of the letters which came out in the American Inquiry. The letter is dated 10th October, 1922, and it is at page 2,595 of the American proceedings. It is a letter from the sales manager, a Mr. Taylor, to his company, the Du Pont de Nemours Company, the big explosive manufacturers in the United States of America, describing what happens when he goes to try and sell his wares in the Balkans.

1043. *Chairman*: But is that a matter which I can admit? It is a letter from whom to whom?

Sir William Jowitt: It is a letter from Mr. Taylor to the Du Pont de Nemours Company. I want to show you at any rate this: It is commonly believed and commonly conceded that the method of selling to small foreign countries such as those in the Balkans is this. You go to them, and you have to persuade some officer of state, be he the minister of finance, or the minister of war, or whatever he may be, that he will get a very substantial commission if he will place an order for your goods, and unless you do that you cannot sell your wares at all. It is also known that in order to get his commission he does thereupon place the order. The result of his placing the order, and the country buying the wares, is therefore that the neighbouring country is forced to buy also. I propose to read this letter, with your permission, to show that that is a view which is not held by mere uninformed people, or advanced people like my clients, but it is held by an arms manufacturer who is himself out on the spot. I then propose to show you, if I may, that so far as the British arms firms are concerned there are two letters written by a gentleman who is concerned in it, saying that he realises that what he euphemistically calls "grease" has got to pass in these arms transactions.

1044. *Chairman*: I cannot admit this letter, nor can I admit without evidence any statement that bribes are given to representatives of foreign countries. You may put that forward as a hypothetical case, but you cannot put it higher than that; and of course the other letters you refer to, if they are written by representatives of a British firm whom we can have here and examine, that is another matter.

Sir William Jowitt: Then, Sir, this letter is not written by a representative of an English firm. It is a gentleman in the Balkans indicating what English firms do.

1045. *Chairman*: What he says English firms do; but I cannot admit that letter as evidence on that?

Sir William Jowitt: Is it not material, then, if it only goes to this question? Is it not at all material to you to know that this is a statement which is commonly believed? Because I can conceive that if people, whether rightly or wrongly, believe that there is this graft, and this discreditable work done, that at any rate in itself, true or false, may be a reason for doing away with the private trading in arms.

1046. *Chairman*: We have had abundant proof that people believe it, whether rightly or wrongly; but that is another matter. I cannot admit it. It is outside the ruling that I gave as to the way in which we shall conduct this Inquiry. We are quite prepared to admit any letter written by an English person whom we can call as a witness, and whom we can examine as to the correctness of the contents of a letter, but a letter of this kind we cannot admit.

Sir William Jowitt: Then I will ask you this. You will see that in this letter a particular man is mentioned. I would ask you to call that man, or to endeavour to secure a witness who shall come and give evidence before you.

1047. *Chairman*: Yes. Have you given the name?

Sir William Jowitt: Sir Basil Zaharoff.

1048. *Chairman*: Yes; we have had his name mentioned before.

Sir William Jowitt: I shall ask you to see that Sir Basil Zaharoff is brought to give evidence before you. I do not think your ruling applies to the letters from Captain John Ball, of the Sole Armament Company, to the American Armament Corporation, whom he is making his sole agent in America, because those letters are written by somebody who describes himself at any rate as being an agent to our Government for the sale of arms. He writes this at page 672: "As we are really the sole selling channel for small arms, etc., which belong to the British War Office," and so on. On page 675 he writes this: "We fully understand that arms deals are not usually done without some officials getting 'greased' but if any palm oil is required, it has to be added to the price, and as our prices are at least 50 per cent. less than factory prices for the same arms, they will stand a lot of 'grease' and still be cheaper than the manufacturers' prices." The answer you will find comes at page 684, where the American firm say: "Your remarks anent greasing the wheels that make the deals go around are very true and we fully appreciate that very often oil must be added to your quotations. In this connection will you make it a point to always quote us your prices net to us c.i.f. New York."

The writer of the other letter I referred to—I was not aware of this at the time, or I should have told you—is the joint agent of the Du Pont de Nemours Company and I.C.I. Under those circumstances does your ruling hold, or do you rule that that letter may be read?

1049. *Chairman*: Well, the exact passage in our ruling which I gave when we commenced these Proceedings was: "In the case of firms and individuals resident and carrying on business abroad, and of transactions taking place wholly abroad, it is clearly not practicable for the Commission to carry out any satisfactory investigation of allegations that may be made. The Commission, however, will not decline to allow witnesses to cite, in support of an argument, cases in this category which have been the subject of public allegation or report."

Sir William Jowitt: That has been the subject of public allegation and report, and formed the subject of inquiry before the American Tribunal.

1050. *Chairman*: You say now that Taylor is an agent of whom?

Sir William Jowitt: Of Imperial Chemical Industries, of London. He is a joint agent for that company and the American company of Du Pont de Nemours.

1051. *Chairman*: Will you just leave this for the time being, Sir William? I will deal with this after the adjournment.

Sir William Jowitt: If you please, Sir.

1052. *Chairman*: Let me just look at the letter again. I do not want to exclude anything that under my ruling ought to be admitted.

Sir William Jowitt: It is at page 2595. We include this gentleman, under the heading of "Imperial Chemical Industries," amongst the list of witnesses whom we hope you will call before you.

1053. *Chairman*: But is he in this country?

Sir William Jowitt: I believe he is in Paris.

1054. *Mr. Spender*: Is he British?

Sir William Jowitt: That I do not know, Mr. Spender.

1055. *Chairman*: I will deal with it after the adjournment, because I should like to read the letter through before I give a final decision.

Sir William Jowitt: If you please, Sir. We have a phrase which is certainly corroborated in the letter which I read to you from Mr. Ball, that in selling arms to small countries, officials—and that of course means officials high up—have to be "greased."

1056. *Chairman*: You say "officials high up." I do not think you ought to jump to this sort of con-

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

clusion. I do not know who the officials are. They are officials, yes.

Sir William Jowitt: I am not talking about this country at all, Sir John.

1057. *Chairman:* No, I agree.

Sir William Jowitt: That is why, of course, one wants to read these letters, because, not having had any disclosure, in the nature of things it is impossible for us to give chapter and verse for these things. We can only say it is commonly believed by those concerned in the sale of arms. We do not suggest, Sir John, for one moment, that anything comparable with that goes on in this country at all. Of course, it is ridiculous to suggest that the Chancellor of the Exchequer could be bribed, or that anybody in that sort of position could be bribed. We do not suggest it for a moment, but what we do say, and what we ask you to consider, is this. We set out in Part VI of our statement of evidence* the very large number of people who are in control of the armament firms to-day, who have come, and come directly, from government offices; from responsible and important positions in government offices they have gone straight over to the arms firms. Now, let me make it quite plain that I am not making any suggestion against the good faith of these people. I have not the slightest evidence that any one of these gentlemen has ever been actuated in any improper way—not the slightest—and I am not going to make any suggestion against any one of those gentlemen. But I do suggest that a system whereby those who are responsible for contracts, or for engineering design, or whatever it may be, should frequently and habitually go over to the armament firms, is a very undesirable system as a system. I realise, and it is perhaps fair to say this, that such a system is perhaps inherent in the private trade in armaments. You cannot run an armament firm if its directors and management are going to be—what shall I say?—a lot of lawyers. You must manifestly have people who understand about submarines, and ordnance, and big guns, and so on. Such a system must be inevitable. If it is inevitable, it is another additional and strong reason, as we say, and as we see it, against the private traffic in arms. After all, it must tend to put a man in a very difficult position. Take a man like an engineering director, or a director of contracts, who has every reason to hope for a position. Suppose at the end of his time he will be taken into, say, armament firm A.B., and whilst he is still in government employment, and has control to a certain extent, a question comes up as to what firm is to have a certain contract allotted to it. Now, I have no doubt that these people do the best they can in the government interest, and do not allow themselves to be actuated by any improper motives. But I do say this: Any system which allows a man to be placed in a position where his duty and his interests may conflict is a bad system, and for that reason we call your attention to this state of affairs, and we say it is very undesirable that it should continue to exist, and we say that in certain cases it has given rise to trouble.

In that connection the case of Mayers has been quoted frequently. You will remember the position there. There was a man who had no corrupt motive. He was found guilty, but merely bound over. He had left his position, and he had taken with him certain documents which he had—plans—which he had in his possession as a government servant, and had taken them over with him when he was transferred to his new post in an armament firm. The matter has been dealt with in the American Inquiry, in Part I of the Proceedings, and this evidence is relating to an Englishman, and therefore is not subject to any bar under your ruling. It is Exhibit No. 172 at page 438 of Part I.

Commander Craven is writing to Mr. Spear:—

“MY DEAR SPEAR: I have purposely not written to you about Mayers because I thought it only fair and right that I should not do so

until after the result of his trial. He appears at the Old Bailey next week and all I can tell you is that the case will be tried in camera and that the charge is a serious one.

“I have very definite assurances from Lord Beatty, from the Director of Naval Intelligence at the Admiralty, and from the Chief of Staff of the Submarine Service (who was largely responsible for my taking Mayers on) that Vickers can in no way be implicated. Even when the trial is over I do not think I shall be able to let you know the whole story until we meet, which I hope will be before long.”
Then in the next Exhibit, No. 173:—

“MY DEAR SPEAR: For your private information, Mayers has called me for the defence. I told the Admiralty I was afraid he would do so if they did not call me for the prosecution. However, it will give the prosecution a chance of getting out of me exactly why I engaged Mayers, and I have so far received definite confirmation from Lord Beatty that, in taking Mayers, Vickers acted in the interests of the Admiralty and they apologize for the trouble they have landed us into.
“Lieut. Commander Cumming, who is a submarine officer of considerable standing, has recently joined my staff.”

That is a case of a man definitely placed, by direct transference from government service to private service, in a difficult position in which he certainly made what the judge trying the case described as a serious error of judgment. But we ask you to say that these young men should not be put in a position where they can make serious errors of judgment of that sort. In that connection I call your attention to Part VI of our evidence, under the heading “Armstrong-Siddeley Development Co.,” and particularly to the facts in relation to Mr. Green. He was allowed to take with him the drawings and all the information which was available on air-cooled engines, and it was on the basis of that information that Armstrong's engine work has been built up. We ask you and invite you, in the course of the inquiry, to investigate and see whether that is so, and to say whether it is right that some people may take their drawings and some may not, and relate it to the question of whether that procedure does not give scope for errors of judgment of this character.

It is this atmosphere of suspicion, which I think is quite commonly and not unreasonably felt, that casts a cloud over our minds when we are reading some of this evidence, and makes us suspicious, when we read that letter which has been referred to before at page 406 of Part I of the American evidence. Commander Craven writes thus:—

“I wonder whether you have heard that our old friend Percy Addison is now the director of dockyards. I helped him all I could to get the job, and I think he will be an ideal fellow for it. It means his retirement, but it also means his having a permanent job for about ten years if he behaves himself, and as he has no private means worth talking about, you will appreciate what this means to him. I have suggested to him that you and I, and he and Johns (who is anxious to meet you), should have a party and thoroughly wet the appointment next time you are over here.”

Now, I conceive it to be quite possible that that letter is capable of an innocent explanation. I conceive it to be, on the other hand, unfortunate that all this matter has to be looked at in this atmosphere of suspicion, which I think is not unreasonable suspicion, and I, on behalf of the Union, certainly invite this Commission to see that that matter is, in the public interest, very thoroughly probed.

For the rest, I would say this. We submit that one of the problems inherent in a system of private traffic in arms, at home as well as abroad, is that the people you employ to help you and to conduct that service, most, in the nature of things, be people who are largely drawn from those services—the fighting

* Appendix pp. 199 and 200.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

services—which they have just left; and we suggest that that is an undesirable feature in our public life.

Now, Sir John, the next objection we make to private traffic is that it must tend towards militarism; and I cannot do better than quote, in support of a point of view which I suppose is not capable of any exact scientific proof, the words of Lord Wemyss—who, after all, cannot be considered as being a sloppy pacifist, or anything of that sort—which we have thought right to set out at the beginning of Part V of our evidence.* I would call your attention to these words: “. . . the following reference is made in a memorandum drawn up by Lord Wemyss and Mr. W. Harbutt Dawson:

‘Apart from the moral objections to the present system, which makes warfare a direct occasion of private gain, the system is attended by the inevitable consequence that the multiplication of armaments is stimulated artificially. Every firm engaged in the production of armaments and munitions of any kind naturally wants the largest possible output. Not only therefore has it a direct interest in the inflation of the Navy and Army Estimates and in war scares, but it is equally to its interest to push its foreign business. For the more armaments are increased abroad, the more they must be increased at home. This interrelation between foreign and home trade in armaments is one of the most subtle and dangerous features of the present system of private production. The evil is intensified by the existence of international armament rings, the members of which notoriously play into each others’ hands. So long as this subterranean conspiracy against peace is allowed to continue the possibility of any serious concerted reduction of armaments will be remote.’”

Now, Sir John, in your terms of reference you are asked to consider and report upon the practicability and desirability, both from the national and international point of view, of the adoption by the United Kingdom alone, and by the United Kingdom in conjunction with other countries, of a prohibition of private manufacture. Many people will say: “Well, desirable as this thing may be, it is impossible that any other country should follow suit”; and therefore I will remind the Commission of that with which I have no doubt they are fully acquainted, that the French, Danish, Polish and Spanish countries have already made this proposal. Other countries have insisted that the trade should be internationalised, but at least it would seem probable that if we will only take this step, there are other countries, France included, who will be only too ready to follow us. And you will remember, Sir John, that so far as Sweden is concerned, by a law which becomes operative in 1938, the Swedish Government have already arranged that the manufacture—altogether apart from the export—the manufacture of arms shall be put under most rigorous public control; not state manufacture, but public control.

We call attention to the fact that the advertisement by British firms of arms abroad may have an unfortunate effect on the belief which people have as to the pacific intentions of our Government; and it is the fact, for instance—you can send for the papers—that Vickers have been advertising in the German papers from April, 1932, to March, 1933, in the papers *Militär Wochenblatt* and *Wehr und Waffen*, which are monthly papers, advertising their tanks for sale and describing their merits and advantages.

I pass from that to ask you to consider what perhaps has not been put to you before. What are the ramifications of the armaments trade in this country? What does it consist of; what are its connections at home; what are its connections abroad? We have gone through this matter as carefully as we can. We cannot, of course, hope to have

the information which will be forthcoming in due course to you in the course of your inquiry, and from the skilled investigators whom you may employ, nor can we hope to have as much information as the Government. We think it right, however, to call your attention to this piece of evidence that should combat any evidence which may be brought to the contrary effect. It is an answer given by our Government, and, as we suggest, it is a very remarkable answer. A Committee of the Disarmament Conference determined, in view of the suggestion of the French Government to make an end of the traffic in arms, to find out, by means of a questionnaire in each country, what the position of the arms traffic in each country was. This is the questionnaire which was addressed to the various states, and I am going to read our Government’s answer: “What undertakings in the territory under the jurisdiction of your State are chiefly, or largely, engaged in the manufacture of the articles coming under categories I, II, III and IV of the 1929 draft Convention . . .”—that would be roughly arms and armaments, Sir. Our Government answered that question in this way; they set out the list of their state factories, the Royal Arsenal, Woolwich, the Royal Gunpowder Factory, Waltham Abbey, and so on, eight of them in all, and then they say:

“With the possible exception of certain firms manufacturing sporting weapons, and a few firms manufacturing aircraft (civil and military), there are no private undertakings in the United Kingdom which can strictly be described as engaged chiefly or largely in armament manufacture. Even the largest firms, such as Vickers-Armstrong, making armaments in this country, devote only a portion of their time and output to this form of work, their other activities being entirely unconnected with armaments.”†

They say “devote only a portion of their time and output,” they are not “chiefly or largely engaged in armament manufacture.”

That is the evidence, and I felt it right to bring it to your attention as a most astounding answer to anyone who knows the facts. It certainly would be an astounding answer to Sir Herbert Lawrence, who was chairman of Vickers and Vickers-Armstrongs, because he, on the 4th April, 1932, eleven months before our Government gave its answer, at the general meeting of Vickers, Limited, dealing with Vickers-Armstrongs—in which firm Vickers hold the bulk of the shares—says: “Vickers-Armstrongs depends very largely on armaments for its existence.” And yet eleven months later, our own Government says that there is no firm largely engaged in the production of armaments. I have a catalogue of Vickers-Armstrongs before me. They say here: “The production of armaments is an important item of the engineering products of the world.” They show you guns which they have frequently made for the Italian, Spanish, and Peruvian Governments, the Lithuanian Government; and they deal with their howitzers, and they deal with under-water warfare. They say in that section dealing with under-water warfare that they are in the unique position of possessing the world patent rights of all the useful modern developments in connection with submarines, mines, depth charges, and paravanes.

I call attention to the phrase “the world patent rights,” because the world, of course, includes Germany; and in due course you will no doubt wish to inquire—at any rate we suggest that you should—what are the arrangements between Vickers and the various German firms. We suggest to you that it is an astounding view to take, and we do not believe, nor do we suggest that you will believe, that the directors of Vickers-Armstrongs would support the suggestion, that Vickers-Armstrongs is not

† League of Nations Publications: IX Disarmament. 1933. IX. 7. (Conf. D. 100)

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

largely, and is not mainly—I will not say mainly, but at any rate largely—engaged in the production of arms.

Now we come to what I think is a particularly telling part of the evidence which we have been able to collect for you. We find that the armaments trade falls under several headings and groups to which, I think, wholly different considerations apply. Let me just run through them. There is first of all, of course, the heavy armaments. By that I mean armour plate and heavy ordnance. You will find that the facts there are that in a comparatively defined area there are three or four firms very closely inter-connected, who are alone responsible for that part of the industry. I shall have presently to call your attention to certain points which make us say that the organisation and lay-out of that industry is thoroughly inefficient. If one includes ships—of course very different considerations arise as to ships—you will find, if you look through that part of our evidence, that there are many more firms, that they are much less closely connected, and I know, by the reason and the very nature of things, there is, and indeed must be, a different legal position. No firm in this country could start building a ship for a foreign government without getting the approval of our government before it does the first thing towards it. It is not a question of getting an export licence after you have made the things. It is manifest that you must get approval first of all. Further, of course, with regard to the building of ships you have more publicity. Anybody who has interested themselves at all in these matters must know what ships are being built for what government in this country.

Therefore you have a division of the arms industry, heavy arms and ordnance, which supply the armour plates for the ships; and what differentiates a warship from an ordinary ship is, of course, very largely the fact that the warship has heavy armament, heavy armour plate and heavy ordnance. Therefore ships are in a different position.

Then you come to the chemical industry, with its application to explosives and poison gas. There you find the matter very largely, of course, in the hands of the I.C.I.; and just as those who have put this case together have said that in the case of heavy armaments they regard the industry as completely inefficient, in the case of the I.C.I. they say, speaking by and large, that the production is very efficient—the production is efficient, and the organisation good. They are responsible, of course, for explosives; but it is not, like it is in the case of heavy armament, a main or a large or a chief part of their business; it is comparatively small, of course, compared to their business as a whole.

Then I pass from the chemical industry, which I will deal with in due course, to consider the aircraft industry. Here you have again a completely different problem. You are not suffering from the old-fashioned lay-out which you have tinkered with and tried to bring up to date. You have got a more or less empiric industry springing up, you have got a considerable number—as we know, if we read the papers, almost every day the number is increasing—of private firms who engage in aeroplane manufacture. I shall call before you on this topic a witness who can speak with great authority, and he will point out that that industry is being inefficiently run, for this reason. It is quite obvious that we are wanting to try out all sorts of types, but it is equally quite obvious that the kernel of that industry ought to be the research department. You ought to get some of your finest scientists in this country thinking this problem out, and what they think out in their research work ought to be made available to all these people. At the present time you have many of these firms indulging in their own little bit of research, which too frequently may overlap with other research, and which of course is not made available to the others. In so far as they are on government research, the government officials are placed in a particular difficulty, in that if they are asked by A.

to make certain inquiries, they obviously cannot reveal the result of those inquiries to B. Thus you have an industry which for those reasons is inefficiently conducted and inefficiently run. It seems to us that it is really unscientific to talk about the arms industry as a whole, as though you could necessarily apply the same arguments and the same canons to one group of armaments as you can to another. I am afraid that I have not a great knowledge of this subject, but the greater knowledge of the subject, the great knowledge which is set out, as I think everybody will agree, in this evidence, makes us understand that we have got to consider each of these three categories separately, and that arguments which apply to one do not necessarily apply to another.

I propose first of all, therefore, to consider the heavy armaments industry, and in considering that I will say a word or two about small arms. In Part IV of our evidence, we set out the position under Chapter 2.* We say there: "Armour plate and steel for heavy ordnance is manufactured by three firms only. These are the English Steel Corporation, William Beardmore & Co., and Thomas Firth & John Brown." Now, let me say a word or two about those companies first of all. Vickers are a holding company, and Vickers hold the shares in Vickers-Armstrongs. Vickers-Armstrongs is in a position of controlling the English Steel Corporation, so therefore the English Steel Corporation and Vickers-Armstrongs may be treated as being one. With regard to William Beardmore & Company, the position is less certain. Investigation will easily enable you to find out what the position is, but I think I should be right in saying that by very large holdings of preference shares—Beardmore is now run by trustees for the debenture holders in the Law Debenture Corporation—substantially speaking, we see here that Vickers-Armstrongs controls William Beardmore & Company. Thomas Firth & John Brown are not controlled in the sense that the English Steel Corporation or William Beardmore & Company is, though their inter-connection, as I shall show you in a moment or two, is very close. The inter-connection arises as follows, but before I mention that I had better just refer to shells. We see the position with regard to that in the third paragraph. "Shells and armoured turrets are manufactured mainly by Hadfield. Vickers and Firth Brown do make a certain number of shells, but by far the most important shell firm is Hadfield." So you have got to consider Vickers, John Brown, Hadfield, Beardmore, and the English Steel Corporation, and of those five firms, two of them, namely, the English Steel Corporation and William Beardmore, are controlled, or substantially controlled. The other two, Hadfield and Thomas Firth & John Brown, so far as Somerset House records go, are not; but, on the other hand, there is a very nice community of interest, and we set out the nature of that community in the succeeding paragraphs.

First of all, steel for armament manufacture has to be made from the very finest ore procurable, and in the old days there was a company called the Carnforth Haematite Iron Company, which concerned itself with the production of ore. That ore is now provided, we believe, largely from Sweden. You will no doubt investigate it, but we believe that there are Swedish companies occupying the old position of the Carnforth Haematite Iron Company, who still have their interests, but they naturally would not be revealed at Somerset House, and therefore we cannot say definitely, one way or the other.

We want ore, and then we want firebricks, or rather, somebody wants them; and we set out that there is a company called the Oughtibridge Silica and Fire Brick Co., in which the English Steel Corporation hold a large block of shares. We say: "The control is largely in the hands of the English Steel Corporation who hold out of the 177,800 shares some 19,500 in the name of Vickers and another 19,500 in the

* Appendix p. 175.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

name of Cammell Laird. The interests of the English Steel Corporation, through Vickers, in the Parkgate Iron and Steel Co., give them another 19,500 shares. Among the other shareholders are Hadfield with 19,500 and John Brown with 16,700, and Thomas Firth & John Brown (controlled by John Brown) with 22,300." So that in connection with their firebricks they are obviously very closely related.

Then I come to nickel. Nickel is, as you know, and as we set out here, a very expensive raw material, costing about £200 a ton, which must be used for high class steels such as armament steels, and it is very interesting to see what steps the armament firms have taken in order to ensure that they have sufficient nickel; and I am going to say a word or two about that when I come to consider their international importance, because you will find that they are linked up there internationally as well as nationally, in order to get their nickel.

Then we state the position in regard to electric appliances, and set out the details relating to John Brown, Cammell Laird, and the Fairfield Shipbuilding Company, forming together the English Electric. Then later on—I do not think I need trouble to read it—we set out with a wealth of detail the international connections.

Broadly speaking you may say that John Brown and Hadfield are very closely associated both by the various industries I have indicated, and also the banking arrangements with Vickers-Armstrongs and the English Steel Corporation set out on the ninth and tenth pages of Part IV. So far as Vickers abroad is concerned, I do not think these facts would be controverted. The firm holds large and important interests in a Polish company, in an Italian company of the name of Terni, in a Rumanian company known as Resitza, and in a Japanese company which again links up with Mitsui, and a Spanish company. The precise extent of the holding does not very much matter; you can get that very much more authoritatively from other sources which you have at your disposal than I can. I believe I am right in saying that the Spanish company at any rate is controlled, that the Rumanian company represents an interest of 30 per cent., and that the other companies are very substantially controlled.

Now, Sir John, of course in the linking-up of Schneider, the great French group, who of course in their turn control Skoda, you find a very close community of banking interests in the pages which we have referred to. You will also find this. First of all, if you look at Part V* of our evidence, you will see an extract from an agreement made the 3rd January, 1928, between Vickers Limited and Vickers-Armstrongs Limited, and we set out a part of the fourth schedule. There you will see: "The benefit of all agreements, and arrangements entered into by the Vendors for rendering technical services to others in connection with armaments, but subject to the obligations binding upon the Vendors in respect thereof including agreements and arrangements with the following Companies," and you will find that No. (4) is "Vickers-Schneider."

Therefore one would infer that there was, or at any rate had been, a company called Vickers-Schneider; but Sir Herbert Lawrence has stated that there never was such a company as Vickers-Schneider, and therefore the reference there to Vickers-Schneider presumably could only be that there was some company contemplated for some purpose or other which was going to consolidate the interests, or concern itself with the joint interests, of Vickers and Schneider. I cannot go further than to call your attention to that passage, and to tell you frankly the explanation which has been given, in order that, in that connection, you may make, as you no doubt will make, such inquiries as you think proper.

But I promised to say something about nickel, Sir John. The nickel situation is remarkable. There was founded in, I think, 1901, a company called the Steel Manufacturers' Nickel Syndicate. Its object, as expressed in its Memorandum and Articles, was to secure that prompt and satisfactory supplies of nickel should be available to all its members. The exact words are: "The object of the Company is the purchase and distribution amongst members of, *inter alia*, nickel cobalt and other ores"; and the Memorandum of Association provides for the distribution of assets in the form of specie. The original directors were a gentleman called Sigmund Loewe, a director of Krupp—he is returned in Somerset House only as a director of Vickers—and Captain Tresidder, and Mr. Clark, and Mr. Noble, of Armstrongs, and Mr. Beardmore, of William Beardmore, Limited. In the year 1914, at or shortly after the outbreak of war, its members were as follows; they are stated in Part V of our case. Apart from various clerks who hold one share, and whom I will leave out and group with the main holders, you will see that the fifth name down is that of Cammell, Laird & Company. They are English; Vickers, Ltd., are English; Tresidder is described as a steel manufacturer, but was managing director of John Brown and Armstrong-Whitworth; and then I will leave out some, if you will allow me to do so, until we come to Hadfield and Beardmore. There are six well-known English firms there, each of them with 125 shares. Then the Germans and French, who are also members, had an equal number of shares. The Germans you will see just under Armstrong-Whitworths. They are Fried Krupp Aktiengesellschaft, with 125 shares, then—leaving out the next one—Der Dillinger Hüttenwerke, with 118 shares, with a nominee which brings them up to 125 shares, and then there is one other German or Austrian firm, Witkowitz-Bergbau und Eisenhütten Gewerkschaft, Austrian steel manufacturers, with 125 shares. The French had a corresponding number: The Schneider Company, 125 shares; the Compagnie des Forges de la Marine, 125 shares; and the Compagnie des Forges de Chatillon, 125 shares. So that the English on the one hand, and the French and Germans on the other hand, exactly balance; and the balance of the shares was held by an Italian Company, whose name you will find, the Società Di Terni, of Rome, who, as I have said, are a company in which Vickers had, and I believe have, a substantial though not a controlling interest.

That was the position, you will see, at the 23rd October of 1914. The present position of the company is worth looking at at the moment, because it leads to obvious scope for inquiry. On the following page of the statement of evidence I would call your attention to this. First of all, you will see the last three names, 248 shares, 1 share, and 1 share; that is 250 shares. They obviously represent the old Vickers and Armstrong Whitworth holdings. They each had 125 shares before, and now they have 250 shares between them. The first name is Beardmore again, and it has still got the 125 shares. The third name is Bishop. He represents what Tresidder did in the old thing; he has got his 125 shares as a nominee, of course. Then the English Steel Corporation, they are the same now as Cammell Laird, in the changes that have been made; the English Steel Corporation have taken over Cammell Laird's interest; and Hadfields are still there. So that you will find, if you work it out, that the six English firms, with the necessary changes, of course, by reason of alterations, are still there. The three French firms are still there, the Forges de Chatillon, the Forges de la Marine and Schneider are still there. Terni, the Italian firm, have still got theirs, but the 369 shares which were previously held by the Germans are now held by Mr. Arthur Stanley Chappell, of 20, Marham Gardens, Wandsworth Common, S.W.18. He is Secretary of the Steel Manufacturers' Nickel Syndicate, Ltd., and that with the odd ones makes up the 375 shares originally held, and it is obvious he is a nominee shareholder for somebody. At the moment

* Appendix p. 197.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

we have no means of finding out what the holding is there; but the continuance of this company shows, as we argue, certainly that at the outbreak of war, and for some few weeks after the outbreak of war, all the main arms manufacturers of the world were at any rate united together to make suitable arrangements to buy nickel and provide nickel for their various members. To-day, in 1935, at the present time, the German shareholding has dropped out, and the secretary of the company holds what were the German firms' shares, no doubt in the interest of somebody. Who that somebody is I have no idea, and you may think it proper to make inquiries as to it.

Thus these arms manufacturers of the heavy arms trade are very closely linked together, and closely linked together not merely nationally but internationally. Indeed, they have all the outward signs and symbols of what we call an arms ring.

Now, confining myself to the heavy arms for the moment, may I show you our criticism of it in Part VIII*. One can deal with this without too much elaboration, I think. It is sufficient to say that having shown you who these firms were, you find that set out under *Technical Losses* are the names of the firms and the localities of their works. It is sufficient, I think, to say that in a comparatively defined area those people do their work and have their being. But at the same time they of course are the inheritors of works which have grown up from much earlier days, when requirements were very much less, and there never has been, as there ought to have been, that sweeping rebuilding, instead of mere tinkering, which both the American Steel Corporation and the Thyssen works have carried out. They, realising the importance of getting an adequate and up-to-date organisation and lay-out, have scrapped entirely, instead of merely tinkering with what they had, and they have built the most up-to-date works possible.

We suggest that the taxpayer would be saved a great deal of money if in this country the same thing was done in regard to armour steel, this heavy armament steel, which can be very clearly differentiated from ordinary steel both by reason of the completely different process which it goes through in its life history—we have set out all the details here—and also by reason of the fact that its manufacture is concentrated in very few hands, and it is perfectly easy to separate and segregate it.

A question of policy would arise, however, which I will just sketch shortly, and that is this. From the point of view of efficiency in manufacture it would be very much more convenient to have all your works organised together, laid out together, to enable you to produce exactly what is required, and preferably very near a shipbreaking yard where warships are broken up so that you can use the scrap, the same class of material, for making your new steel. Whether it would be a wise policy to put all your eggs in one basket in view of the new forms of warfare, which you know about, and into which I need not go, or whether it would be considered desirable not to have one place only, to have three or four widely separated points, I am not in a position to express an opinion. But I would point out that under the present system you have got the worst of both worlds, because you have got a comparatively defined area, and at the same time you have not got that controlled and unified organisation and lay-out which we suggest you ought to have, and from that point of view we say the present system is very inefficient.

We suggest, and the details are given in Part VIII, under the heading *Technical Losses*, that "When a works is laid out for the production of several types of product, it is obvious that the lay-out cannot be as satisfactory as if it were designed for one product only. For example, the armour plate departments of E.S.C."—the English Steel Corporation, formerly Cammell Laird—"are situated fairly close together,

but even so a plate must cross the main Sheffield-Doncaster road by a level crossing no fewer than four times in the course of its production. A distance of three-quarters of a mile separates two armour plate departments of what was formerly Cammell Laird's works at Grimesthorpe and Cyclops, and though the latter works is not producing at the moment, arms products have still a rail journey to make from Grimesthorpe to the River Don works. There is a big transfer of steel between E.S.C. and its subsidiary company Industrial Steels—13 miles apart—and Firth Browns manufacture steel in their Atlas and Norfolk works to be finished in the Tinsley works."

That we believe, and we give reasons here, to be a thoroughly inefficient lay-out. If we had a modern Mr. Ford in this country, who was organising works, we do not think he would stand for or tolerate that for one moment.

We set out in the second argument that the administration would be vastly simplified if you had a factory to make one class, and one class only, of this steel. We point out that so far as the control of materials is concerned, one of the most important matters in the steel works is to be quite certain that the scrap that you are going to feed to your furnace is the right sort of scrap, and that involves an infinity of stock keeping.

Then a little lower down we speak of *Compromise in plant*, and we point out that in one case we tried to turn the lathes which were on armament work to commercial production, and had to give it up; it was quite inefficient. You see the details are given of that, and, in short, we suggest that one factory concentrated on the production of this very high-class steel, in conjunction with a shipbreaking establishment, would be a far more efficient method than the present one.

We then deal with what we describe as *General Inefficiency*, and just before *Commercial Losses* you will see this: "Instances similar to these can be recited *ad nauseam*, all going to show that there was little coherence in the technical planning of the company. It was realised that the works site was not of the best, and the chief engineer and others inspected a site at Poole, bordering on the sea. Chiefly on the score of the distance from coal the scheme of moving the E.S.C. works away from Sheffield was turned down. Instead the River Don works have been repaired piecemeal. The melting house was brought from Penistone, forging presses from Openshaw, machine tools from Openshaw and Grimesthorpe, and drop stamps from Elswick. As a contrast to this, the United States Steel Corporation and the Thyssen group in Germany have abandoned the practice of reconstructing a works that has fallen behind. They allow it to carry on while they set up new works of the most advanced type to take its place; when that is ready the old is dismantled and either abandoned or rebuilt entirely. The other heavy arms firms do not appear to be run on any sounder lines."

If it be asked how, despite these inefficiencies, they manage to continue in business, the reply can be found in a slight twist of the famous question and answer: "Why do heavy arms firms make profits?" "Because they only have other arms firms to compete with."

Now, we suggest, Sir John, that the matter should be taken over by the government, that the government should run an efficient, up-to-date works. If the old argument of expansion is put to us—and we realise that expansion is necessary—we call your attention to the passage on the fourth page of Part VIII, about three-quarters of the way down the page on the right hand side, which shows you exactly what the available furnaces are. Those are what you have got. These are not things that you can elaborate or improvise quickly on the outbreak of war. They are not like shell making machines, or anything of that sort, where you can at very little notice turn your machines on to making shells. They are

* Appendix pp. 206 to 210.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

the furnaces you have got making heavy ordnance and armour plate, and on those you will be dependent, whether you have private control or public control. We should suggest, and we do suggest on that page, that the right time to have a ministry of munitions is not after a war has broken out, but before it breaks out. By a ministry of munitions I mean of course some government department concerned to see into these matters, and we would suggest and readily accede to the view that the amount of plant and furnaces is a matter which in the nature of things cannot be improvised, and which should be run in a thoroughly up-to-date manner, and technically should be such as to allow you room for reasonable expansion in the event of an outbreak of war. But we ask that the taxpayer should be preserved from the inefficiency of the present system, which, as I have said, has in a small area all the disadvantages of an old-fashioned lay-out, and none of the advantages of a consolidated, up-to-date, improved position such as, we are bound to say, you do broadly speaking find with the L.C.I. in its chemical industry.

1058. *Chairman*: Have you finished with the heavy armaments?

Sir William Jowitt: Yes.

1059. *Chairman*: Are you going to call a witness on heavy armaments?

Sir William Jowitt: No, I am not, Sir. I have nobody I can call.

1060. *Chairman*: At some time, some of us will want to ask some questions in connection with the explanation of some of the passages in your evidence. Then, if there is to be no witness called on this point, we should have to ask you about it?

Sir William Jowitt: Yes, Sir John, certainly.

1061. *Chairman*: Would it be convenient for you to do it when you have finished your statement as a whole?

Sir William Jowitt: It would be very convenient personally, in that I do not pretend to be a technician, if you would let me know on what line your questions would be, so that I can find out during the interval what the proper answers are. Otherwise, if it is not a technical question, I should be pleased to give the answer which I believe to be the correct one. If they are broad questions of principle, I shall tender Lord Marley as a witness, though he does not pretend to be a technical expert on any of these engineering matters. I will tell you exactly, in order that you may decide, the witnesses I propose to call. I have got here—

1062. *Chairman*: I think it would be probably better that you should finish your statement. We know now that there is no evidence coming on heavy armaments, and therefore we must deal with that independently of the other sections.

Sir William Jowitt: Certainly, Sir John.

Then I said I had finished with heavy armaments, and in a sense I have; but I suppose one ought to include the building of ships of war in the category of heavy armaments, and the facts are set out there on the sixth page of Part IV of our case.* You will see there, and it is fair to say, that the matter is differentiated in that we do not here make any attack on efficiency. You have got, though not a large number of people, a considerably larger number of people than you have in the heavy arms industry. You have got, as I have already pointed out, of course, by reason of the very nature of the thing, a measure of publicity in connection with shipbuilding which we seek to have in connection with the manufacture of arms, and you have also got this advantage, of course, that you cannot start building a ship for a foreign country unless you get the approval of your government here. It is not merely given *ex post facto*. The facts in relation to it are set out, and you will see that

there are six main firms, Vickers-Armstrongs; John Brown, Scott, Swan Hunter, Fairfield, and Cammell Laird. Vickers-Armstrongs and Cammell Laird are virtually the same, Cammell Laird's interest being taken care of by the Vickers-Armstrongs Company. They are two separate entities but really under one control. The others are, so far as we know, independent. They have, of course, points of contact; they are members of the Shipbuilders Security Company. The Fairfield Shipbuilding Company we really know very little about. So far as the resources available to us go, we have looked up the returns in Somerset House, and we find that the company is controlled by a company called the Shipbuilders' Investment Company. When we look up to examine the shareholders of the Shipbuilders' Investment Company, we find that the controlling block of shares are in the hands of various individuals all described as "Esquires" and they all have this in common, that they are clerks in the well-known banking house of Kleinwort; but we really have not the least idea who owns those shares.

Then we deal under *Marine Engineering* with the smaller naval firms, the other naval firms, and I do not think I should serve any useful purpose by calling your attention to any further point. I think we have set out there what the position is.

Then I come to explosives, and I am going to call a chemist who will be able to answer any general chemical questions which I think the Commission may desire to ask. I have no doubt that all the facts that are set out and all the chemical names are completely familiar to every person in this room except myself. I do not propose to air my ignorance by going through these words, or even trying to pronounce a great many of these names. The witness, I understand, will make these suggestions to you. The chemical industry, unlike the industry we have been discussing, heavy arms, is very largely, and indeed mainly, concerned with perfectly pacific commercial purposes. It touches the realm of arms only in two places, and perhaps a third rather incidentally. It touches it in regard to explosives and it touches it in regard to poison gases. It touches it in the third place in that it so happens that Imperial Chemical Industries, having taken over what used to be in my young days Kynochs, are concerned and do carry on a pretty thriving business in these days in supplying small arms ammunition; but that is a mere accident, of course, that it happens to be this company.

The I.C.I. is a Company which the writer of this piece of evidence does not, as you will observe, criticise. He believes it to be run and founded on modern and up-to-date lines, and to be well and efficiently run. The company, however, has very large ramifications, enormous ramifications, in this country, and even more striking international ramifications than Vickers-Armstrongs. For instance, it is obvious from the document we have got in the American Inquiry that they have selling arrangements with Du Pont de Nemours of America, they have arrangements with I. G. Farbenindustrie of Germany; and we particularly ask you in the course of the evidence which you take to see that all these agreements are forthcoming, in order that we may find out exactly what the extent of the matter is. In so far as it deals with armaments at all, its concern, of course, is to sell explosives, and for the reasons I have given, small arms, and one wonders— one has no information to-day—about poison gas.

One of the very unsatisfactory features of the present system, if I understand the law right, is that the licensing system which we have got at the present time does not extend to poison gases. At any rate, it is possible to export chemicals which, when mixed with some other chemical, may form a most deadly gas, which can only be used for military purposes.

Our suggestion with regard to the chemical industry is this. So far as explosives are concerned, it

* Appendix p. 176.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

would be, for technical reasons, impossible to isolate the explosive which is required for military purposes, and that which is required for pacific purposes, for instance, for the work of blasting. We understand that 60 per cent. of the output is used for military purposes. We suggest that the state should take over the explosive industry as a whole. It would not be the least difficult to do so. It is already isolated as a separate department, the explosives department of this company, and I believe the factories in which the explosives are made extend to various portions of the country and are not congregated in one area, but extend right down from Cumberland to Cornwall. There is no technical difficulty in taking over the explosives industry, apart from the rest of the chemical business of the company, if it is desired to do so.

However, when you come to poison gas, you come to a rather more difficult position, because, of course, the component parts of poison gases may be used, or are used largely, for quite legitimate commercial purposes. For instance—I speak as a child in these matters—I think I have been told that the ordinary chlorine which is used for commercial bleaching is a component part of one of these poison gases. For some of these poison gases we suggest that the manufacture be absolutely prohibited, that is to say, of course, without some express governmental sanction, and that the export of them be absolutely prohibited. We do not desire that these deadly gases should be exported from this country either under licence or without licence. We desire that the export of these deadly poison gases be absolutely prohibited, and that the manufacture of these poison gases be most rigorously controlled by the government department concerned. That, of course, is the alternative to the solution which, for wholly other reasons, for general reasons of policy, would commend itself to the Union for whom I am appearing, namely, to take over for the state at a fair price, compensating and so on, the whole of the industry. That is the conclusion we have come to and the conclusion which we desire to suggest to you about that.

Then that brings me to say a word or two about aircraft, and that you will find is in Chapter 4, of Part IV*. Some of this I might perhaps read to you, because I think in the long run it will save time. We start off with a quotation from the *Manchester Guardian* which I think our evidence fully justifies:

"The aviation industry has now become an armaments trade and little else. Up to this year it was producing in England only a few hundred civil planes a year. Its main work has always been predominantly military. Most of the 234 machines and 409 engines it exported in 1933 (the last year for which we have a record) were destined for military service. Now, under our new programme, the military function becomes overwhelmingly the chief one. More new military aeroplanes (1,500) are actually to be produced this year than the whole of the civil fleet at the present in existence—1,200 aeroplanes, a figure which includes sport and pleasure craft of all ages and sizes. The manufacturing side of the air industry thus becomes little but an enormous war arsenal."

Now, you will find, Sir John, the relative figures given for the Royal Air Force, the export trade, and the home civil. Of a total of £8,000,000, the Royal Air Force takes £6,000,000 of the £8,000,000, the export trade £1.5 million, and the home civil £0.5 million. I am unable to specify what proportion of the 1.5, the export, are civil aeroplanes and what are military, but for the reasons I have given it would be fair, I think, to assume that the very great majority of the £1.5 millions exported would be military machines and not civil machines, and only a negligible quantity, I think, would be civil.

Now, of course, the air industry is peculiar in that it has grown up, and there is nothing at all corresponding to a naval dockyard, or Woolwich Arsenal, such as would enable us to have any check on the sort of prices which various aeroplane manufacturers charge. The matter, as you all know, is to be adjusted and dealt with so far as possible by a costing system, and everybody knows how valuable a costing system may be; but if the organisation is ineffective and wrong, of course not even a costing system will save it.

We suggest that the organisation is wrong, and for the reasons here given. May I call your attention to a passage in Chapter 4 of Part IV, under the heading *Research and Technical Development*, the second paragraph:

"The experimental work is done about half and half (in cost) by the private industry and by public service. The industry builds all experimental aeroplanes and engines, mostly at public expense. This work is naturally less profitable than production orders. For the smaller classes of war planes it is usual to have competitive models built to a common specification by a number of contractors. The fortunes of firms swing to and fro with their success or failure in these competitions."

Then, dealing with the defects of the present system in Part VIII, the writer of this evidence, whom I shall call before you, says this:†

"*Military and Civil Aviation.* The industry is of a type and at a stage of development where the problems of nationalisation are fewer than in the heavy armaments industry, for example. The factories are all purely aeronautical and they are mainly dependent on government orders excepting de Havilland and the very small firms. The problem of civil aircraft, however, and their convertibility to military aircraft raises special issues for the aircraft industry. The production of civil and military aircraft might well be separated, but in our opinion the case for abolition of private trade extends to the civil as well as the military section. The problem of adaptability raises vital problems from the international point of view and more particularly would seem to indicate the doubtfulness of any solution of the problem independently of a scheme for the international control of aviation."

So you will see we suggest taking over the whole industry, civil and military, the civil side being a small part.

1063. *Chairman:* When he says "independently of a scheme for the international control of aviation," does he mean that if there is such an international scheme, his suggestion might not be necessary?

Sir William Jowitt: It might not then be necessary to take over the civil; but the problem of adaptability is such that unless you get something of that sort it is so very difficult to draw the line.

Then under the heading of *Research and Technical Development* he suggests this—and here the witness who writes this, and whom I am calling, speaks about what he knows; he was head until recently of the Aero-Dynamics Department at Farnborough, so he can speak with authority on this matter—

"It is suggested that two distinct research organisations are required. One should serve the particular purpose of air force development, and the other would conduct general and fundamental research and aim at the development of commercial and civil aviation. While the first organisation would not normally publish its results, all investigations by the latter must be fully published and their laboratories and experimental plants open to inspection at any

* Appendix p. 192.

† Appendix p. 212.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

time. Close contact with both designer and user is essential. It is suggested that some method of organisation is desirable which would bring together, in deciding on technical policy, the Air Staff and the chiefs of design, production and research, for any scheme to be successful. It must be based on the proper co-ordination of knowledge and ideas in the fields of research, design, production and operation. It is this co-ordination which is defective at the moment, as it must be when the work is divided amongst the parts of a competitive private trade and a public service. Under the present system, trade jealousy inevitably prevents the component firms of the industry from sharing ideas and discoveries the combination of which, at any moment, might lead to the best available solution of the problem in hand. The Ministry and its great technical staffs are gravely handicapped in providing such co-ordination, for they labour always under the disadvantage of being prohibited from free communication in the interests of 'fair' competition. This position would be greatly simplified by the necessity of complete publication."

Then he goes on, and he says that aircraft design is empirical, and progress calls for a vast amount of experiment; and then he says at the top of the next page:—

"The experimental work of the industry, on the other hand, is almost entirely confined to the design and construction of aeroplanes and engines. *Ad hoc* experimenting, of which there is already too little done, cannot be undertaken by the private industry, and in any case, the conditions of service in a small firm would not conduce to this work being well done. The problem of designing staff must be considered in this connection. A result of the large number of independent units in the industry in relation to the volume of work is a relative poverty in each designing staff. Not only do the firms not specialise as they might each on its own type of aeroplane, but they are unable to set their best men to specialise on parts of a type or particular aspects of a design. In the result, good general conceptions may fall from inadequate attention to detail or good detail be lost in poor general conceptions. More effective drawing offices could be built up in the bigger (because fewer) units made possible if the industry were nationalised."

That, Sir John, is the view of the matter which this witness will put before you. You must have constant connection between the man who sits down at the model and thinks, and the man who is carrying out his thoughts and putting them into practice.

The conclusion of the whole matter, subject to the next point which I have got to consider, which is the licensing system—I must say something about that—is brought out on the last page. I do not mean merely the conclusion of the aircraft, but of the whole matter. This, with your permission, I should like to read. I am reading from the right-hand column at the end:—

"Conclusion: In summing up this Part VIII certain basic schemes have been outlined for the guidance of the Royal Commission in considering the problem of practicability. If a British Government wishes to have an armaments industry free from the inefficiency and abuses inherent in private manufacture, they can have it by taking over the industry, but the detailed methods are for the Commission or the Government to provide, although the Union of Democratic Control would find no difficulty in presenting such a scheme if they felt that it was their function to do so. Since the Royal Commission may not see its way to accept these views, the Union of Democratic Control in order to assist it in its work has put forward certain modified systems of control which have been worked out in consultation with technical experts."

I may say that under the heading "Control" my clients would certainly ask you to consider what has been suggested in the American Inquiry by a member of the arms trade itself, namely, that at least it would be legitimate that the Government should put this armaments industry under that measure of control which, as in the case of a public utility company, limits its profit, as in the case of a gas company or anything of that sort.

"The approach may be summarised as follows:—

(1) *Nationalisation of the Arms Industry.*

- (a) Heavy Arms.
- (b) Chemicals and Explosives.
- (c) Aircraft.

Such nationalisation would have to be supplemented by control of the sources of raw materials, e.g., iron, nickel, etc."

Of course, by that is meant this. Obviously the arms industry to-day, in so far as it is relying for its raw materials on Swedish ore, for instance, is dependent upon the possibility of ore coming from Sweden, and for that purpose it makes arrangements now amongst its members for that purpose. Any government taking over must of course take steps to see that it is not at a critical moment going to be deprived of its requisite ore. That applies just as much to a private industry to-day as it would to the Government.

(2) *Nationalisation of the Armaments Sections of the Respective Industries.*

The problem of separation of the production and process from normal industrial work has been dealt with and it has been shown that the technical problems involved can be overcome.

(3) *Control through Licensing, Inspection and Publicity.*

If the industry is still left in private hands, it is possible to increase control by the following means:—

- (a) Improvement in the licensing system already specified in Part VII."

That I am going to come to in a moment. There are several bad gaps, as we see it, in the licensing system to-day.

(b) Financial inspection and control.

(c) Separation of the financial arrangements for war and civil research with full publicity.

(d) Inspection and control internally by democratically elected workers in the firms concerned.

(e) International inspection and control.

"In the above evidence the Union of Democratic Control has emphasised the inefficiency of the present system of private manufacture and the various abuses that attend it. It has been shown by Dr. Addison to be totally inadequate in time of emergency. The evidence of corruption and irresponsibility brought against the armament rings has never been rebutted. The system which closely connects the arms trade with the public service, while avoiding the salutary sanctions of public control, is contrary to every principle of responsible government. It gives rise to suspicion of evil even when evil may not be present and it makes it only too possible for interested parties to promote their interests in a way which increases national antagonisms and fosters the armament race which is admittedly one of the contributory factors leading to war."

We do not want to overstate the matter. We have never stated, and we do not believe now, that the fact that the arms trade—that there is an export trade in arms—is the principal cause of war, or anything of the sort. We believe that in a very difficult situation it is a factor which makes the likelihood of war greater, and we think that the mere inducement to other countries to buy arms, necessitating that their neighbours correspondingly buy arms, and when everybody gets arms, and one gets frightened of the other, is a contributory cause which may lead to lighting the spark which may cause the conflagration which burns down the house.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

It remains for me to say something about the licensing system, and to show you how that is inadequate.

(After a short adjournment.)

1064. *Chairman*: Sir William, I have had an opportunity of reading that letter now, and, if you press it, strictly speaking I think it is admissible within the terms of my ruling; but at the same time it is the sort of letter I would sooner not hear. But still, you must exercise your own mind about it.

Sir William Jowitt: Sir John, I should like to be guided by you, if I may say so. I do not want to stand on my strict rights. As you have indicated that, if you think it better that I should not—

1065. *Chairman*: If I must rule, I must rule in accordance with the principle that I laid down; and under the conditions of that principle it is admissible.

Sir William Jowitt: Well, Sir John, having regard to what you have said, I shall not press it.

1066. *Chairman*: I am obliged to you, and to those who instruct you.

Sir William Jowitt: Now, Sir John, I had left myself the matter of licensing to deal with. I do not suppose I can help you very much, because to you and to Professor Gutteridge, at any rate, the law on the topic is easily available. It depends, of course, so far as the law is concerned, upon the Customs and Inland Revenue Act, 1879, Section 8, the Exportation of Arms Act, 1900, and the Finance Act, 1921, Section 17; and the Order in Council which I think you want is the Arms Export Prohibition Order of 1931. I have a copy of it, but it will, of course, be available to you; it is 1931, No. 413.

1067. *Professor Gutteridge*: That is the S.R. & O. reference?

Sir William Jowitt: Yes; and then, of course, the Board of Trade publish a list every year, as you know, advising people for what commodities licences are required, and specifying the general licences in force.

I speak subject to correction, but it seems to me that the position is this. For arms of all sorts a licence is required; for explosives a licence is required; but for poison gas there is no statutory requirement for a licence for export at all. The only possible exception is this, if you bring it under Heading XVII of the Order in Council, which is in these words: "Appliances for use with arms and apparatus exclusively designed and intended for land, sea or aerial warfare."

1068. *Professor Gutteridge*: There was a case, I think, in which pyrogallic acid was dealt with. I think that was the case of *Attorney-General v. Brown*. I think that included pyrogallic acid.

Secretary: That was before this Order was in force, I think.

Professor Gutteridge: Yes, that may have been under an earlier Order.

Sir William Jowitt: It may have been under one of the Defence of the Realm Regulations. But I think if you look at the Order you will find that the only possible statutory prohibition is under these words: "Appliances for use with arms or apparatus exclusively designed and intended for land, sea or aerial warfare." Now I should not myself think it does, but it is a matter for you to consider as to whether poison gas would come within that category at all. It is hardly an appliance for use with arms or apparatus, and at any rate you will consider whether or not there is any prohibition at all in regard to the exportation of poison gas. The difficulty, of course, arises that you may have poison gas which is all ready for use as such, or you may have what the chemical descriptions in this case show, poison gases of this sort; you may have a commodity which merely needs some other substance mixed with it to make a poison gas; and that would

have to be covered by the licensing system, there is no doubt.

1069. *Mr. Spender*: Do you suggest that it is being exported?

Sir William Jowitt: I have no knowledge one way or the other. I have no reason for supposing the answer is "Yes," and no reason for supposing the answer is "No"; it is quite outside my case. It is a matter you might think it proper to ask questions about from those who can answer. We cannot.

The position with regard to licensing of aircraft is this. There has been in force for some time what is called a general licence for aircraft; that is to say, you can without permission export aircraft to any country, save one country, and that one exception is Abyssinia. You may export aircraft to Italy, for example, but not to Abyssinia unless you get a special *ad hoc* licence to deal with it.

We suggest that certainly the existing licensing system should be amended so as to include these chemicals of the nature I have indicated, in any event. As to the rest, our objection and our case against the inadequacy of the licensing system is this. First of all, we object very strongly to the complete absence of publicity. We believe that the more public these things are made, the better. There is no publicity; the names of the applicants are never divulged. It is the well-understood Parliamentary practice, and you will see set out in the first page of Part VII* of our case the answer which Mr. Runciman made, I was going to say quite recently, but I see it was on 7th June, 1932; but it certainly applies to-day: "It has never been the custom to give these particulars, and it is undesirable to do so." We do know, and the facts are shown on that page, that in one year 415 licences were granted, and only seven licences were refused. I suggest that the licensing system is very inadequate, and may very easily be dodged by anybody who is minded to do it.

As an illustration of that, may I ask you to look at Part 3 of the American evidence, at page 680. There is a letter which says this in connection with a consignment of guns to Bolivia, and where it was suggested that under the existing circumstances there would be a difficulty in sending to Bolivia. This is a letter from Mr. John Ball, of the Solely Armament Company, at the top of page 680: "We have, of course, heard from several sources that Bolivia wants A.A. guns quickly"—that is no doubt anti-aircraft guns—"but we do not think for a moment that a shipment or sale to Bolivia could be made direct"—the word "direct" is in italics—"while that country is at war. If, however, an American armament firm of some standing bought the guns, for eventual resale, things might be easier—or if the Columbian Government, who are not at war, bought the guns, they could no doubt have them."

Then in Volume 5 there is another indication of the same thing at page 1337. On June 11th, 1934, the Du Pont de Nemours Company wrote to Imperial Chemical Industries with regard to an inquiry for explosives: "Although the inquiry distinctly states that prices are wanted c.i.f. Montevideo, we suspect that the material is for Paraguay and since we wish to co-operate with our government in observing the embargo, we deemed it best not to quote." So that either by a device, if you have an order, you can use one of your foreign subsidiaries situate in another country which is not subject to the embargo, or you can very easily send your goods to the neighbouring country, and that neighbouring country can send those goods over the border; and you will find here very interesting confirmation of that. I have, and I think the Commissioners have, figures for the amount of arms and stores exported from Great Britain, and I have taken out the four countries which during the Disarmament Conference have been at war, China and Japan, and Bolivia and Paraguay.

* Appendix p. 203.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

1070. *Chairman*: Where are you in fact taking those figures from?

Sir William Jowitt: These are official Board of Trade figures. To China in 1929 the exports were £32,700, and by 1933, the last figure I have got, they have gone up to £223,514. The figures for Japan in 1929 were £129,696, and in 1933 £185,871. It seems that our largest export to Japan went in 1932, because we went up there to £321,701. In Bolivia in these years we were down as low as £26,466, but in 1933 we moved up to £331,606; and in Paraguay, in the course of these five years we were as low as £437 in 1929, and we moved up in 1933 to £87,486.

There is not a shadow of doubt that quantities of military ammunition exported from Great Britain have vastly increased. If you take the number of cartridges, we did not export any in 1929, 1930 or 1931; but in 1932 we exported 500,000, and in 1933 we exported 15,850,000 loaded cartridges. That is to Paraguay. To China we exported in 1929 as low as 393,000, and in 1933 it has risen to 33,202,500. So that it is obvious that we are exporting very large quantities to those countries, and if you ask, as you no doubt will do, for another Board of Trade document, a Consular Report, you will find this statement in Document 27234 of 1932, dealing with Paraguay's foreign trade for the first six months of 1933. After setting out the figures it says: "It is unlikely that any war material is included in this total, as these are frequently brought into the country secretly, being landed at various places along the river, and have not consequently passed through the Customs House."

So that in considering the official Paraguay returns you must remember that these things as a rule do not pass through the Customs House in the ordinary way, and the fact remains that it appears that that is an illustration of the way that goods may come into Paraguay, although they are consigned, let us say quite honestly, to a purchaser in Montevideo or Uruguay who makes arrangements to run the guns through, or pass them through, to Paraguay.

The fact remains that we in this country have been supplying arms to China and Japan, and to Paraguay and Bolivia; and we suggest to this Commission as forcibly as we can that this is a class of business or trade, whether it brings in profits or does not, from which we desire to be dissociated, and we suggest that the vast majority of people in this country will have no sort of use for making money by supplying munitions of war to people on both sides in this particular sort of conflict.

We further suggest that the licensing system is inadequate and ineffective in that it applies too late. In dealing with ships, for instance, as I have already pointed out, by reason of the nature of the thing it is obvious that no firm can start building a ship without the approval of our government. On the other hand, any firm can start building a fleet of tanks, or of howitzers, or what you will, without asking the government at all, and then, of course, have only to go to the government to get the licence for export. It would be very much better if, before any one of the firms in this country built a single thing for a foreign government, it should be done, as we suggest it should be done, with the full knowledge and full approval of the government; and, we hope, with full publicity.

We make recommendations on this point at the end of Part VII*.

"To summarise our criticism of the present system of licensing:—(1) It does not cover the export of aeroplanes."—I have explained that what we mean by that is not that the licensing system does not apply, but that by reason of the general licence which has been given for all countries excepting Abyssinia, it has been rendered virtually inoperative.—(2) It does not cover the export of chemical substances which are of military use only and certain elements required for the manufacture of explosives. (3) Information is only published after the

arms have left British ports. (4) Information is inadequate. It does not give the name of the firms involved. It does not give particulars of cases where permits for licences are refused. It does not cover manufacture nor the essential inspection which should accompany manufacture. (5) It does not prevent British firms manufacturing or finishing arms abroad and thus avoiding the licensing system. (6) It does not cover the preliminary unofficial inquiries made by prospective applicants."

Then we add: "Assuming the trade in arms"—and we suggest this whether the government takes over the trade in arms or not—"Assuming the trade in arms, the following are essential reforms, but it must be stated that only the prohibition of the export of arms and munitions would remove the abuses inherent in such traffic:—(1) Publication of licences. (2) Publicity for orders from state and private works. (3) Publicity for purchase by home and foreign governments. (4) Licences to manufacture and full publicity for such manufacture. The suggestions for such proposals made during February, 1935, were supported by all nations except Great Britain, Italy and Japan."

1071. *Chairman*: May I ask just one question here. The four recommendations that you have just read out do not touch No. (5) of the objections, do they?

Sir William Jowitt: No. You could not, as we say, unless you prohibit the export altogether, and therefore I do not think you need deal with No. (5) unless you took over the trade.

1072. *Mr. Spender*: What suggestion are you referring to?

Sir William Jowitt: That on the last page of Part VII, on the right hand side, under *Conclusion*.

1073. *Mr. Spender*: I have the reference there, but I wanted to know a little more specifically when were these suggestions made, and when were they turned down by our government.

Sir William Jowitt: In February, 1935.

1074. *Mr. Spender*: Where—at Geneva?

Sir William Jowitt: At the Disarmament Conference.

1075. *Dame Rachel Crowdy*: I should like, if I may, to go back to something which you mentioned a few moments ago. You mentioned that aircraft was exempt from licences except in the case of Abyssinia. I think I am right in remembering that it is nothing to do with the international situation, but it is part of the treaty, the old treaty, to which Italy, France and England were parties?

Sir William Jowitt: That is my recollection.

1076. *Dame Rachel Crowdy*: It is nothing to do with the international situation, and one should have that in one's mind?

Sir William Jowitt: That is so.

That represents the case I have to put before you. May I just conclude with a consideration of this sort. We are only too conscious of the fact that the case we have represented to you is incomplete. We have not been able to present a case with that full wealth of detail which we should have liked. The case which I have had the honour of presenting to you with regard to the heavy arms industry, we have had—when I say "we" I mean my clients have had, because I have had no part in the preparation of this document—we have had the collaboration of a number of young and intelligent people who are concerned in the trade. For reasons I have indicated, I cannot call any of them before you. In dealing with the chemical trade, similarly we have had, and I myself have seen, a number of equally young and equally intelligent people who are concerned in the chemical trade. Those gentlemen I cannot call before you for reasons which you will readily appreciate. They are commercial chemists. The best I can do, therefore, is to call before you a gentleman who has the technical and educational qualifications of a chemist, who is a chemist, but who does not pretend to be an industrial chemist. In regard to the aircraft point of view, I can call

* Appendix p. 205.

17 July, 1935.]

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C.

[Continued.]

before you Mr. McKinnon Wood, who was very recently head of the Aero-Dynamics Department at Farnborough, and he will be able to tell you the sort of difficulties that he came up against in the course of his work. But we have come here, and I can say quite sincerely that we have thought it right so far as we can to get the material, to put before the Commission every fact which we have been able to ascertain. We offer those facts up to this Commission, thoroughly conscious that it is a wholly uncompleted story; but it is as far as we have been able to go. We have suggested to you—and I feel that the responsibility is yours, and not ours; we have come to assist as far as we can—on the first two pages of the case we put before you, a large number of documents which we humbly submit that you may, in the course of your consideration of this matter, think proper to call for. We have indicated, on the second page, a considerable number of witnesses who we think could throw considerable light upon this matter, and in view of our criticisms of the works lay-out of the heavy steel trade—criticism which, you appreciate, I do not apply at all to the chemical trade—we have thought it right to suggest that this Commission should undertake an inspection of the works. I say I would do that if I was in your position, but I say frankly it would

mean little to me, because I have not sufficient technical knowledge; but you might think it advisable to appoint some government official who does understand these things, to go round and report as to how far there is any foundation in our case. For the rest we suggest that we have at least made out a case which necessitates, in the public interest, and to satisfy public requirements, the most stringent and complete investigation—investigation which we cannot make, which we have not the material to make—and we ask you to say that before this Commission reports, this investigation should be made in the most thorough and complete manner, in order to see what does come out.

I will call my evidence quite shortly. With regard to the heavy steel industry—as I say, I cannot answer any questions myself, because I have no knowledge of the matter—I can very easily get for you by to-morrow morning any information which you think would be of use to you in conducting this Inquiry.

1077. *Chairman:* We think that the most convenient course would be that you should call your witnesses, that any questions that anyone may desire to put to them should be put, and then at the end of the examination of the witnesses we will put any questions that we desire to ask.

Sir William Jowitt: I am much obliged.

Mr. RONALD McKINNON WOOD, O.B.E., M.A., F.R.Ae.S., called and examined.

1078. *Mr. McKinnon Wood:* My name is Ronald McKinnon Wood. I was employed in the Royal Air Force establishment from 1914 to 1934, in the Air Ministry's Research Department at Farnborough. I have seen the aircraft industry, chiefly on the side of the development of new aeroplanes for the Air Force. I was Head of the Aero-Dynamics Research Department there from 1919. The first point I want to emphasise is that the new model which is submitted bearing the name of some aircraft firm for testing by the Air Force is by no means the product of private industry; it is the product in proportions of 50-50 of state research and private enterprise in design. The aeroplane firm's designing office is working on the basis of an immense amount of research and experimental work conducted by the Air Ministry and the Department of Scientific and Industrial Research. The aeroplane is designed under close supervision from the Air Ministry to a fairly elaborate specification, so that the industry is working a great deal with state assistance and under very close supervision.

One has, to my mind, a rather large number of competing drawing offices, and I have felt for a long time that the industry would be improved by a reduction of the number of units. I have been given to understand that the reason for the Air Ministry's policy in maintaining so many firms was for expansion in time of war. I am quite unable to see that having a large number of designing and manufacturing units—that is to say, having a scattered industry—is of any assistance towards expansion in time of war. It seems to me that the essential thing for rapid expansion is a centralised control. The result of that large number of units is that it is impossible for any one unit to have a designing staff of the best strength, that the more units there are, the weaker must be the designing strength of each unit; it becomes impossible to put first-class men on to specialisation on particular lines. But that is really a question of rationalisation rather than nationalisation. The effect of having a number of firms competing in design is that if any new idea arises in any one firm it will ultimately, no doubt, come out for general use, but it is a trade secret at the moment. Very often the ideas that originate in firms are complementary ideas and the best results are obtained by getting them as quickly as possible together. Very often they are ideas of universal application and, therefore, they ought to be applied at once to achieve the greatest rate of progress. I often found myself in the difficult position—acting as one does in the

government research service, to a very large extent, as a free consulting engineer to the aeroplane designer—in the difficulty that I was unable to bring these complementary ideas together, in the interest of fair competition between rivals who were competing in business to a common specification.

If you take the history of the aeroplane engine, you can trace the development of the different aircraft engine firms and you find that they began very much in the Royal Aircraft Establishment. Sir William this morning referred to Mr. Green taking drawings with him from the Aircraft Establishment at a time when designing at the Establishment was stopped—that was, I think, in 1917, during the War. The Armstrong-Siddeley engine sprang out of the work that was first done at Farnborough. The same with the Bristol Aeroplane Company's engines; they developed not out of engines, but out of cylinders (which is the main part of the engines) that were developed at Farnborough. All along the line one has this co-operation and the basic work is done in the state institution; so that the new model is produced partly by the state and partly by private enterprise, but with these disadvantages that I have been indicating. Incidentally, there are aeroplane weekly papers, one of which has been particularly venomous in its attacks on the Air Ministry and the Aircraft Establishment during the last 20 years, which does not tend to promote that harmony of feeling between all the people who are engaged in what is really a common enterprise. I simply mention it because, if there were no private trade, I think that trade paper would undoubtedly disappear.

1079. *Sir Philip Gibbs:* Might we have the name of that paper?

Mr. McKinnon Wood: The *Aeroplane*. Another important question is that of secrecy, on which a great deal of stress was laid by the committee which inquired into the future of Woolwich Arsenal and reported about 1918 or 1919. Secrecy can obviously be much better maintained in a government service than it can when private enterprise is coming in, and the test pilot—I have no accusations to make against anybody, I merely wish to point out where leakages may occur under the system—of the British aircraft firm visits the Air Force testing station; at the same time he is the salesman of the firm to foreign governments. As a corollary of the need for maintaining secrecy, it often has the result that the designer is denied information that

17th July, 1935.]

Mr. RONALD MCKINNON WOOD, O.B.E., M.A., F.R.Ae.S.

[Continued.]

would be very helpful to him in his work. I remember one case in which experiments had been carried out upon a model to find the flow of air over the deck of an aircraft carrier, for the guidance of the Admiralty in designing the ship, and the Admiralty refused to allow that information to be communicated to the designers of aeroplanes which had to alight on the deck. It is quite possible that that information might have been made use of by the designers of aeroplanes. That illustrates the difficulty that is bound to arise occasionally in regard to secrecy.

Sir William was reading evidence which pointed out that the fortunes of firms swing to and fro with their success in design competitions, that the orders for the reproduction of designs in quantity naturally go, at any rate in the first place, to the firm that designed the aeroplane which was successful in the competition. I suggest that if you have an industry in which the demand fluctuates a great deal from firm to firm, where one firm has most orders one year and another firm most orders another year, it must be uneconomical in production. At the same time, there are other objections. We have no real competition in the case of producing large numbers of aeroplanes because the order for the large number goes to the firm that designs the aeroplanes. There are, obviously, very strong reasons for that being so. There is no state production as there was during the War, to provide a check on the costs. Designing and producing at the state factory was stopped, as I said, in 1917, and I have little doubt that it was stopped as the result of the pressure that was brought to bear by the rising aircraft industry, which resented the factory setting itself up as an adviser and a supervisor of the work of the industry and a competitor at the same time. And I rather think it was felt that it was unfair competition because the state factory had access to the very latest experimental results. If that is so, it is an interesting commentary upon the claim that private enterprise is more efficient than state factories. Anyway, the factory was closed down as a designing and producing factory and remained as an experimental establishment. The attack that was made in the Press and in Parliament on the factory was an attack on the ground of the inefficiency of its drawing office staff. But the superintendent, the engineer in charge of designing and the heads of sections of the drawing office were promptly absorbed in good posts in the industry—which rather seems to counter that statement.

With regard to exports, I think it is claimed that the export of aircraft helps our aircraft industry to equip our Air Force fully, for a number of reasons, one of which is that you get the stimulus of competition. I think there is nothing in that at all because it is quite clear that the military aircraft that are exported are exported to the governments of the smaller powers and they will only take the aircraft because they have been accepted for our Air Force. So that this export trade leads to no new production and cannot, therefore, lead to stimulation in design. The chairman of one of our aircraft firms said that those aeroplanes that are exported are all ones that have been approved for the British Air Force and they are always about five years out of date.

Again, it is claimed that it reduces the cost of production. Actually, it amounts to an increase in output of something like 20 or 25 per cent. You cannot make an appreciable reduction, due to increased output, in the costs of production unless you are dealing with something that is very much bigger than that.

Another argument is that it allows room for expansion, that in the event of an emergency the export production can be switched over to meet the demands of our government. That gives you an expansion of 20 or 25 per cent. What would be required of course, in a serious war would

be hundreds per cent. So that the argument that the export trade helps the equipment of our Air Force seems to come down chiefly to that small amount of expansion.

With regard to the difficulty of nationalising the industry: We have an industry here which has very little connection with other industries. It has certain connections with the motor car trade, but all the factories producing aircraft or aircraft engines are quite distinct, and the complication that appears to arise is the difficulty of separating the military production and the civil production. I think there is no doubt about it that if there are serious objections to an export trade in military aircraft, there are also serious objections to an export trade in civil aircraft. The civil aeroplane is an article for which the world has, as yet, a very small demand, but it is immediately useful for military purposes. It depends upon the kind of warfare that one contemplates. The civil aeroplane would be no use as a fighting aeroplane. It would be no use for various purposes for which our military aeroplanes are built; but for indiscriminate bombing of centres of civil population—which is the kind of warfare which is advocated by a number of eminent air authorities as the right use of the air weapon, however beastly we may think it—the civil aeroplane would be immediately useful and civil aeroplanes can be built for quick conversion to military aeroplanes, the particular item that has to be provided for being the provision of places for gunners. With regard to the separation of civil aircraft, we have one big aircraft factory, de Havillands, which we can say is purely a civil factory and the small firms are almost entirely concerned with civil work. If it were desired to make a separation, the main difficulty in separating them would be the provision of air liners for Imperial Airways, they having been mostly built by firms concerned with armaments—Short, Armstrong-Whitworth, Handley Page. I personally would favour the nationalisation of the whole aircraft industry and the subsequent separation of the civil from the military production.

One further point: I would like to draw attention to the fact that under the present system, in my opinion, quite important military material in regard to aircraft has been passing to Germany. Among the aero engines that have been passing there have been super-charged aero engines. An aeroplane engine may be used either for civil or military purposes, but in general there is a difference between the civil and the military engine, and the super-charged engine is something which has required a tremendous amount of work to bring it to its present stage. It is the product of something like 15 to 20 years of research and experiment. It is possible that in these exports of aero engines to Germany a good deal of assistance in the way of information about the super-charging has gone with the engine. The firm of Smith's Accessories has exported to the German government enough ignition screens for 3,000 aeroplanes.

1080. *Sir William Jowitt*: What are ignition screens?

Mr. McKinnon Wood: They are screens for protecting the wireless in the aeroplane from interference from the magnetos.

1081. *Chairman*: You have given reasons why, in your opinion, the present system hampers, if I may use that expression, the proper rate and extent of development. That is so, is it not?

Mr. McKinnon Wood: Yes, Sir.

1082. *Chairman*: In spite of that, the development in design and development generally of the engine and so forth, has been remarkable and extensive in this country, has it not, even under the present system?

Mr. McKinnon Wood: Yes, Sir John; the development has been remarkable, but I do not see that

17 July, 1935.]

Mr. RONALD MCKINNON WOOD, O.B.E., M.A., F.R.Ae.S.

[Continued.]

we have any standard to enable us to say how much greater it might have been.

1083. *Chairman*: True! Of course, one might say it ought to have been more; but it has been great?

Mr. McKinnon Wood: Yes. It might have been achieved more economically.

1084. *Chairman*: I do not understand your reference to the export market. On the last page but one of your statement, at the bottom of the right-hand column, under the heading *The Export Trade*, it says "There remains the problem of the export market, which is almost entirely confined to military aircraft." Do you see that?

Mr. McKinnon Wood: Yes.

1085. *Chairman*: That is not the fact, is it? Is there not a very large trade in the export of civil aircraft?

Mr. McKinnon Wood: Unfortunately, the figures that are given do not discriminate between the military and the civil, and I am speaking simply from my impressions, that the export trade would be mainly military.

1086. *Chairman*: Is the whole of the export trade in reference to aeroplanes confined to complete machines? Is there not a considerable export trade of engines or of parts of engines and so forth?

Mr. McKinnon Wood: The figures are given at the end of Part IV*. There are three columns—the first is complete aeroplanes, the second is engines and the third is spares.

1087. *Chairman*: Yes. That table of exports of aeroplanes is not confined to military aeroplanes, is it, or military engines?

Mr. McKinnon Wood: No, Sir.

1088. *Chairman*: It is hardly accurate to say, is it, as you do in Part VIII, that the export trade is almost entirely confined to military aircraft?

Mr. McKinnon Wood: I cannot produce any evidence to support that statement, Sir.

1089. *Chairman*: On the last page of the statement of evidence, under head (5), it is recommended "That the export trade, which in any case is not desirable, is not such as to present any special difficulty." Assuming that the trade in aeroplanes can be nationalised, then if there was any export at all it would be export by the government?

Mr. McKinnon Wood: Yes.

1090. *Chairman*: They would be the traders if they chose to be.

Mr. McKinnon Wood: Yes.

1091. *Chairman*: Supposing the trade is not nationalised, is there not a very substantial trade in civil aeroplanes which can hardly be said to present no special difficulties? Are you suggesting here that the export trade in civil aeroplanes or engines for civil aeroplanes should be forbidden? It seems to me to present a great many difficulties.

Mr. McKinnon Wood: It would then be a government trade in civil aeroplanes.

1092. *Chairman*: If it was nationalised; but supposing it is not nationalised and you are merely trying to indicate, as you do in this particular part of your case, how it may be controlled if it was not nationalised, there would be very great difficulties, would there not, in dealing with the export of civil aeroplanes and in distinguishing between civil and military aeroplanes or engines? I only want to understand what the proposition is.

1093. *Sir Philip Gibbs*: Have you not already drawn rather a sharp distinction between civil aeroplanes and military aeroplanes? You say there is a distinct difference.

Mr. McKinnon Wood: A 'plane is definitely a civil aeroplane or a military aeroplane when it is produced, but they are sometimes produced in a convertible form.

1094. *Chairman*: And the engine may be used for one purpose or the other.

Mr. McKinnon Wood: The engine may be used for one purpose or the other, but there is a ten-

dency now for the military machine to have the supercharged engine and for the civil machine, which is not required to fly so high, to have an un-supercharged engine.

1095. *Dame Rachel Crowdy*: Is your opinion that any civil aeroplane could be converted into a bombing 'plane but it could not be converted into a fighting 'plane?

Mr. McKinnon Wood: It could be used for bombing. It could be used for flying in the clouds over a city, where it was safe against attack, directed by some navigational means, and dropping bombs rather vaguely on the city. If it is to be made a bombing machine it has to be fitted with gun mountings, which might be almost impossible. So that to make an effective Air Force machine of it would involve a big alteration, but to use it for military purposes you need no alteration at all.

1096. *Mr. Spender*: You contemplate the establishment of a pretty big service, do you not? I should like to put this point to you: It is one that has been running through the whole of this Inquiry. The main criticism made against the private firms is that they lack this and that facility, and especially that they have not the power of expansion. Your evidence seems to imply that the state establishment, or whatever it is, will supply everything that has been found wanting in private firms. It is said on the one hand that there is room for expansion, for the production of a very large number of aeroplanes. We have had it put to us on the other side that there would be great economy, or no increased expenditure, involved in the state taking over the industry.

Mr. McKinnon Wood: In nationalising the industry I contemplate the state taking over the factories and then finding that there was too great a number of them and cutting down the number of factories, so that there would be fewer designing offices. At the same time, having done that, I think you could with great advantage spread the research and experimental services out, keeping some of it centralised but diffusing a good deal of it through the industry, bringing the experimenters into close touch with the designers. Because in designing aeroplanes you want a good deal of experiment conducted during the process of design. With regard to expansion, it is simply a question of having this centralised co-ordinated service, which, I think, would make it easier to expand, and I think the smaller the number of units you had the easier it would be to carry out the work and expand.

1097. *Mr. Spender*: The criticism made against private firms is that they have not made provision for expansion. I am only suggesting to you that the state would have to make that provision and that would involve extra expense.

Mr. McKinnon Wood: The state is more likely to make it than private enterprise.

Mr. Spender: That may be. I am only on the point of costs.

1098. *Sir Kenneth Lee*: Did I understand you to agree that the aeroplanes that have been exported were usually about five years behind the times?

Mr. McKinnon Wood: Military aeroplanes.

1099. *Sir Kenneth Lee*: Then we were not giving much away with a supercharged engine.

Sir William Jovitt: That is a civil engine.

1100. *Sir Kenneth Lee*: I thought the supercharged engine was supposed to be for military purposes.

Mr. McKinnon Wood: What I said referred to aeroplanes and not to engines, but, as I pointed out, it probably applies to engines too. I was quoting the statement of the chairman of an aircraft firm, who said the aeroplanes were always five years out of date.

1101. *Chairman*: He did not mean that literally I suppose, did he?

Mr. McKinnon Wood: He meant the design; it was five years since the design first appeared. It would be a good deal less since the aeroplane first appeared in the Air Force. The supercharged engine represents many years of work. I do not

* Appendix p. 196.

17 July, 1935.]

Mr. RONALD McKINNON WOOD, O.B.E., M.A., F.R.Ae.S.

[Continued.]

think that would be very out-of-date in five years.

1102. *Sir Kenneth Lee*: I think you said that 20 per cent. more or less of output was not very important. Surely if a firm were working only to 80 per cent. of their capacity and could rise to 100 per cent. it would make all the difference in costs, would it not?

Mr. McKinnon Wood: Now you have introduced the level at which the firm are working. It seems to me that you have introduced something extra into the argument. Supposing that a firm is working at 100 per cent. capacity and it builds up a 20 per cent. export trade and therefore increases its work by 20 per cent., there you have the case I am considering. I do not think it is fair to start by assuming that the firm is only working at 80 per cent. of capacity.

1103. *Sir Philip Gibbs*: You say that the design and production of aeroplanes and engines by our state aircraft factory was stopped in 1917. Can you give me the names of any types that were produced by our state aircraft factory?

Mr. McKinnon Wood: It produced the BE2 type, which went overseas with the Expeditionary Force. Then it produced the FE type of aeroplane, with the propeller behind. Then it produced a fast single-seater fighting aeroplane, the SE5, and it produced the RE8 in large numbers.

1104. *Sir Philip Gibbs*: As a matter of fact it did produce most of the types used in the first stages of the War?

Mr. McKinnon Wood: It produced a large part of the equipment and it produced engines which were used in most of those aeroplanes.

1105. *Sir Philip Gibbs*: Have you any idea yourself as to why the government abandoned that production?

Mr. McKinnon Wood: I always attributed it to trade pressure.

1106. *Sir Philip Gibbs*: Could you tell me whether the government handed over the designs of those military aeroplanes to private firms in the course of the War before the production of those types?

Mr. McKinnon Wood: Yes. At the outbreak of war those designs were put out to contract to a number of firms. Some of the aeroplanes were built at the government factory and some by private enterprise.

1107. *Sir Philip Gibbs*: You do not think it was due to better types being designed by private firms in the course of the War?

Mr. McKinnon Wood: My own impression is that there was not much to choose between the products of the private firms and the products of the government factory. Both the industry and the factory produced their failures and their successes. There is a great deal of luck in the production of a good aeroplane.

(The Witness withdrew.)

Now, Sir John, the next witness is the one who deals with the chemical matter. As I have told you, he is not a manufacturing or industrial chemist; although he has deliberated with those who have drafted this statement of evidence, he does not

Mr. JOHN DESMOND BERNAL, M.A., called and examined.

1110. *Mr. Bernal*: My name is John Desmond Bernal and I have been for seven years a lecturer in crystallography in Cambridge University, and last year I was appointed Assistant Director of Research. My work in crystallography brings me very much in contact with problems covering the whole range of the chemical industry. That is to say, we have to examine industrial products and we have to consider processes and things of that sort. I cannot, on the other hand, claim to have direct practical experience in those fields.

In considering the nature of the chemical side of armaments, the main fact to bear in mind is that, unlike heavy armaments and unlike aeroplanes up to a point, chemical armaments are used up only in war time and, consequently,

1108. *Professor Gutteridge*: There was a little bit of trouble at the time. The Fokker aeroplane was getting the better of the BE 2.

Mr. McKinnon Wood: Yes.

1109. *Sir William Jovitt*: There is just this, before I leave aeroplanes: I am reading from the Report of the Committee of Public Accounts, which I see is very up-to-date, it was ordered by the House of Commons to be printed on 4th July, 1935, and it deals with this question. Under the heading "Air Services" it says this:—

"Non-competitive Contracts. The Public Accounts Committee of 1934, in Paragraph 21 of their Second Report, reviewed the subject of non-competitive contracts for aeroplanes and engines, which had been previously considered by the Public Accounts Committee in 1925 (Paragraph 46 of their Second Report of that year). The Committee of last year found that the conditions disclosed at the Inquiry of 1925 still prevailed, and that no substantial extension of the field of open competition had been secured since that date. While regretting that further progress in that direction had not been found possible, they felt that in the meantime they could only rely upon the Air Ministry to continue to use their costing and other data to the fullest extent to secure from manufacturers fair and reasonable prices and to seek further powers if at any time the position appeared to be unsatisfactory. They suggested, however, that the position should be reviewed by the Public Accounts Committee after, say, five years, or in the event of any material alteration of the conditions such as might be caused by a considerable expansion of the Air Force. In view of the fact that such an expansion has now been decided upon, your Committee have given further attention to the subject, and they have ascertained that, while the underlying conditions have not improved in any way, the percentage of contracts placed on the basis of competitive prices, though not actually by competitive tendering, will be substantially higher this year. Your committee were informed, however, that the need for rapid production at maximum capacity must to a very large extent preclude competitive tendering and make it necessary to confine orders to some 14 or 15 firms who have long experience of the particular type of work required. On the other hand, the hope was expressed that, with orders on an increased scale, lower prices might be expected."

That you will find is all dealt with in the Report from the Committee of Public Accounts and you might like to have the reference to that, Sir John.

pretend to have any internal knowledge of the organisations dealt with. Mr. Bernal is Assistant Director of Research in Crystallography and Stereochemistry at Cambridge University.

the problem there is not the problem of the preparation of large stocks of weapons, but the possibility of rapid expansion in the case of war. That, of course, is also affected by the problem of the export of explosives and poison gas, which will go on as long as there are any wars in any part of the world. Therefore, the question in relation to plant is largely a question of the possibility of rapid expansion rather than existing plant. All the evidence goes to show that there is very little specialisation in chemical manufacture, that is to say, almost any plant can produce, in a relatively short time, almost any chemical needed, explosive or otherwise, given the raw materials. That is starting from the very beginning. The government T.N.T. factory during the War was producing its

17 July, 1935.]

Mr. JOHN DESMOND BERNAL, M.A.

[Continued.]

first ton of T.N.T. three months after the first sod had been cut for the building of the factory. And so the problem is very different from that of the other aspects of armaments.

The chemical armaments can be divided into two quite distinct groups, the explosives and the gases, but although they are distinct in their uses, they depend, to a large extent, on the same raw materials. I would like to stress very strongly the importance of raw materials for the war chemical industry. The main raw materials for both explosives and gases are very common substances; they come down to coal, particularly in the form of coal tar from the gas industry, lime, salt, sulphur and arsenic. All those, with the exception of sulphur, are produced in ample quantities in this country. The supplies of sulphur will probably be ample owing to the new processes which have been developed for extracting it. Given that condition, it is very much more difficult to localise the chemical industry than it is to localise other industries.

The explosives industry uses as its prime raw materials coal, sulphur and nitrates, and the nitrates themselves are strictly intermediate: they may come either from Chili saltpetre and are therefore imported, or they may be made from the atmosphere. In this connection one can see the very close relation between the war and peace time state of the chemical industry. In peace time nitric acid is used practically exclusively in the production of fertilisers. The same plant can immediately—this is not a matter of months but of weeks—turn over from fertilisers to high explosives. Therefore, its productivity in war depends on the state of the industry in peace. At the same time, there is a continuous and very large production of explosives in peace time and, of that, during the last year for which the figures are available, 50 per cent. was exported. I do not think I need go into the detailed processes, which are all given in the pages of the statement of evidence dealing with explosives. It can be seen from that that there is no particular difficulty in making explosives but that at present the explosives manufacture is practically confined to the I.C.I. group of factories, particularly to the Ardeer factory, which the I.C.I. acquired when they amalgamated with Nobels. For that reason, there is no technical difficulty at all in separating the manufacture of explosives from the rest of the chemical industry. Explosives manufacture is something which can be, in peace time, taken over completely by the government. Already the government makes, through its own arsenals, a considerable amount of explosives of exactly the same type as are made by the I.C.I. factories. It is true that the I.C.I. factories also make certain other explosives for industrial purposes—mining purposes particularly. Whether those will come under the same schedule of control is a further point to which I will return later.

The problem of gas, however, is a very much more limited one. In the first place we may say that there is no large production of poison gas—at any rate next to none—going on in the country at the present time. But the production of poison gas is, of course, something which can be undertaken with extreme rapidity, on account of the great simplicity of methods of manufacture and the common nature of the materials required. I would simply quote one example, that of Lewisite, which is an improved poison gas from the point of view of physiological damage, because it combines the blistering powers of the ordinary mustard gas with the arsenic which it contains, producing arsenical poisoning in the victims. Lewisite is produced by the simple method of bubbling acetylene through a mixture of arsenious chloride and aluminium chloride, the latter being a catalyst. That is a very simple operation which could be done in any chemical works and could be put into operation at almost any time. That is a case of the most high toxicity. The figures are given here: one-twentieth of a milligram in a litre—that is roughly 1/100th the concentration of the material

in a London fog—will produce death from exposure to it within a few minutes. This can be produced in enormous quantities, the materials there being essentially salt and arsenic. But the chief difficulty about the question of control is that there is no way of separating the normal process of chemical manufacture from those which will be needed to produce poison gas. We have, of course, the official assurance on the subject of poison gas, which might seem to rule the question out of court altogether. It says in the War Office Technical Notes on Defence against Gas "The use of gas was prohibited by the Geneva Gas Protocol of 1925, to which most, but not all, of the principal Powers of the world have subscribed. The British Army must, however, be prepared to defend itself against the use of gas by any Power with which it may be at war. On the outbreak of war, the British Government will endeavour, in conjunction with its allies, to obtain from the enemy Government, or Governments, an engagement that poison gas shall not be used as a weapon of war, if any of the Governments concerned have not ratified the Geneva Gas Protocol." I may say that substantially this form of words is also to be found in the French Manual, and, I believe, in every official manual on military defence throughout the world. It implies that, in fact, there is going to be an attempt to use poison gas, and, although it is not made in large quantities—that is very natural, because it does not keep very well—it is being continually experimented on. In the House of Commons last year it was stated that roughly 3,000 animals were killed in the course of ten years in experiments with poison gas and, of course, the experiments were still continuing. I make this point to show that we must, from the point of view of actual war potentialities, consider poison gas as probably more important than explosives, and therefore that any scheme for the control of armaments must take into account the control of the production of poison gas.

Of the materials used for the production of poison gas the chief substance is chlorine. Chlorine, I think, enters into nearly every existing poison gas—probably not the latest types, but the standard types of gas, and those likely to be used in the greatest abundance. Chlorine is practically exclusively made, in this country and, I think, in other countries, by a process by which electric current is passed through common salt, which separates it into chlorine, on the one hand, and into caustic alkali, on the other. This process—the Castner-Kellner process—is one of the most important means of producing, not so much chlorine gas, but the caustic soda which is used in many industrial processes. The chief chemical economic difficulty which arises out of this is that it is extremely difficult to find sufficient sale for the chlorine produced. At present something like two-thirds of the caustic alkali that is produced in this country is produced not by the Castner-Kellner process, but from ordinary alkali just by the mixture of lime and soda in the soda works of the I.C.I. (The Castner-Kellner process is also controlled by the I.C.I.) It is simply a matter of switching over from the less expensive Castner-Kellner to the more expensive soda process, according to the demand for chlorine.

The point that I make here is that any avenue for the use of chlorine would be extraordinarily valuable to the firms concerned, because it would enable them to save on the process, and they have been exploring, very naturally, all avenues for the use of chlorine. Unfortunately for them, some of the uses of chlorine have been discarded. Chlorine was formerly used in the artificial-silk industry. It is now no longer used. Therefore there is a further impetus to find a use for chlorine. It is unlikely at the moment, in peace time, that any abnormally large stocks of chlorine would be required for poison-gas purposes. But there is another purpose for which chlorine could be used, also in connection with poison gas, and that is, as a decontaminant for poison gas which has been used on a piece of ground and which is effective for poisoning people on that ground for a considerable time. The

17 July, 1935.]

MR. JOHN DESMOND BERNAL, M.A.

[Continued.]

most valuable agent for removing it is bleaching powder, which is made out of chlorine and lime. The point to be remembered is that the amount of chlorine required in bleaching is something like ten to twenty times the amount of gas that it will decontaminate; and so if a decontaminant is to be used on a large scale it would provide itself far greater need for chlorine than would be demanded for the poison gas. It does not seem very likely that that will be done. Mr. Davidson Pratt, secretary of the United Chemical Manufacturers' Association, stated in public that he considered that decontamination would need to be done largely with water and earth—not very effective chemicals for the purpose—because it was not unlikely that there would be an inadequate supply of bleaching powder. That reflects the competition for chlorine as between the necessity in war-time for the production of poison gas and the necessity for decontamination of areas which have been affected by it. If decontamination was required it is quite clear that if all the Castner-Kellner process was worked at a high pressure it would still be difficult to provide enough chlorine for both those purposes, though it would be very easy to provide enough chlorine for offensive purposes.

The position as regards the other constituents is also fairly simple. The sulphur constituent and the arsenic constituent can be found. I should like to lay particular emphasis on the arsenic constituent. Arsenic does not enter into many ordinary chemical processes. It is very much apart in the use to which it has been put for its definitely poisonous properties—that is, for weed killer, insect killer, and so forth—but there is a close connection between the arsenic destructive gases like Lewisite, the more poisonous kind, and the preparations which are made for the purpose of dealing with insect pests, and so forth. So there would be no difficulty in including arsenical compounds in any offensive poison-gas.

The position then is this. That there is no difficulty under any schemes in providing for the proposed ownership or control of poison gas manufacture. The question of the desirability is another matter. We have here a case where it is quite clearly of special advantage to the firms concerned that both chlorine for poison gases and chlorine for decontamination should be fully used; and therefore a state of war or danger of war has a definite money-value to the firms concerned. In the case of decontamination that appears in a more innocent form. In the government circular on defence against gas, which was issued about three days ago, local authorities are instructed, or advised, to lay in stocks of bleaching powder. Now it is quite clear that if stocks of bleaching powder of anything like the adequate amount were to be laid in, it would completely change the whole position relative to the production of chlorine. In fact, if large stocks had to be laid in for a year or two it would probably mean that the price of chlorine had to be doubled as a result of that demand. Presumably that will not occur; possibly, as in France, the amount of bleaching powder laid in will be nominal. Nevertheless it is in the interest of the bleaching-powder firms to see that adequate defensive measures against gas are taken. A certain amount of publicity of this sort has been undertaken by associations which are connected with such firms, and we have now a possibility of such recommendations being actually put into practice. So much for the situation with respect to gas.

There are two other war materials which come into the chemical category, but less directly. One is synthetic petrol from coal, which is produced by I.C.I. by an hydrogenation process. That this is definitely of military value is virtually admitted by the enormous subsidy paid to I.C.I. by the government by exempting such petrol from duty. This action in itself provides an additional argument for the general thesis that the whole of the chemical industry is of so much value to the government in time of war that it must be either nationalised or put under control.

The second raw material which is connected, less directly but very singularly, with the chemical industry is nickel. The connection of nickel with the

chemical industry is not accidental. It might appear to be, insofar as at the commencement of the chemical industry it was the Brunner Mond Company that began with a process in which nickel was used. Incidentally the process of hydrogenation is evolved partly by the nickel catalyst. That led the company to acquire control, through the International Nickel Company, of practically 80 per cent. of the world supply of nickel, and that nickel, as has been pointed out, is absolutely necessary for heavy armament steel. But the actual metallurgical process by which nickel is extracted is totally different from that of other metals in that it is carried out by a chemical process which turns the nickel into a gaseous compound. Consequently the extraction of nickel technically as well as economically forms part of the chemical industry. There is no question that the main use of nickel is for war purposes. The difficulty of control lies in the fact that the actual supplies of nickel are not located in England but they are located in the British Empire—in Canada. So much for the actual materials and process.

The recommendations of the Union are graduated. It is quite clear that the only real solution in connection with the chemical industry is complete socialisation, complete nationalisation of the industry. That is our recommendation based on the impossibility of considering any part of the chemical industry as potentially separated from war purposes. There is no chemical factory that cannot be used for the production somehow or other of war products, be it gases or explosives, and there is a connection between the raw materials needed for war purposes and those which are needed for the ordinary chemical industry. The difficulty of separation would be very great. There is no doubt that if this general question of nationalisation were considered it would be technically quite possible, because the organisation of the industry differs very much from the organisation of the other industries in that it is virtually completely under the control of Imperial Chemical Industries. As you can see from the charts which are appended to the evidence, particularly Figure 2A, which gives the structure of Imperial Chemical Industries, there is no section of the chemical industry that is not represented by one or other of Imperial Chemical Industries' subsidiaries. The structure is very different from the heavy armament section and the Vickers group. It is not a question of interlocking directorates so much as a complete and very efficiently administered trust. In the next chart can be seen the foreign connections, which I only mention because they constitute one of the strongest arguments for the nationalisation of the industry as a whole. Insofar as the foreign connections are concerned you can see they include connections with chemical firms and subsidiaries in every country in the world which is of importance industrially. That means that Imperial Chemical Industries can and do make agreements with other countries, particularly with combines like Du Pont de Nemours, which, considering the material value of the products involved, are as powerful in affecting policy as a treaty between governments, and such important transactions should not in our opinion lie in the hands of an individual company. But that very concentration of organisation in the country would make relatively easy its complete nationalisation.

Failing nationalisation we suggest that at least effective inspection and control and license should be applied, and the methods of applying that control are set out in the fifth and sixth pages of Part VIII*—particularly the sixth page. The actual proposals are on the right-hand side, "That all explosives (excepting black gunpowder), whether for industrial or military purposes, be manufactured by the state from the raw materials and intermediates supplied by the private chemical manufacturers." That is in effect an extension of the present government factories to cover all explosives, and is tech-

* Appendix, pp. 210-211.

17 July, 1935.]

MR. JOHN DESMOND BERNAL, M.A.

[Continued.]

nically quite feasible on account of the present concentration of the explosive business belonging to the I.C.I. group. There would be no technical difficulty and the amount of money involved would not be large. The figures are given on the same page in the left-hand column. Approximately £20 million is the capitalised value. Then "(b) That licences for export of all raw or semi-finished materials likely to be used in the manufacture of explosives or poison gases be issued by the state." That of course, does involve technical points of considerable complexity.

The actual schedules of commodities are given below. They actually consist of two groups. The first group are the main basic raw materials, nitric acid and sulphuric acid, refined glycerine, alcohol, toluene, ammonia or ammonium compounds, picric acid and acetone. All those are substances which are used to a considerable extent in industry. They are also used in the manufacture of explosives particularly. It is difficult to say how much is used for explosives on account of the method of publication of the figures, but at any rate there are large quantities of sulphuric acid—about 20 to 25 per cent. of the whole production—used for nitration purposes; whether entirely for explosives nitration or for purposes connected with celluloid it is absolutely impossible to check from the figures. It is essential that those raw materials should come under licence, because anyone possessing them could with relatively simple plant make all the products they wanted.

The second group are more particularly associated with the manufacture of poison gas. I will not read out the list, it is highly technical; half of the substances are fairly common like acetone or picric acid, others like phenylarsenic acid are only of use for poison gas.

Finally we come to the lethal gases themselves which, of course, cannot be specified by name because the great majority are secret. They can only be specified by their lethal capacity. Phosgene which is a relatively dangerous gas is taken as the modern standard of lethal gas. Originally it was considered pretty lethal, but it is nothing now compared with the newer gases.

Now I come to the third recommendation, "That the private manufacture of certain poison gases be prohibited. The reagents in question are given in the schedule of commodities." Those recommendations are themselves quite practicable, but, of course, they are open to very considerable possibilities of evasion. It is going to be extremely difficult to check the working out of these intermediaries in factories connected with the parent factories, in fact, it will be quite impossible—as you can see from Figure 2B—because if this is applied in this country there is nothing to prevent any of the I.C.I. joint companies from carrying out the finishing process, without breach of any agreement.

Secondly, although that is feasible, it would obviously be much better to have complete control of the industry as suggested on the next page of Part VIII, in the left-hand column:—"The type of control which seems to us to be essential would consist of boards on which were represented the government officials, both technical, administrative and financial, representatives of the technical, managerial and office (accountancy) staffs, and also representatives of the workers elected democratically by secret ballot in the factories."

That last remark is very important because the chemical industry, particularly under war conditions, is one of the most dangerous of industries. Only a few days ago we read of the explosion at the Rheindorf works in Germany. We have not the figures, but between 1,000 and 2,000 people must have been killed. I think in 1927-28 the Leuna works blew up and a thousand people were killed. All these things are to a large extent due to a lack of regard for working conditions which can only be checked by representatives of the people working in the industry. I will read the end of the recommendations. "These boards would in all cases be of four main classes, Co-ordination (for different products for various factories, e.g., intermediates), National, Regional and Factory. All the management of the nationalised

industries to be subject to Parliament so that debate could occur and questions be asked with regard to its position and management."

1111. *Chairman*: May I ask one or two questions, because I do not quite follow part of this? On the sixth page of Part VIII there is a passage, "In the case of explosives, the varieties are so great, and the difference between pacific and military use (except as propellants) so ill-defined, that it is impracticable to separate them." Do you agree with that?

Mr. Bernal: Yes, I agree with that.

1112. *Chairman*: Then near the top of the next column do you see "It is proposed (a) That all explosives (excepting black gunpowder) whether for industrial or military purposes be manufactured by the state from the raw materials and intermediates supplied by the private chemical manufacturers"? The result of that would be, would it not, that all explosives whether for industrial or military purposes would be manufactured by the state?

Mr. Bernal: Yes; that is so.

1113. *Chairman*: And the state would then be a trader in respect of explosives for industrial purposes. You could only acquire them from the state?

Mr. Bernal: Yes, that is perfectly true.

1114. *Mr. Spender*: You stated, as I understood, that another war would have a money value to the I.C.I. Would it not be true to say that a second war, taking the whole industry, civil and military together, would inflict a very considerable dead loss upon their trade?

Mr. Bernal: My answer to that would be that it would be best to examine the condition of the constituent firms of the I.C.I. before and after the late War. On their own reports the War was a period of great activity and they certainly did not emerge from the War in a position of financial weakness.

Mr. Spender: I am only suggesting that the considerable amount of industrial work that is now dependent on the activities of I.C.I. would lead to the conclusion that the loss caused by a second war to such a penetrating industry would probably be disastrous.

1115. *Sir Philip Gibbs*: Is it a fact that these materials are so common that most industrial nations would now be able to manufacture this poison gas and explosives?

Mr. Bernal: That is so.

1116. *Sir Philip Gibbs*: Are there many nations who are unable to do so? Apart from the primitive nations is there any civilised country in Europe which is unable to provide these explosives themselves?

Mr. Bernal: Many of them do not do so. The chief countries that do are ourselves, Germany, France and, to a certain extent, Czechoslovakia and Italy. Other countries have their government factories of course. We could get out a list of the countries if you would like it to-morrow?

1117. *Sir Philip Gibbs*: Thank you very much. I would like to ask one other question and that is this: Do you think from your own knowledge that there is much export of materials for poison gas or for explosives to these other industrial countries?

Mr. Bernal: We can get figures for you.

1118. *Sir Philip Gibbs*: Thank you very much.

Sir William Jovitt: The explosives figure will be wrapped up in the other figure. Military cartridges obviously contain a certain amount of explosive, but I think we can get you the figures of explosives as such.

1119. *Sir Philip Gibbs*: I would like to ask this witness whether he thinks there is any export of poison gas. Is it possible to export poison gas in its finished state?

Mr. Bernal: Chlorine can be called poison gas or not; it is the same whether it is used as poison gas or not; that is exported, but as far as we know no other poison gases are being exported.

1120. *Professor Gutteridge*: I suppose that applies to gas shells as well, does it?

Sir William Jovitt: I will try to get those figures to-morrow if I can.

Chairman: That is all we wish to ask this gentleman.

(Adjourned till to-morrow at 11 a.m.)

EIGHTH DAY

Thursday, 18th July, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., R.R.C., LL.D.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).Mr. D. HAIGH (*Assistant Secretary*).

The Rt. Hon. Sir WILLIAM JOWITT, P.C., K.C., appeared on behalf of the Union of Democratic Control.

Mr. RONALD MCKINNON WOOD, O.B.E., M.A., F.R.Ae.S., recalled.

1121. *Professor Gutteridge*: The Bailhache Committee, if I may call it so, was appointed to inquire into the Flying Corps generally, was it not?

Mr. McKinnon Wood: Yes.

1122. *Professor Gutteridge*: But incidentally I believe they also inquired into the working of the Royal Aircraft factories.

Mr. McKinnon Wood: Yes.

1123. *Professor Gutteridge*: I have not been able, although I have been trying to, to get hold of a copy of the report, but perhaps you can help me with regard to this. I think in certain respects they reported adversely to the Royal Aircraft factory, did they not?

Mr. McKinnon Wood: They made certain criticisms. They mentioned the point that I mentioned yesterday, that in designing experimental aeroplanes there are bound to be a number of failures, but they commented on the number of very successful aeroplanes that had been produced, and they commented adversely on the fact of some of the subordinate officials at the factory which they thought might irritate the people in the industry. There was one case in which a subordinate official at the factory had started measuring up one of the products of the industry, and his action had been promptly repudiated by a higher authority. Then the report said there would always be certain complaints as long as the aircraft factory and the Flying Corps were under a common head, and recommended a separation.

1124. *Professor Gutteridge*: Did not they recommend, if I remember rightly, that the aircraft factory should confine itself to the experimental work? Was not that one of their recommendations?

Mr. McKinnon Wood: The findings were that the factory should continue, but it should be confined, I think they said, very much as at present to trial and experimental research, the preparation of drawings, repairs and the manufacture of spares—it is not very clear to me whether trial and experiment and the preparation of drawings does or does not include the designing of aeroplanes in competition with the trade—but certainly it should not undertake manufacture on a big scale.

1125. *Professor Gutteridge*: May I interpolate this? I was wondering what you yourself contemplated. Have you contemplated a manufacturing body, or merely an experimental national factory?

Mr. McKinnon Wood: I should prefer that the whole of the design and manufacture and experiment was conducted in a state organisation.

1126. *Professor Gutteridge*: All concentrated in the hands of the state?

Mr. McKinnon Wood: Yes.

1127. *Professor Gutteridge*: You do not think that if that was done there would be a certain danger of over-run standardisation, do you?

Mr. McKinnon Wood: I think it would be necessary to do it in a form of providing for competition between staffs.

1128. *Professor Gutteridge*: Would you mind explaining that a little more in detail, because I am not quite sure that I understand that?

Mr. McKinnon Wood: At present particular competitions are between four or five contractors, but in the same way, a specification of the requirements of the Air Force would be issued to, I think not quite so many, but to a number of different state factories, and the drawing office staffs would then compete in designing the machines required by the Air Force.

1129. *Professor Gutteridge*: If I understand you correctly, any such competition as there is between individual firms you would prefer to have between individual government factories. Is that part of your plan?

Mr. McKinnon Wood: Yes.

Sir William Jowitt: There was another Committee, was there not, the Burbidge Committee?

1130. *Professor Gutteridge*: Yes, there was the Burbidge Committee, and unfortunately I have not so far been able to get a copy of their report; and I think there was a third one, too.

Sir William Jowitt: I do not know of the third one.

1131. *Professor Gutteridge*: I do not know how far it is important, but what is in my mind is this. I have always understood that the Royal Aircraft factory concentrated on the production of the Napier engines, which proved to be a failure. The Napier firm undertook to build the engine to the specification of the Royal Aircraft factory, but the Rolls Royce factory declined to have anything to do with it, and produced an engine on their own lines. I have always been given to understand that the production and development of aeroplanes during the War would have been very much more rapid if the Royal Aircraft factory had not insisted on its own designs. That was my point. I do not know whether you can throw any light on that, can you?

Mr. McKinnon Wood: I think the facts were that the aircraft factory had got out drawings up to a certain point for engines above the size that they had actually produced, and that these drawings were given to Rolls Royce and to Napier, the idea being that the particular aeroplane engines that were wanted would best be produced by those firms and that the factory drawings would give them a start-off; but the drawings were actually rejected by Rolls Royce, but accepted by Napier, as the appropriate type of engine. I think they were different drawings, for the two firms, of two different engines.

1132. *Professor Gutteridge*: As a matter of fact, I think the S.E.5 was the only really successful plane that the Royal Aircraft factory produced?

Mr. McKinnon Wood: Well, the Bailhache Committee said that the B.E.2 aeroplanes showed a great advance in aeronautics.

18 July, 1935.]

Mr. RONALD MCKINNON WOOD, O.B.E., M.A., F.R.Ae.S.

[Continued.]

1133. *Professor Gutteridge*: That was a Bleriot.

Mr. McKinnon Wood: "B" came from "Bleriot". It was only a compliment to Bleriot, as he was one of the first people to put the propeller in front of the aeroplane, and this aeroplane followed that design. That was the only connection, really, between the two. The "F.E.", which meant "Farman Experimental," was so called because the propeller was behind, and that again was the only

connection with Farman, and that was a good aeroplane. The Committee also said that the B.E.7 served its purpose, and that the B.E.2.C. was strong, and aeronautically sound.

1134. *Professor Gutteridge*: That was successful?

Mr. McKinnon Wood: That was a highly successful aeroplane.

Professor Gutteridge: Thank you for helping me with regard to that.

(The Witness withdrew.)

1135. *Sir William Jowitt*: Then, Sir John, I have Lord Marley here. He would like to answer any questions that the Commission might desire to ask regarding the general aspect of the whole case.

Chairman: There were some questions that some members would like to ask you, not technical

questions, but questions bearing upon the exact proposals made in this statement.

1136. *Sir William Jowitt*: I think Lord Marley will answer those, Sir John.

Chairman: Very well.

LORD MARLEY, D.S.C., J.P., D.L., called and examined.

1137. *Chairman*: Did you wish to make any statement, or merely to deal with any questions that you are asked?

Lord Marley: Perhaps, Sir John, I might say this about the whole position. The statement of evidence that the Union of Democratic Control has submitted to the Royal Commission—and I speak as a member of the Committee of that organisation—has been prepared with the greatest possible care that we could apply to it, and we are entirely satisfied with the line of approach conducted by Sir William Jowitt in putting it before the Royal Commission, and with the evidence of our two witnesses.

Perhaps I might amplify one statement which Sir William Jowitt made, in pointing out that we are not a political organisation in the sense that we are affiliated to any political body. We are an entirely free organisation, not affiliated to any political organisation at all, and the line of approach that we have taken to this problem, we believe, is a line which is in the national interest, is in the interest of the nation as a whole. We believe there is nothing in our evidence or conclusions which might not have the support of persons of any political faith or of any political party. I wanted to make that little amplification in the light of the suggestion that we are a Socialist organisation.

Of course, I might go one step further and say that a Socialist is a person who believes in common sense, and I would no doubt have the limited support of the members of the Royal Commission in that. It is a question of definition. But, broadly speaking, we are concerned with the national interest in this matter, and we leave the definition of national interest to the individual Commissioners on the facts which we have put forward.

I might say, however, that we do believe in greater publicity for the whole of this business of private manufacture and export of armaments, because we believe that that is a method which may help towards the prevention of corruption. Then we do believe in control of the whole industry, because we believe that that is a method which may help to combat the proved inefficiency of private manufacture. We believe, and we hope we have proved, that it is inefficient in very many respects, and we believe that control would help to prevent that inefficiency; and, finally, we do believe in national ownership, and we support national ownership, because we think that is a method of avoiding the tendency towards encouraging militarism, the use of militarism as a tendency towards the encouragement of ill-faith, over-emphasis of disputes and misunderstandings between countries, which is a temptation which must be felt by those who make a living by profits from the sale of armaments.

There was a question, I understood, put with regard to the profits of chemical industries during yesterday's proceedings, and I merely want to say that we do not for a moment suggest that the chemical industries would in any way encourage war

merely to make profits. But it is a fact that during a war, chemical industries do make very large profits, and while not saying a word about the encouragement of war, I do say that it would be in the national interest that those profits should be available for the nation as a whole instead of for private shareholders, because if those profits were available for the nation as a whole, it would result in more armaments at a cheaper cost rather than fewer armaments at a heavier cost. Again, if we are concerned with efficiency at all in this matter, that seems to me to be self-evident. This matter was brought out in evidence before the American Committee, and it was reported in *The Times* in September of last year, when an investigation was made into the capital of the Du Pont Company in the four war years. The figures are quoted in *The Times*. We are told by Mr. Du Pont that the Delaware Company had earned in the war years 1,245,000 dollars, and at the end of 1918 their books showed a surplus of 60,000,000 dollars ascribable to war profits, though those took no account of bonuses paid during the war years. Senator Bone pointed out that according to the company's annual report for 1918 that represented 458 per cent. on the total volume of business—458 per cent. profit on the total volume of business. Any profit in the neighbourhood of 400 per cent. or more seems to us to be somewhat excessive, and we cannot help thinking it would be to the advantage of the country were those profits available for the mitigation of taxation or—and I speak here as a soldier who suffered severely during the War from the inadequate supply of ammunition in the early stages—for the advantage of those who unfortunately have to conduct the fight. I remember, if you will pardon a personal reminiscence, Sir John, very well when we had to use American ammunition during the early stages of the War for our artillery, and in my own unit we always took care to be as far away as possible from our own artillery on those occasions, because unfortunately those shells had a habit of bursting at the muzzle instead of where they were supposed to burst, and inflicting suffering on our own people rather than on those for whom they were supposed to be destined—another disadvantage, if I may say so, of the private manufacture of arms.

I do not think I have anything to add, Sir John, but if there are any questions, I would do my very best to answer them.

1138. *Chairman*: Yes. Would you mind my asking you a few questions, in order that I may realise exactly what it is that your proposals amount to. First of all, the suggestion is that in order to deal with this question effectively, and the question of the armaments industry generally, it is essential to consider the three separate heads of heavy armaments, chemistry, and aircraft. Well now, is the conclusion that one is to draw from your case that it is possible to deal with each of those classes separately, in this sense, that it might be advisable to nationalise one head, we will say heavy armaments; partly nationalise another head, we will say aircraft;

18 July, 1935.]

Lord MARLEY, D.S.C., J.P., D.L.

[Continued.]

and control chemistry—that you may adopt two systems, either nationalisation of one or control of the other, and so forth, or deal with them all by one system?

Lord Marley: The point is this, Sir John. First of all, we do not venture to suggest to the Royal Commission what conclusions they should draw. We try to place before you evidence from which we believe you can only draw one conclusion; but that is entirely for the Royal Commission, and naturally we do not suggest that; but the line we take is this, that there are two extremes in this business. On the one hand, there is complete national ownership and control—nationalisation. On the other hand there is private ownership and control. Between those two there are an infinity of variations of marginal points. Now, if we take these three separate points which you have enumerated, we do not say that each of those will come in the same place between those limits. We believe, for instance, that the production of purely war material, such as armour plate, can be and should be completely nationalised. We believe that there are other aspects which may not go nearly so far in that direction.

1139. *Chairman:* That is what I gathered from the statement. I mention that because we have had evidence here from one witness who has had considerable experience, Dr. Addison, that in his view, whatever is done there should be only one producing and administrative authority. I wondered, in view of what you have now indicated, what you wish to say as to that?

Lord Marley: I should say—and here I am speaking personally—that while you might have one controlling body, there is no reason why that controlling body should not deal with each of these aspects of arms production in its own way. In so far as one is completely nationalised, there could be complete departmental control; in so far as another is only partially publicly controlled, there would be only a partial control. I think the three could be co-ordinated under one Munitions Ministry. That is only a personal idea in amplification of what Dr. Addison said.

1140. *Chairman:* To deal with these separate heads one by one, if I may, take first of all the heavy armaments. On the third page of Part IV of the Statement of Evidence*, a few lines down on the right-hand column, the author is dealing with the question of what I may call armament steels as opposed to commercial steels. He says: "The point is that, although melted in the same furnace as commercial steels, armament steels are earmarked from the start and only a small proportion is sidetracked"—by that he means used for some other purpose?

Lord Marley: Yes.

1141. *Chairman:* Then he goes on: "But it should be borne in mind that an increasing number of commercial purposes are being found for these alloy steels"—and by that I understand he means what we call armament steel—"formerly used for armaments only." Now, what I wanted to ask on that is this: whether or not there is any substantial amount of this armament steel which is not used for purely armament purposes?

Lord Marley: Well, it is not a matter on which I have expert knowledge, I am afraid, but of course it is quite clear that the most recent of the types of armour plate are composed of the latest alloy steels which presumably would not be largely used for commercial purposes.

1142. *Chairman:* Yes, but I wanted to know from a practical point of view whether this armament steel has not been substantially used for purposes other than armament purposes, and that that use is increasing?

Lord Marley: I think we are dealing with it in a slightly different way, if I may say so. You have got your steel production at the beginning—

1143. *Chairman:* You do not follow my point, I think. What I am driving at is this: whether or not your proposition which you come to in later pages, that you would nationalise the production of armament steel, does not involve the nation becoming traders in that steel if it is used for other purposes?

Lord Marley: Not necessarily.

1144. *Chairman:* Well, if nobody else can make it, who are they to get the steel from?

Lord Marley: There is no reason why a national factory should not supply the small quantities of particular steel alloys which may be required.

1145. *Chairman:* Then they are traders to that extent?

Lord Marley: Oh, well, yes.

1146. *Chairman:* That is all I wanted to know; and I wanted to know, as far as anybody can tell me, what proportion of armament steel is being used for purposes other than pure armament purposes?

Lord Marley: Now I do not know the proportions, Sir John, but I am pretty certain that as private enterprise develops it will be an increasing proportion, because when you get your special steel produced, specially hard steel for specific purposes, you will have an increasing proportion being called for by private enterprise.

Sir William Jovitt: May I suggest this, that I might get the Union to write a letter to your Secretary dealing with this point. That might form the groundwork for your investigations hereafter.

1147. *Chairman:* Very well. Then will you turn to the first page of Part VIII of the Statement of Evidence.† On the right-hand column you see you come to deal with this again, and in the second paragraph it says: "The differences between the production of steel for armaments and that for commercial products start from the time the raw metal is placed in the furnace." That is exactly the same point as in the earlier page. "This definite distinction between arms and civil production is a factor of enormous importance in the consideration of the practicability of the institution of a state monopoly in the heavy arms industry." Then you go on to refer to the principle of separation in the memorandum presented to the Disarmament Conference by the French, Spanish, Polish and Danish Governments, and their object is stated later: "The sole object is to reserve to the state that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes." Now, is it a fair conclusion from all your statements that those who are responsible for this case do not accept that as a practical proposition—their proposals are something entirely and essentially different?

Lord Marley: No, I would not say that.

1148. *Chairman:* Are they not, if you consider them? In no part of this case are you attempting to deal with the question as to whether it is practicable to assume control over an article at its first transformation from a pacific into a warlike article.

Lord Marley: The answer to that is that we place before you this evidence, in which we suggest that it is possible to publicly control from the very moment when the raw material becomes first destined for a warlike purpose. But when that moment is, we cannot say, in view, on the one hand, of our lack, naturally, of complete knowledge—we have not got the powers of investigation which the Royal Commission have—and, on the other hand, by reason of the changing nature of steel production, which may gradually push further one way or the other at any moment. Well, now, in order to clear up that point it is quite certain that we must choose an arbitrary point. If we are in favour of national control or ownership at all, we must choose an arbitrary point, and that point may subsequently vary in the general development of production in private industry, but there is no reason why state ownership should vary. If, for instance, the state has a monopoly of the production of a certain alloy steel, there is no reason

* Appendix, p. 173.

† Appendix, p. 206.

18 July, 1935.]

Lord MARLEY, D.S.C., J.P., D.L.,

[Continued.]

why it should not, if it is necessary, even become a trader in that particular alloy steel if for commercial purposes it becomes demanded; but our point is that we are not concerned with the commercial side, we are concerned with the infinite desirability and the practicability of the state becoming the owner of warlike production in this country.

1149. *Chairman*: Yes, but what I wanted to test was your view, or your organisation's view, of the practicability of this proposal which has been put forward, which suggests that the moment of control, when control should commence to operate, is the moment when the article ceases to be of civil use merely, and becomes useful for warlike purposes. Now, take your statement. You see, with regard to heavy armaments, you commence at the commencement. There is no question of an intermediate stage. You commence at the commencement and you point out and emphasise that armament steel is never, practically, a civil article—if I may use that word—and the same equally with chemicals and with aircraft. You do not attempt at any stage to say: "Now, at this stage in the manufacture, it ceases to be one and becomes the other." Throughout this statement, you start from the commencement under each head. Is that right?

Lord Marley: No, Sir John, my point is this. Let me put it to you in this way. There is only one man in this country who can say at what precise point national ownership and control of armament production, or of production which can be used for military purposes, should start, and that person is Sir John Eldon Bankes and the Royal Commission over which he presides; because your Commission alone have the power to investigate every one of these problems, and to say where, if you decide that public ownership and control is necessary, it should start in each case.

1150. *Chairman*: If it is true that I am the person, which I do not accept for a moment—

Lord Marley: I am sorry, but I am afraid you must.

1151. *Chairman*:—I want to be advised, and I want to know what your advice is, whether I had better consider this question of starting control at a particular point in the manufacture, or whether I had better accept what I understand is entirely a different suggestion, namely, that it is not necessary to consider that at all, it is not desirable to consider it at all, but in each phase you ought to start at the very commencement.

Lord Marley: Let us take these points. I see in our case that the points of starting will be very different. If we take the production of guns, of artillery, it is quite clear that the state is already a manufacturer of these articles and we believe should be the sole manufacturer of these articles. We know that there are many countries in the world where the vastly greater proportion of production of these materials is already state-owned. I am told, for instance, that in France something like 80 per cent. of production is state-owned, whereas in this country, in rough figures, it is only 20 per cent. We believe that it would be in the national interest that the whole of that should be state-owned and controlled. Now then, when we come to the chemicals trade, it is a different proposition, because it is quite clear that certain chemical products—and I speak as a non-expert in this—can at one time be used for pacific purposes and with a very slight variation can be adapted for war purposes. Now, exactly where the control comes in it is extremely difficult to say, and that is why I say that if you decide that control is necessary, you can in your recommendations give the point. If you want my advice for what it is worth, and I do not pretend it is worth a very great deal, Sir John, because I have not your experience or access to documents, I should say the sooner the better; because the sooner you start the cutting-out of inefficiency, of private tinkering and of corruption—and that will

always be the line we shall take—the sooner we start national control, the better we shall be pleased. But I would, of course, like control to start sooner than later, in the national interest. For purely Conservatives, or even Lloyd Georgeites, I would in the national interest say that the sooner control started, the better.

1152. *Chairman*: Take aircraft. You have not dealt with that. I want to test your view as to the practicability of one of these propositions that we have got to consider, and that proposition is that you can, as a practical matter, deal with this whole question of armaments from the point of view that there is a stage at which you can put your finger, and say it ceases to be one and becomes the other. Now, having regard to the evidence that we have had from Mr. McKinnon Wood yesterday, is there any stage in the aircraft branch at which you could put your finger and say, yes, it ceases to be one and becomes the other? Is it not obvious that—

Lord Marley: I do not know that we could indicate a precise stage. But let me say this. The British aircraft industry, by a process of national ignorance, is immensely behind the aircraft industry in other countries. It is not entirely the fault of the industry, but by reason of the short distances involved in this country, and so on; but none of our commercial aeroplanes, none of them, come within 100 per cent. of, say, American commercial planes. In other words, our commercial flying industry is hopelessly inefficient as compared with the progress made, say, in the United States, where a normal flying schedule of 16 to 18 hours from New York to Los Angeles is done in three or four times a day each way. At four o'clock in the evening you leave New York, and you arrive in Los Angeles at somewhere about eight in the morning, at a speed of from two hundred to two hundred and thirty miles an hour, a journey taking somewhere about four and a half days in the train. We have nothing to touch that.

1153. *Chairman*: That does not touch my question, as to whether in the aircraft industry it is practicable to employ this formula.

Lord Marley: Our point is that it is not practicable in the national interest to leave it to private enterprise. Private enterprise has so failed that we suggest that if we had, as has been suggested, so many national factories competing with each other—

1154. *Chairman*: I quite understand you advocate nationalisation of all these industries.

Lord Marley: All aeroplane industries, because 80 per cent. of the aeroplanes are used for fighting machines.

1155. *Chairman*: To go on, there is another question I want to ask on this same column, please. You set out a list of arms which in the process of manufacture are produced separately from all commercial work. You say there is a number of them, numbered from (a) to (h). Then the statement goes on: "Materials required for high explosive and shrapnel shell could be purchased in bar or billet from outside sources." Now, high explosive and shrapnel shell are No. (e). Is the proposal there that they should be manufactured from other than armour steel? I do not follow. Why should you purchase bar or billet from outside?

Lord Marley: Well, neither of these requires special steel. Any old stuff does for shrapnel. Shrapnel is merely a thin case with a number of small bullets inside made of anything which will penetrate and cut you up.

1156. *Chairman*: I follow. It is not necessary to use armament steel for that particular shell?

Lord Marley: No. Neither of those is armour piercing. High explosive is a steel shell to burst in the air.

1157. *Chairman*: I follow. Then, lower down, it is stated: "Thus, a separation of the manufacture of heavy arms from that of commercial steel goods,

18 July, 1935.]

Lord MARLEY, D.S.C., J.P., D.L.

[Continued.]

which is a practicable consideration, must assume the government's ownership and control of the steel works necessary for the manufacture of the war stores enumerated above." That means taking over, does it not, the whole trade of armament steel manufacture?

Lord Marley: Of armament steel, yes, that is so.

1158. *Chairman*: Then will you go to the last page? On the right-hand column, under the heading *Nationalisation of the Arms Industry*, it says: "(a) Heavy Arms. (b) Chemicals and Explosives. (c) Aircraft." Then it goes on to say: "Such nationalisation would have to be supplemented by control of the sources of raw materials, e.g., iron, nickel, etc." Now, there is a distinction drawn there between nationalisation of those enumerated heads, and control of some others. What is the difference which is suggested between nationalisation and control?

Lord Marley: The difference is that nationalisation involves the complete national ownership and control of the industry; but when you come to control, it is clear that unless you have a complete system of socialisation in a country you cannot nationally own the raw material, such as iron ore, because unless you have your complete socialisation a great deal of it is used for commercial work, so we say the nation has the right to have all that it needs of the best quality of that ore, wherever it is produced, in this country. Therefore we say we must control the production in order that we may have priority in saying to the private firms, "You have a particularly good type of ore in such-and-such an area, and we shall require from you next year 100,000 tons of that ore." Therefore we control that ore to this extent, that we reserve the right to the nation to have the first claim on the higher quality ore. With regard to the nickel that is mentioned here, I might say that 95 per cent. of all nickel in the world is produced in Canada, and, broadly speaking, no other nation in the world can produce armaments unless Canada provides them with the nickel. Broadly speaking, no other nation in the world can produce armaments, nickel steel, nickel armour plating, and so on, unless Canada provides them with the nickel for that purpose; and we have always said that an examination of the export trade in nickel would lead to very interesting conclusions. I hope, Sir John, that the Commission will go into that; and in any case we have given in our evidence a good deal concerning the nickel manufacturers which will, I am certain, repay study.

1159. *Chairman*: To complete even nationalisation of these industries, according to your view it is essential to have control of large quantities of raw materials?

Lord Marley: It is a matter of being able to secure that the raw material is available; that is what it really amounts to. I would not maintain, for instance, that we should necessarily include Sweden in the British Empire in order that we should have that Swedish steel. That would be contrary to the Covenant of the League of Nations, and I would not advocate that; but there is no reason why, as far as steel goes, we should not have the same arrangement with Sweden, or any other country, as an ordinary private manufacturer has.

1160. *Chairman*: But take iron ore in this country. You do not go so far as to say, "Well, we will nationalise all the iron ore in the country." You say, "We will do something rather short of that; we will control it sufficiently to enable us to nationalise the armament steel manufacture?"

Lord Marley: It is quite true that the people of this country are not yet educated up to require the nationalisation of steel production, but the British Government would be a manufacturer, and just as any other manufacturer does it would make its contracts with the ore-producing companies. But we go a little further than that, and we say that we as the British Government have the right to priority

in the claim for the best ore. After all, we claim it is in the national interest that our people should be defended, if you put it that way. We claim the right to have the best ore, and to have the particular commodities we desire. We are prepared to pay for them.

1161. *Chairman*: You understand, I am not criticising, but I just want to understand what it is that is being put forward. Now may I go to another point, in Chapter 3 of Part IV of the Statement of Evidence. Under the heading, "(3) Explosives, Ammunition and Intermediates," the third paragraph begins. "The manufacture of explosives covers a very wide field of chemical effort." You see, it is dealing with the production of what are called intermediates. "The manufacture of explosives covers a very wide field of chemical effort, much of which is completely free from any suspicion of interest in the supply of armaments. These factories and processes are those which deal with the manufacture of intermediates, or of materials which are near relations of those in the explosive groups." Then, omitting the next paragraph, it goes on: "The range of industries engaged in the production of chemicals which are intermediates for explosives is wide enough to embrace gas works, coke oven plants, and soap works in addition to chemical works proper, and to the factories engaged in making shell." Then it goes on, on the next page, the fourth paragraph on the left hand column: "It would appear reasonable to assume that any efficient organisation for military purposes would base its arsenals upon the use of the intermediate re-agents rather than upon the building up of an inelastic factory in which all the processes were carried through from the raw materials." Now you see the intermediates are said on the first paragraph on the right to include gas works, coke oven plants and soap works; but is it suggested in this next paragraph that the Government control for this purpose should include what are called intermediates, or included in intermediates?

Lord Marley: In that connection, these intermediates are obtained from factories—we will call them factories for the moment—which are producing material which is close to war material and could by a slight modification be applied to the production of war material; and therefore our contention is that from the point of view of saving money it is much cheaper to use these, what I might call intermediate factories, when the time comes rather than have special factories which would lie idle, and which might get out of date, but which would only be used when the time came to need them. That is the contention. Now the method of control—

1162. *Chairman*: But wait one moment. Is there to be no control during peace time, and only nationalisation in the event of emergency?

Lord Marley: That is the case with all these intermediate re-agent factories.

1163. *Chairman*: You are not suggesting the control of soap production in peace time?

Lord Marley: Not of soap. We do not suggest that; but there is a factor which comes from soap which is essential during war, and therefore we should control soap then. But however desirable that may be in other directions—soap is a very essential thing even in peace time—we do not propose that we should take over the control of soap in peace time.

1164. *Chairman*: Or gas?

Lord Marley: Well, gas is already very nearly taken over, Sir John, because the majority of gas works are municipal undertakings, and are therefore to that extent already nationalised.

1165. *Chairman*: I understand. The question was whether the suggestion here was that there should be any sort of control over these intermediates during peace time, and I understand you to say "No"?

18 July, 1935.]

Lord MARLEY, D.S.C., J.P., D.L.

[Continued.]

Lord Marley: The control would be only to this extent. It would be, as already exists, in the public law of this land. It would reserve to the nation the right to control in time of national emergency.

1166. *Chairman:* The reason I ask that is this. Will you turn to the ninth page of Chapter 3 of Part IV,* at the bottom of the left-hand column, the last paragraph but one. It begins:—

“Our problem will therefore be to separate (1) those industries supplying direct war material; (2) those capable of immediate interchange to war material; (3) those supplying intermediate products to existing armament firms; and (4) that part of the chemical industry which is only indirectly related to warfare production.

After consideration of these matters, the practicability of control will be discussed, and the problem is here complicated by the widespread control of certain of the large firms, who are at present engaged in producing explosive and pacific materials. Control may demand a spread to include sales services to the pacific industries of relatives of explosives, and in such cases as glycerine production to the control of soap factories, which are essentially suppliers for pacific uses”.

Now that does seem to suggest control of factories during peace time. Is that right?

Lord Marley: Well, only to this extent, that the factories enumerated, namely gas and soap, are not normally in peace time supplying all the by-products of their factories to the producers of war material at present. In other words—I think I am right in saying it, but perhaps I ought to be advised on this—the normal municipal gas works is not supplying any large portion of its spare products to explosive manufacturers, and I am not quite certain of this, but I think that the soap works are not normally supplying their by-products in peace time. It is only when the emergency of war demands it that there is this increase in production.

Sir William Jovitt: I am told you are quite wrong.

Lord Marley: Let me then stand corrected, Sir John, in this. May I ask Mr. Bernal to put you right?

1167. *Chairman:* We will give you a moment or two for reconsideration.

Mr. J. D. BERNAL, M.A., recalled.

Mr. Bernal: Well, Sir John, as far as this last point is concerned, just to get it clear, one of the main bases of course for explosives is glycerine, and of course all the glycerine does come from the soap works. All the glycerine needed for explosives used in peace time, to the extent of some hundreds of thousands of pounds a year, comes from the soap works, and in the same way suppliers of the other by-products which are the basis of explosives, picric acid, trinitrotolol, and so forth, are the gas works, and they all come from gas works in peace time; and of course there are much greater demands in war time.

1168. *Sir Philip Gibbs:* Are they under government control in peace time at all?

Mr. Bernal: Neither of those are under control in the sense of actual control of operation, but the government has a control first of all over all patents, that is, they have the right, as Lord Marley pointed out, of having a prior use of all patents connected with the chemical industry, and also I believe there have been arrangements made by which chemical factories are transformable to war purposes. I cannot say anything about the nature of those arrangements; the Commission of course could find those out.

1169. *Sir Thomas Allen:* There would be no need to control soap works, either in peace or war time, in order to get the glycerine, would there?

Lord Marley: I think you would have to control them in war time.

1170. *Sir Thomas Allen:* Not necessarily in war time because in war time the only object of controlling the soap works would be to produce more soap to produce more glycerine; but the government can produce glycerine at any time without controlling the soap works.

Lord Marley: And of course there is the question of price. We have got to protect the nation.

1171. *Sir Thomas Allen:* The price would naturally have to go up if you produced more soap than was required in order to get glycerine.

Professor Gutteridge: But surely it is not necessary to produce soap in order to get glycerine. I myself produced glycerine during the war from dead mules and all sorts of things.

Lord Marley: I am afraid I am not an expert on that.

Might I just refer for one moment to the gas companies. I think it is important to realise that the by-products of these companies—I think I am right in this—are disposed of purely on a commercial basis. There is no control at all at the present moment. They sell these by-products to whoever buys them, and there is no control, and I do not think the government has any special rights over them, bar the patents mentioned by Mr. Bernal. It is simply an ordinary commercial basis.

1172. *Chairman:* On the eleventh page of Chapter 3 of Part IV,† at the bottom right-hand column, it says: “The safety of the industry does therefore depend upon a wide control of many processes, in order to minimise the effects of such reactions, and the more effective the organisational control is, both in management and in sales agreements with ancillary industries, the more stable it will become. This survey brings out clearly the fact that the lethal substances and the explosives section of the industry can, with the exception of the type of product mentioned, . . .” I want to know what are the types of products mentioned. I cannot trace anything which would enable me to identify those exceptions.

Mr. Bernal: . . . “the exception to the type of products mentioned” refers, I think, mainly to chlorine and phosgene, which are commercial products, and can also be poison gases. They need special treatment.

1173. *Chairman:* There is one more passage I want an explanation of, please. It is on the 5th page of Part VIII,‡ in the middle of the bottom left hand paragraph on that page: “The technical discussion given leaves no doubt that we can separate these sections”—that means that armament section by itself—“However, we are of opinion that the complete nationalisation of the iron and steel industry is the only valid method”—I suppose “valid” there means effective?

Lord Marley: I suppose so, yes.

1174. *Chairman:* However, it does not very much matter—. . . “the only valid method of approach, because even if the armament section is nationalised, the position might arise in which this section dealing in highly specialised products would be under the control of a complete iron and steel trust which would be suppliers of the fundamental material for such products”. That is only again emphasising that you must have control of the material products in order to make your nationalisation of the armament industry effective?

Lord Marley: Yes. It is bringing out a possible difficulty which must be borne in mind in the recommendations which are made.

1175. *Chairman:* Very well, thank you. I am afraid I have been very troublesome, but I wanted to understand exactly what the position was.

Lord Marley: With regard to that last question, if you will turn to the continuation of that paragraph from which you quoted, you will see that we then deal with that particular difficulty which we mention. It begins: “The type of control suggested must be safeguarded against such a state

* Appendix, p. 189.

† Appendix, p. 191.

‡ Appendix, p. 210.

18 July, 1935.] Lord MARLEY, D.S.C., J.P., D.L., and Mr. J. D. BERNAL, M.A.

[Continued.]

of affairs. This could be achieved . . ." and so on. 1176. *Dame Rachel Crowdy*: Lord Marley, Sir William Jowitt yesterday presented some proposals in connection with the licensing system. They are referred to in Part VII of your printed statement, and again at the end of the statement. Does the Union of Democratic Control not feel that most of those proposals, the major part of them, anyhow, are included in the American draft convention which is being discussed at Geneva? I have been very interested in the presentation of your case yesterday to find how little reference has been made either to the American draft convention or to any of the proposals that are being put forward in Geneva by the various governments and by the League staff itself during the last few years. I should like to ask whether, in the opinion of the Union of Democratic Control, if that American draft convention were accepted by the majority of the countries that matter, and if military aircraft as defined under the convention were controlled, a very large number of the difficulties we are discussing here today would not be put an end to?

Sir William Jowitt: I think, Dame Rachel, there is no doubt that the Union would say that if the American draft convention were adopted in its integrity we should consider that a very great stride forward would have been made—a very great stride. 1177. *Dame Rachel Crowdy*: And the Union would support the Government in that action?

Sir William Jowitt: Yes; and we very much hope that as a result of this evidence before this Royal Commission, if nothing more, the British Government may reconsider the attitude they took with regard to those proposals.

1178. *Dame Rachel Crowdy*: I could not find in your Statement of Evidence itself, or hear yesterday, that you defined military aircraft in any way. Have you in your own mind a definition, or do you accept the definition in Category III of the American draft convention? It is really most important, and was one of the most interesting discussions at Geneva. It affects the whole question of whether civil aircraft can be converted into military aircraft during a war.

Sir William Jowitt: I do not think there is any better definition that I can think of, or better scheme of separation than that indicated in the American proposals.

1179. *Dame Rachel Crowdy*: May I just read the definition as it is here? It is very short. It says "Air Armaments"—that is one of the categories which would be controlled under the convention—"1. Aircraft, assembled or dismantled, both heavier than and lighter than air, which by reason of their design or construction are adapted or intended either for military or naval reconnaissance, or for aerial combat by the use of machine guns or artillery, or for the carrying and dropping of bombs, or which are equipped with or prepared for any of the arms or appliances referred to in paragraph 2 below.

2. Special guns and machine guns for aircraft, and their gun mounts and frames. Bomb racks and torpedo carriers, and bomb or torpedo release mechanisms."

Lord Marley: That is a very wide definition. There are very few aircraft which would not come under that.

1180. *Dame Rachel Crowdy*: Is that accepted by your organisation? Are you to be understood when you speak of military aircraft as roughly meaning that?

Lord Marley: If you rely on that definition to cover military aircraft we shall be satisfied.

Mr. McKinnon Wood: Might I add that that would go a very long way but I think it is possible for absolutely civil aircraft to be used for highly offensive military purposes.

1181. *Dame Rachel Crowdy*: Not for fighting purposes but for use as bombing aeroplanes?

Mr. McKinnon Wood: Yes, not for aerial fighting but for attacking a city and bombing indiscriminately, with explosive bombs and poisonous

gases. For that purpose even a small aeroplane is quite useful.

1182. *Dame Rachel Crowdy*: They are easily convertible?

Mr. McKinnon Wood: That can be done even without conversion.

Lord Marley: That definition covers that I think.

1183. *Sir Kenneth Lee*: In order to get it on the record could Lord Marley tell us the membership of the Union of Democratic Control?

Lord Marley: The number of members?

1184. *Sir Kenneth Lee*: Yes.

Lord Marley: I am afraid that at the present moment, without going through our files, it would be impossible to say. We could send you a letter giving that information.

1185. *Sir Kenneth Lee*: Approximately; I do not mean exactly.

Lord Marley: That letter will be sent. We can give you then the exact figures and we shall give you the membership of Committee and all the rest of it.

1186. *Sir Kenneth Lee*: I was only wanting a general figure.

Lord Marley: We would rather not give a figure without looking at our index.

1187. *Mr. Spender*: Since expenditure is rather an important point in this matter, could you answer one question? Do you propose to compensate the owners of shares in munition concerns in the event of nationalisation or taking over?

Lord Marley: That would be a matter for the government dealing with the problem to decide. We cannot say in advance what policy a government which nationalises an industry would adopt.

1188. *Mr. Spender*: It is rather important for us to have some kind of knowledge of what is proposed by people advocating these changes.

Lord Marley: We are not proposing to be the government.

1189. *Mr. Spender*: We have had an answer to that question from the Independent Labour Party. Mr. Fenner Brockway said he did not propose to compensate beyond giving a "dole" to distressed shareholders. Is that the view of your Union?

Lord Marley: That is the reason why I brought out a few minutes ago that we are not a political body. We do not pretend to have a political solution for all our problems. We believe this, that nationalisation as far as it can go is advisable and necessary but we believe that if the government of to-day had the commonsense to adopt our proposals they would have enough commonsense to work out the details under which they would nationalise.

1190. *Mr. Spender*: I suggest to you that "commonsense" would depend not a little on the amount of money which would have to be expended.

Lord Marley: That would be a matter for the government.

1191. *Mr. Spender*: You are not prepared to offer any advice?

Lord Marley: It would be no good my giving you my individual opinion.

1192. *Mr. Spender*: The opinion of the Union is what I mean.

Lord Marley: The Union is not a political body.

1193. *Mr. Spender*: It has no views on that subject?

Lord Marley: It may have views but it does not express them in connection with these principles, because we know that there may be quite a number of solutions. We might have a National Government, or a Conservative Government, or Mr. Lloyd George might come back, or Mr. Harry Pollitt or other people.

1194. *Mr. Spender*: But you put forward a very comprehensive scheme of change, of which one of the material factors must be expenditure, and you say you do not advise us on the amount of expenditure which may be incurred and in which compensation is a very material factor.

18 July, 1935.] Lord MARLEY, D.S.C., J.P., D.L. and Mr. J. D. BERNAL, M.A. [Continued.]

Lord Marley: I may say that we have very great reliance on the Royal Commission and we are perfectly certain that if they feel that a broad scheme of nationalisation is desirable they will be able to devise the type or the method of compensation, if any. . . .

1195. *Mr. Spender:* If any?

Lord Marley: Yes—which should be applied.

1196. *Mr. Spender:* I cannot take it further than that, but I should like just to ask you about one more point. You speak somewhere of the importance in this matter of the pressure of opinion which is brought to bear on governments. You tell us somewhere in your evidence about "those who make a living by the manufacture of armaments". Would that pressure be likely to be altered if governments had the monopoly in the manufacture of armaments, because the number of those who make a living at it would not be substantially altered? You say in one part of your evidence that 170,000 people are employed in the chemical industries, and, of course, there would be an immense number employed in iron and steel and the subsidiary interests and in the dockyards. Do not you imagine that the pressure might only be transferred from one set of people to another set of people?

Lord Marley: In that connection I happen to have some personal experience, by reason of the fact that I have fought constituencies including Royal Dockyards, and I was Secretary of the National Committee on Royal Dockyards—the political committee—and my experience was that in the great dockyard centres, Plymouth and Devonport, Portsmouth, and Chatham, Sheerness and Woolwich, in those dockyard and arsenal centres, the workers, whose whole life was bound up with the prosperity of the firms in which they had invested their lives, were the very people who opposed war, and who demanded a pacific policy on the part of the government.

1197. *Mr. Spender:* I quite follow that; but at the same time it is not always easy in electioneering to put two and two together. My own experience—and I have had some, and have seen dockyard constituencies as well as others—has been that there has been great pressure on the members for dockyard constituencies to keep the estimates high for the construction of the particular armaments that are being made in the dockyard.

Lord Marley: That is not my experience. The pressure that I came across during a good many years experience in this connection was much more of pressure to demand that the allocation of orders for new material, orders for repairs, and orders for spares, should be reasonably divided between the Royal yards and the private yards; and the Royal yards, very naturally, put forward this factor, that if the production allocated to the Royal yards were diminished, it would mean high overhead expenses when they were not being utilised to the full, and in consequence it would be made to appear that the public yards cost more to produce a given article than did the private yards. That was the pressure that was brought; it was on the lines of efficiency.

1198. *Mr. Spender:* It would take that form, that "a proportion should be allotted to us"?

Lord Marley: Yes; and I may say—and I want to emphasise this and am glad you asked this question—that my experience was that the feeling amongst those people was to oppose high estimates, and that feeling was very strongly voiced in the dockyard towns. It was a very remarkable phenomenon.

1199. *Mr. Spender:* That is, in the perfectly general terms in which peace resolutions are naturally and rightly put forward; but I would just ask you to consider that we have had specific instances to the contrary of what you are suggesting, and that great pressure was brought to bear, I remember, on the Labour Government to build five cruisers. That

is an example of a great deal of the sort of pressure that goes on.

Lord Marley: You are referring to 1924?

1200. *Mr. Spender:* Yes.

Lord Marley: I was fighting a division then in the immediate neighbourhood of Portsmouth. I spoke at a good many meetings in Portsmouth at that time, and my own experience was that when I opposed high estimates for the services I got a very widespread body of support behind me among the dockyard workers.

Mr. Spender: I should not question that, but I simply suggest a particular experience to show how great the pressure was now it has been brought home to all of us who have been concerned in these matters.

1201. *Sir Philip Gibbs:* Are you familiar at all, Lord Marley, with the functioning of the Ministry of Munitions during the War?

Lord Marley: I am afraid I was only a user of the products.

1202. *Sir Philip Gibbs:* For instance, did you read Dr. Addison's evidence and the statement he put in before this Commission?

Lord Marley: I read a summary of it. I am afraid I did not read every word.

1203. *Sir Philip Gibbs:* I was wondering, for instance whether you would agree that during the War the Ministry of Munitions did actually exercise a control not only over the manufacture of arms and explosives but also over the raw materials which were necessary.

Lord Marley: I am afraid I have not got the technical knowledge to say about that.

1204. *Sir Philip Gibbs:* It was rather in favour of your argument as a matter of fact; but I think we have got all we wanted from Dr. Addison, and that is that the Ministry of Munitions did actually control the sources of supply of steel for guns and poison gas and so forth.

Lord Marley: Yes, I understood that, but I did not know it of my own knowledge.

Sir Philip Gibbs: Therefore I was going to ask you whether you would say that such a thing could happen in peace time as well as during war. I was wanting your views on the subject. Of course, we think that there should be no difference in peace and war in obtaining the maximum efficiency in every direction. If a thing is necessary in war we cannot see why it should not be necessary in peace.

1205. *Professor Gutteridge:* I am not quite sure that I followed one thing about this. You were referring to a service between New York and Los Angeles. That is a private enterprise, is it not?

Lord Marley: Purely.

1206. *Professor Gutteridge:* How does that help your argument?

Lord Marley: The point is, it is subsidised by the American Government.

1207. *Professor Gutteridge:* But it is carried out by private people?

Lord Marley: Yes, but only because they get an enormous material subsidy from the United States Government, or did up till quite recently.

1208. *Professor Gutteridge:* In other words, if that is so, what we ought to do is that our Government ought to subsidise commercial aeroplanes?

Lord Marley: I would not be against it, so long as we were getting value for it.

1209. *Professor Gutteridge:* I wanted to see what was in your mind, that is all.

Lord Marley: What is in my mind is that in this country commercial flying has been allowed to drop so far behind the state of affairs that obtains in other parts of the world because it has been left entirely to uncontrolled private enterprise, and that commercial flying is about 20 per cent. of all our aeroplane production in this country. And we believe that the other 80 per cent. has been allowed

18 July, 1935.] Lord MARLEY, D.S.C., J.P., D.L., and Mr. J. D. BERNAL, M.A.

[Continued.]

to get equally behind; and in the national interest, if you have got to have air forces, we believe they should be efficient.

1210. *Professor Gutteridge*: But there is no need to nationalise it, surely, for that purpose. The Americans have not done it. Why should we do it? I merely make that observation, because everything depends, does it not, on whether we come to the conclusion that state enterprise or private enterprise is the more efficient?

Lord Marley: But of course you have to remember that while we have left it as it is in this country, we are behindhand, and you have to remember that in the United States there arose, as a result of this system of subsidy, some of the most extraordinary scandals in connection with the inflation of shares and the mail subsidies which the world has known.

1211. *Professor Gutteridge*: Yes, I remember the incidents to which you refer.

Lord Marley: That corruption is the sort of thing that we are against. You may get enormous expenditure of public money, and you may get an efficient force, and you may get terrible corruption. You may get no expenditure of public money, an inefficient force, and no corruption. But if you want efficient aeroplanes and no corruption, you have got to nationalise your industry.

1212. *Professor Gutteridge*: The only point that I wanted to get at was that it seems to me that the point you made about the American aircraft applies equally to the private control of the industry?

Lord Marley: I say that under nationalisation you would get your efficient planes without the corruption.

Professor Gutteridge: Yes, that is the issue.

Chairman: Thank you, Lord Marley. I think that is all we wanted to ask.

1213. *Sir William Jovitt*: There was some question which Sir Philip asked about the figures of exports of explosives. I think I promised to try to get the figures. I gave the figure of £1,200,000 as the total export according to the Answer in the House of Commons. I have not myself seen the build-up of that figure. It would be very easy for you to get that from the Government Department concerned. Mr. Bernal has been looking into the League of Nations publications for the year 1934. I quoted the year 1934, and it seems a little difficult to reconcile those figures with the Government's Answer.

Mr. Bernal: The actual figures given in the League of Nations 1934 Report on the Arms Trade relate to 1932. Perhaps I might be permitted to forward some statistics to the Commission bearing on the point.

I might say, with regard to an answer to another question as to what countries were capable of providing explosives and chemicals for warfare, it turns out that the actual number providing them in any serious quantity is very small. There are only six countries in all that provide any substantial quantity of those. By far the largest is the United Kingdom, then the United States, France, Sweden, and Belgium. Germany of course is not allowed under the Treaty of Versailles—I am basing myself on the League of Nations figures—

1214. *Professor Gutteridge*: Is that why you exclude Russia, too?

Mr. Bernal: Russia does not export them. I am only dealing with exports. Then if we take Japan, the export there we know has been considerably increased in the last two or three years; and we can certainly add Russia to that list, and then I think we have the only countries which are capable of producing explosives or chemicals on a large scale. There is a list of roughly forty countries which produce no explosives at all for export. That includes the whole of Central and South America, and also several of the smaller European countries.

Sir William Jovitt: I am going to forward to the Commission letters dealing with two topics. One is our view as to the extent to which this high-class armament steel is used, apart from its fundamental use for armaments. If I can get you any information about that I will. The other is as to the question of the composition of the Union for which I am appearing. Of course, it falls under two heads: there are the individual members, and it is also a union of affiliated societies. For instance, the Royal Arsenal Co-operative Society, with 320,000 members, is affiliated to this Union, and other bodies of a like sort; but we will get you the precise figures and let you know. Thank you very much, Sir John.

1215. *Chairman*: Then we shall adjourn now. We do not propose to sit again for some considerable time: the holidays are intervening.

Lord Marley: Perhaps I might take the opportunity on behalf of the Union of Democratic Control of thanking you and the other members of the Royal Commission for the patience they have shown in hearing the rather voluminous and technical evidence we have submitted.

Adjourned.

APPENDIX

STATEMENT OF EVIDENCE SUBMITTED BY THE UNION OF
DEMOCRATIC CONTROL

PART I

Terms of Reference

The appointment of the Royal Commission on the Private Manufacture of and Trading in Arms has been made at an opportune moment, at the commencement of the greatest race in arms the world has known. It has an opportunity of advising the Government to take over the manufacture of and trading in weapons of war, thereby removing one of the powerful incentives to war preparations, i.e. the enormous profits made by the private manufacture of arms. The Union of Democratic Control at the outset would like to refer to the terms of reference for preliminary consideration.

Personnel.

The Prime Minister on 3rd May, 1935, stated, in reply to a question in the House of Commons:—

"There are no assessors or technical advisers at present attached to the Royal Commission. If the Commission desire such assistance, they will no doubt ask for it."

The Union of Democratic Control believes that it is essential to enlist the services of such experts. The case which they are putting forward has been compiled mainly by experts on various aspects of the industry, and technical advice will be essential for an adequate study of the problems which are involved. This is equally, if not more, the case with the evidence which, it is understood, will be given by the armament firms and by representatives of the relevant Government Departments.

For this reason the Union of Democratic Control suggests that the Commission should ask for this expert assistance for the purpose of examining the documents, books and factories of the privately owned arms and munitions industry. It is considered that Government Officials, e.g. Board of Trade Surveyors and Factory Inspectors would be among those who could provide this assistance.

Documents.

The armament firms and Government Departments in this country have had ample warning, and the Union of Democratic Control suggests that full advantage be taken of the terms of reference concerning documents.

The terms of reference on this point state:—

"We do by these Presents give and grant unto you, or any three or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission; to call for information in writing; and also to call for, have access to and examine all such books, documents, registers and records as may afford you the fullest information on the subject, and to enquire of and concerning the premises by all other lawful ways and means whatsoever."

The Commission will recognise that the Union of Democratic Control are not in a position to give detailed lists of all relevant documents but suggest that the Commission can obtain from the parties concerned a full disclosure of such documents. The Union of Democratic Control are however able to suggest to the Commission a few instances of the kind of documents for which inquiries ought to be made. These instances by no means exhaust the many descriptions which could be given of relevant documents. The type of information may be summarised as follows:—

1. *A complete list of arms and munitions factories abroad owned and controlled by British firms.*
 - (a) Their production and organisation.
 - (b) Their relations, if any, with government of country where situated, e.g., Resitza firm of Roumania, of which Vickers hold 27 per cent. of shares, and the Roumanian Government 60 per cent.
 - (c) Costs for representative arms and munitions supplied to foreign countries.
 - (d) Books showing production, and in the case of export the amount and destination, of arms and munitions made by factories abroad.
2. *Financial transactions with Foreign Governments.*
 - (a) A list of loans and their conditions with which armament firms were associated, e.g., Vickers and the Chinese loan.
3. *Documents showing the method of distributing contracts by the British Government.*
4. *Information on licensing system.*
 - (a) Full list of licences granted with names of firms and arms or munitions exported.
 - (b) Full list of licences refused. By whom demanded, and reason for refusal.
 - (c) Correspondence of armament firms with the Government Departments concerned, i.e., Foreign Office, Board of Trade, Admiralty, War Office and Air Ministry re export trade.
5. *British Officials abroad.*
 - (a) Consular reports re imports of British arms and munitions by country in which they are situated.
 - (b) Consular reports of exports of arms and munitions by foreign factories of British firms.
6. *Organisation of existing State Arsenals and Dockyards.*
 - (a) Their present capacity.
 - (b) Their capacity for expansion.
 - (c) Their methods of costing.
7. *Officials of Armament Firms.*

Agreements with leading officials, e.g., between Vickers Ltd., and Sir Basil Zaharoff and with Sir Charles Craven relating to military sales.
8. *Press Departments.*

Correspondence of the Press Departments of the main armament firms, especially of Vickers Ltd. and I.C.I. Ltd.
9. *Vickers and Krupps.*

Agreements between Vickers and Krupps relating to the use of patents during the War.
10. *Subsidies from Government Departments.*

Any arrangements with firms in lieu of a subsidy by which the firms receive the monetary effect of a subsidy, e.g., by the arrangement of a price which, over a period, includes what would be the amount of the subsidy for that period.
11. *Accounts.*

The armour plate control accounts of English Steel Corporation, Beardmore and Firth Brown with explanatory notes as to how the figures entering those accounts have been built up.

12. *Costings.*

The original cost sheets—

- (a) for armament production and prices charged to the Government;
- (b) showing how costs are made for armament work and for commercial work.

13. *Entertaining Expenses.*

Accounts of Abbey House, Barrow, and of such places as the Inspector's Dining Rooms at Sheffield.

Witnesses.

It is essential that the Royal Commission, assisted by experts, should hear witnesses representing every sphere of the industry, both on its manufacturing and on its trading sides. Further, witnesses should be called from the Foreign Office, the Board of Trade, the War Office, Admiralty, Air Ministry and Treasury.

Again, in order to assist the Commission, the Union of Democratic Control has compiled the following list of people who, it is suggested, could give indispensable information on one or another aspect of manufacture and trade.

*List of Witnesses.**Vickers.*

Mr. Reid Young (Secretary of Vickers Ltd.).
 Sir Charles Craven.
 Sir Basil Zaharoff.
 Lieut.-Commander Cummings.
 Mr. Douglas Vickers.
 Sir Mark Webster Jenkinson.
 Mr. Caillard.
 Mr. A. Dunbar (Commercial Manager, English Steel Corporation. Formerly Commercial Manager at Elswick Works).
 Sir J. A. Cooper.
 Captain Whyham (Gun mounting overseer at Barrow Works).
 Sir Otto Niemeyer.
 Mr. Horsman Bailey (Solicitor in London Office, Vickers, Ltd.).
 Rear-Admiral Patterson (Special Director, English Steel Corporation).
 Mr. W. L. Hichens (Cammell Lairds and English Steel Corporation).

Imperial Chemical Industries.

Sir Harry McGowan.
 Mr. H. J. Mitchell.
 Colonel W. N. Taylor.

Messrs. John Brown & Co. Ltd.

Sir Holberry Mewforth.
 Admiral Sir Reginald Bacon.

Armstrong Siddeley Development Co.

Air Marshall Sir John F. A. Higgins.
 Mr. Green (late Royal Aeronautical Establishment).

Fairey Aviation Co.

Mr. Charles Fairey.

Government Departments.

- (1) Inspectors of Admiralty, War Office and Air Ministry.
- (2) Government auditors.

Places.

The terms of reference of the Commission state:—

"And We do by these Presents authorise and empower you, or any of you, to visit and personally inspect such places as you may deem it expedient so to inspect for the more effectual carrying out of the purposes aforesaid."

It is suggested that the Commission, accompanied by technical advisers, should visit the main armament producing factories. Particular attention should be paid to the heavy armament industry and to that of aircraft.

In view of the arguments generally put forward by the armament manufacturers that their works are efficient, modernised and capable of rapid expansion, it is suggested that the Commission with one or more of their experts, inspect the Cyclops works of the English Steel Corporation, a subsidiary of Messrs. Vickers-Armstrongs and Messrs. Cammell Laird. These works are exclusively devoted to the production of armour plate and bullet proof plate, and are, we have reason to believe, typical of the heavy armament shops. It is suggested that the Commission note particularly the age and condition of the machines, overhead cranes and furnaces and that they make inquiries as to whether these works are now in an efficient condition, and if efficient for how long they have been in this condition.

The Union of Democratic Control is, of course, not in a position to know many of the facts which the Commission will no doubt desire to obtain and the case presented by the Union of Democratic Control is concerned to assist the Commission by putting forward such facts and suggestions as they can, feeling sure that the Commission will appreciate the inherent difficulties of presenting a complete case in the absence of many of the material facts and documents. Nevertheless the Union of Democratic Control are satisfied that the case which they put forward is supported by the material in their possession and that further disclosure of facts and documents will serve still further to support that case.

PART II

The Special Nature of the Armaments Industry

The Union of Democratic Control has never maintained that the private manufacture of arms by itself is the cause of wars. But the influence of the armament manufacturers in the years leading up to the war of 1914-1918 is now too well known to require elaboration. International affairs to-day bear a strong resemblance to that of the period immediately preceding the last war. The activities of the armament manufacturers are not only the expression of a deepening war situation, but they heighten the tempo of war preparations. The armaments race has begun. The pre-war race in naval armaments has its parallel to-day in the aircraft race. The situation is ripe for exploitation by those whose vested interests are in war and in war preparations.

The existence of the private industry in arms and munitions has created an enormous vested interest in war, in preparations for war, and in the state of international tension in which war is accepted as probable, if not inevitable. The financial aspect of the armament industries will be

described. Here it should be noted that it would be impossible, without access to the books of the industry, to make an approximate estimate of the capital involved on which profits have to be made in the interests of the shareholders. Even with access to such books there is the problem of division of capital in certain firms such as Vickers Ltd., into that which might reasonably be called armament capital and that which is used in non-armament work.

Nevertheless, it is hoped that the Royal Commission, on the basis of the documentary evidence they may have obtained at our suggestion from the industry, will consider this aspect of the problem, i.e., the enormous vested interest in the private manufacture of arms and munitions of war, and in those firms, covering a wide area of British industry, concerned with the raw materials of the armaments industry.

A survey of the shareholders lists at Somerset House shows that the entire capital owning section of the community is represented. All have an

interest in increased profits and increased profits can only come from the preparations for war or from war itself. This is one of the more undesirable features of the private manufacture of arms and munitions.

The most important category is the *international* armament makers, whose wealth and influence is incalculable. The second category consists of thousands of people in all ranks of life who, as lesser shareholders, play no part in policy, but benefit by the sale of arms.

All, however, draw their profits from the manufacture of and trade in arms, the profits of which run into an immense sum every year. During the period of the Disarmament Conference such profits have enormously increased particularly in aircraft companies and the present programmes of the National Government will lead to a continuation and further increase in such profits.

It may be argued that under the present economic system the investment of capital for the purpose of earning profits is a normal procedure. But some differentiation must be made between the arms industry and those industries which produce goods of commercial value. It may be useful to point out the fundamental differences between the causes of a demand for armaments and that for other commodities.

If a manufacturer wishes to extend the sale of his wares, both in this country and abroad, he advertises, tries to supply a better or cheaper article than his rivals, and generally tries to persuade possible consumers that they will get more value in use from their purchases than the money they will expend on them. The amount of the sales

which he can effect in this way depends partly upon the wealth of such consumers, partly upon his success in creating the opinion that it is important for or useful to the consumer to possess the article. But the demand for armaments differs in several respects from the demand for ordinary commodities.

1. A manufacturer of commercial goods who increases his sales in a foreign country does not, by so doing, increase his home demand; in the case of armaments he does. If an English firm builds destroyers and submarines for a foreign government this tends to lead to a demand for an increase in the British Navy.

2. A foreign manufacturer who increases sales in his own country, does not by so doing increase the demand for the commodity in our country, but in the case of armaments he does. If Krupps can persuade Germany to order more artillery, this leads to a demand for more artillery in England.

3. In the case of armaments the consumer is the state and has great wealth or resources; thus if the state can be persuaded that armaments are necessary, they will be bought whatever the cost. But however necessary commercial goods may be, a maker cannot increase his sales among the poor.

4. In the case of armaments the consumer is the state and the usual methods of advertising are not efficacious; they can, however, be replaced by the interested parties working up a patriotic agitation. Lord Snowden's speech on the Naval Estimates in 1914 made Members of Parliament aware of the way in which the scare of 1909 was managed.

Thus, whereas the interests of ordinary men lie in peace and security, the interests of those who live by the sale of arms and materials of war lie in fear, insecurity and ultimately, in war.

PART III

The Financial Aspects of the Armament Industry

It will be essential to discuss the financial aspects of the arms industry which is characteristic of and a strategic part of the present economic system.

Superficial simplicity.

The financial aspects of the armaments industries present an exterior which is superficially simple. There are a relatively small number of firms which claim to manufacture armaments, the great majority of them in conjunction with civil production. These firms present the familiar facets of the finances of capitalist industry. There are balance sheets of varying strengths, and profit and loss accounts, showing figures which, as a whole, are of amazing moderation. At the general meetings reference is usually made to the duty which the firm in question renders to the country for the production of weapons for the defence forces, and these references are frequently accompanied by complaints concerning the heavy competition to which the company is subjected both at home and abroad. Relations with the Admiralty, the Air Ministry or the War Office, as the case may be, remain like the relations with Foreign Powers in the King's Speech—friendly.

A careful study of the financial aspects of the armaments industry reveals that advantage has been taken of every nuance and complication that the company laws permit, and that so far from the picture being one of the essential simplicity of a number of direct manufacturers of goods, we are dealing with a complicated arrangement of trusts with their subsidiaries, financial and manufacturing, their cartels, their interlocking directorates and agreements stretched out and embracing a series of firms, banks and connections both at home and abroad which are largely unsuspected by the public at large.

Ingenious Accountancy.

It would, of course, be easy to present to the Commission classified data of the public companies which represent the "facade" of the industry. Such is the ingenuity of the practice of accountancy in this

country that balance sheets, details of capital, comparative profits, reserves, dividends, etc., covering a substantial period of years, all tabulated, can be presented to prove the innocence of the armament industry. Eloquent graphs could be drawn up to show the amazing rises in the values of armament shares at periods of public anxiety. The sensitivity of the Stock Exchange markets at the present time is an excellent example of this and the ruling prices of such shares as Rolls-Royce, Hawker, Fairey and Vickers might well be compared with the prices of the same shares two months back. But in truth these graphs would prove little but the intelligence of stock market speculators, while the corresponding falls in share values following the publication of pacific announcements by well-known statesmen are merely stigmata of bad news received by any market.

There is a class of speculative investor which regards purchases of such armament shares as Vickers, Imperial Chemical Industries, Hawker, etc., as legitimate insurances against the dangers accruing to peace-time investments during times of war, and any losses which may follow on the sale of these shares during a peaceful period are regarded as legitimate insurance premiums.

Balance sheets and profit figures are clearly valueless when dealing with trusts which are both vertical and horizontal. In such cases it is obvious that final profit figures and the payment of dividends may be sensibly diminished by the retention of substantial sums of money in the coffers of any one of the number of operating subsidiaries. Here the profits may be used for the purchase of property, stock or investments (frequently of an interlocking nature). The profits may promptly be written down in the subsidiary's balance sheet to a fantastically low figure, and safely hidden from the view of the investigator.

The Transfer of Profits.

A popular method of transferring profits from one subsidiary to another is by the internal sale

of raw materials or half completed goods where firms like Vickers are linked up with firms producing raw or half-finished products as in the case of the English Steel Corporation. The prices are calculated in order to show the profits at those points desired by the trust concerned, or alternatively at rates which are arranged in order to leave substantial profit margins during the progress of the goods through the trusts.

For instance nickel could be purchased by High Speed Steel Alloys Ltd. in which Vickers, through the English Steel Corporation has large holdings. High Speed Steel Alloys Ltd. would obtain this nickel perhaps through the Steel Manufacturers Nickel Syndicate Ltd., controlled by Vickers and other armament manufacturers, from International Nickel, a member of the Imperial Chemical Industries Group or else from S. A. le Nickel the French concern in which Vickers have large investments. This nickel is then sold to the English Steel Corporation who employ it in the manufacture of armament steel which is sold in a semi-finished condition to Vickers-Armstrongs, who turn it into the finished product.

A profit is made at each stage of this transaction and, in this instance, the Government are not favoured with the advantage of a rebate. This is concealed from them at the point where the nickel in its raw state is sold to the English Steel Corporation.

Hence a submarine purchased by the British Government from Vickers-Armstrongs would represent the profit to Vickers-Armstrongs, to the English Steel Corporation and to the High Speed Steel Alloys Ltd., etc. which are all linked up as part of the Vickers group with a number of directors common to all who will have fees from each concern.

Directors' fees.

Similarly the heads of the industries are able to recoup themselves by means of expense items drawn from the subsidiaries and by managing directors' commissions at each stage in the process of the trust. To the public their remuneration appears to be only a very moderate director's fee, and where they are also shareholders, the often meagre dividend payments which are published in the newspapers.

Such practices are the ordinary every day methods of business organisation, but our accusations are only general and are difficult definitely to prove without the right of cross-examination and the sequestration of the account books, ordinary and private, of all the companies with their subsidiaries.

Method of Investigation.

Faced with these difficulties it is necessary to abandon the ordinary methods of investigation and to attempt the unpleasant task of stripping from the skeleton of the armaments industry its flesh and of examining the bones, sinews, tendons and nerve centres which lie beneath. Realising that the figures could prove little of value in their very innocence, it has been decided to expose what are the true ramifications of the industry through its agencies, shareholders, debenture holders, interlocking directorships, control of marketing agreements and by the utilisation of a mass of miscellaneous information which needs registration under the laws of the land but which can only be pieced together as the result of immense and patient labour.

For example, it is necessary carefully to examine the records of a large number of private companies at Somerset House and it should be noted when using the Directory of Directors, that a number of gentlemen are careless in recording the details of some of their affiliations with private companies. Closer consideration however often exhibits a number of close connections between companies of an apparently unsuspicious nature.

The Shelter of Nominees.

The task is onerous and there is one difficulty which needs special mention. There is a common system in the financial world of registering large blocks of securities in the names of banks and individuals who are not the owners of the stock in question but only the nominees of the actual owners.

Such registrations, of course, often only indicate that the securities in question are being held by the bank as security against accommodation granted in the ordinary way of business, and in other cases the banks may have acquired the securities themselves, although it is sometimes difficult to differentiate between banks as owners and banks as nominees. But there is sometimes a more sinister application of this practice. The registration of large shareholdings in nominees' names may be carried out in order to hide from the public at large where the real control of the business lies.

Particular attention should be paid to such instances as where large blocks of shares may be found in the names of one or two gentlemen or ladies with a residence in some innocuous suburb such as: Mr. Smith, 23, Park Avenue, Tooting; where it may be found that although the shares are registered in these names, the control is safeguarded by the fact that the certificates of the shares, together with blank transfers, signed by the nominees, have been lodged with the real owners in order to safeguard their position.

It will frequently be found that a subsidiary may be owned jointly by two or three armament manufacturers, the majority shareholdings being in nominees' names, the various companies being only recognisable by other affiliations on the part of the directors.

Investigators should also take care to examine the implications of "voting" shares, a system whereby voting control of the company is often vested in a very small number of shareholders despite the fact that the large percentage of the equity capital rests in other hands. Outside the armaments industry striking examples may be found in such companies as J. Lyons & Co., Ltd., Carreras, Ltd., and Marks & Spencer, Ltd., and there is reason to believe that this commercially useful expedient has often been adapted to less innocent purposes in the armaments industry.

An interesting example of the means by which control is hidden is shown in the case of the Broadway Finance & Investment Co. This company was originally registered as the Electric Ordnance and Accessories Co., but in 1923 it was reorganised and practically the entire share capital registered in the name of two nominees who were officials of the Anglo-International Bank. The directors of the company were, however, all nominees of Vickers, though it is interesting to note that only in the case of one individual (Sir Mark Webster Jenkinson), is the director of this company noticed in the Directory of Directors.

The address was 34, Nicholas Lane. Thus anyone who saw in the shareholders of another company the name of the Broadway Finance & Investment Co. would not associate this company with the Vickers group. It is perhaps significant to note that recently the registered office of the company has been moved to Vickers House, 6, Broadway, Westminster, but in the return to Somerset House the address is given, not as Vickers House, but as 6, Broadway. Parenthetically, it might be observed that the title of the firm, the Broadway Finance and Investment Co. is derived from the street, the Broadway, Westminster, where Vickers offices are situated.

It may be noted that the unsatisfactory nature of concealed nominees and shareholdings has recently been realised and was adversely referred to in the House of Commons recently by members of all parties during the discussion of the commodities scandals.

Interlocking Directorates.

Another phase of great importance is the influence of directors who hold directorships on a number of boards. This is particularly significant in the cases where directorates are in the armaments industry on the one side and the banking world on the other.

In this memorandum and in the diagram which illustrates it,* references are made to the machinations of a number of financial firms, such as Glyn Mills, the Anglo-International Bank, the Bank of Roumania, the Ottoman Bank both in London and Paris, and such private banking houses as Kleinwort and Dawney Day and other well-known companies.

* Figure 1.

Armament Loans.

The linking up of the armaments industry and finance can also be observed in a study of loans made possible on conditions of reciprocity which bring profits to the armament firms and certain poverty with uncertain security to the countries accepting the loan.

Government Bond issues in fact occur in the scheme of armament finance in a quite unexpected manner. Thus the £1,803,000 Chinese Government 8 per cent. sterling notes 1925-1929 (China-Vickers Loan) were issued in 1919 by the Chinese Government to Vickers Ltd. in payment of certain aircraft and munitions of war. The details of these notes were communicated to Messrs. Vickers Ltd. through the good services of the British Minister in Peking and H.M. Foreign Office, and on receipt of these notes they were floated on the London Stock Market by Messrs. Vickers Ltd. so that the armament firm received, by this means, payment for their goods in cash. In 1921 Vickers Ltd. announced that the service of this loan would be paid out of the surplus Chinese salt revenues, but objections were raised to these payments by the International Financial Consortium in China with the result that no coupons have been paid since June, 1922, and the bonds are now quoted on the London Stock Exchange at less than one-fourteenth of their original value.

Thus, the general investing public were victimised and it would seem that the British Government of that period were largely to blame in allowing such a thing to take place. It is clearly improper that the British Government should be used as a method of financing the sale of British armaments to foreign powers, particularly when the British investor is called upon, in the long run, to pay eleven-twelfths of the price.

Financial Aspects of I.C.I. Ltd.

The attention of the Commission must also be drawn to the financial aspects of the munitions industry which means, in practice, to I.C.I. Ltd. I.C.I. is the principal manufacturer of small arm ammunition, of military explosives, of poison gas, and of practically all the component parts of chemical warfare as well as of many of the component parts of "defence" against poison gas.

It will be observed from the Imperial Chemical Industries diagrams* that there is a vast number of vital link-ups which bring in such names as the International Nickel Co., the Castner Kellner Alkali Co., Murex, British Dyestuffs, I.C.I. Metals, Kynochs, Distillers, du Pont de Nemours (The American Chemical combine), I.C.I. Explosives, Nobels Explosives, the Sedgwick Gunpowder Co., the Finance Corporation of Great Britain and America, the General Motors, and finally, the I.G. Farbenindustrie who are the principal manufacturers of chemical warfare materials in Germany.

Taking into consideration the greater efficiency with regard to rationalisation and general operation which characterises the I.C.I. group as operated in comparison with the Vickers-Armstrong group, it may be taken that all the remarks which have been made with regard to links, shareholdings and controls in the Vickers-Armstrong group will be found to apply equally to the I.C.I. group. Obviously the members of the Commission will have already made themselves familiar with that part of the public evidence from the American Senatorial Inquiry on the Armaments Industry which deals in such great and revealing detail with I.C.I. and more especially with its international ramifications and agreements.

Aircraft Finance.

Special attention should be paid to the financial aspects of the race in aircraft which is an outstanding feature of the armaments race to-day. Compared with the trusts which have been shown heretofore, the aviation industry in general provides at the moment a fairly simple field of investigation.

In truth the aviation industry is at very much the same stage as the chemical industry was 25 years ago, and the heavy armaments industry 50 years ago.

There are signs to-day of agreements between the leading firms such as that between Armstrong-Siddeley and Hawker Aircraft by which the resulting company, the Hawker-Siddeley Co., represents the first big military aircraft merger.

The speculation which now marks the shares of the public aircraft companies is very similar to the speculation which took place in the shares of the heavy armaments firms in the great naval race which preceded the last war, and since it is obvious that a great expansion is about to take place in the British Air Force, a large amount of financing will be required in order to fulfil the contracts which will be placed. Thus the aircraft industry is, at this moment, entering a stage in an air armaments race with all the accompanying possibilities of financial exploitation by irresponsible and unsocial interests.

Competition is being unnecessarily sharpened by means of the interposition of the company promoter. Issues of shares have been made during the past six months based on an estimation of inflated profits, and by the utilisation of a favourable "Bull" market these shares have carried to substantial premiums.

The attention of the Commission is drawn to the recent issues of British Aircraft, General Aircraft, Airspeed, Phillips & Powys, and Parnall Aircraft as instances of the essentially undesirable state of affairs.

All aviation shares are standing at probably unjustifiable levels, the ramp is based upon the expectation of government fed demand and it is particularly appropriate that this moment should have been chosen for the appointment of a Royal Commission "to consider and report upon the practicability and desirability . . . of a prohibition of the private manufacture of and trade in arms and munitions of war and the institution of a State monopoly of such manufacture and trade."

With the memory of the part played by the heavy armaments industry in the armaments race of 1905-1914 it is the Commission's good fortune to prevent the profit motive from exploiting the present unhappy situation in international affairs.

The Work of the Royal Commission.

No member of the Commission can have any doubts as to the important influence which high finance has exerted in the sphere of international affairs. The inter-connections of high finance and the armaments industry have already been exposed, but this is the first time that the unholy triangle of politics, arms and finance has been brought into high relief. Whilst regretting the intense labour that would be caused, it must be pointed out that the Commission's labours would be largely useless unless it is prepared to investigate the implications, to the fullest degree, of international banking in its relation to armaments.

It is not necessary to suggest to the Royal Commission that they will need for this work the assistance of expert and trusted accountants since such investigations must go far beyond the books of the companies concerned and must include the examination of the innermost workings of a number of banks and finance houses. We would suggest that such action should be taken quickly in order to avoid the possibility of such firms, banks and finance houses hiding or removing from the country vital evidence. Already too long a warning has been given. It must be emphasised that since in the past the corrupting influences of the heavy armaments manufacturers have been far reaching, it is essential that the Commission should avail themselves of the services of independent accountants in the honesty and accuracy of whose work they, and the public at large, can be assured. Only on this basis can the adequate study of this problem which is so essential at the present time be undertaken by the Royal Commission.

* Figures 2A and 2B.

PART IV

The Armaments and Munitions Industry

INTRODUCTION.

The Union of Democratic Control has always fully realised and admitted the extent and the complexity of the problem of the private manufacture of and trade in arms.

It has made a detailed study of this problem and wishes to place the results before the Commission. For this reason, and believing that some such detailed information will be essential to the Royal Commission, it has prepared four chapters dealing with the industry:—

- (1) Chapter on the iron and steel industry in those aspects relative to the production of armaments.
- (2) Chapter on the heavy armaments industry.
- (3) Chapter on the chemical industry in those aspects relative to the production of explosives and poison gas.
- (4) Chapter on the aircraft industry.

CHAPTER I.

THE IRON AND STEEL INDUSTRY.

The Iron and Steel Industry, taken at the stage when iron passes into steel, is divisible vertically into different processes, distinct to the extent that a firm may engage in one process only.

In order of occurrence these stages are:—

1. Production of Pig Iron from Iron Ore;
2. Steel Melting;
3. Working of Steel;
4. Machining.

The only important exception to this order is concerned with Steel Foundry Work, when the steel is cast into a more or less finished state, and is only subjected in a minor degree to machining, for the removal of surplus metal, rough edges, etc., and the drilling of holes for assembly purposes. It is intended to show below that these processes are distinct from (a) a geographical point of view, and (b) a technical point of view.

(a) Geographical.

1. The principal areas for the production of pig iron are those situated near iron ore beds, the blast furnaces in many cases being situated at the mouth of the iron ore mines. These areas are Lincolnshire, Northamptonshire, Cleveland, Cumberland, Clyde Basin, South Wales, Derby and Notts., and the Black Country. Of these, Cumberland produces by far the best quality pig iron—haematite—a type essential for the production of high grade steel made by the acid open hearth process.

2. It is a peculiar feature of the British Iron and Steel Industry that the district producing the heaviest and best grade steel products—Sheffield—is not an iron producing centre. Whilst Sheffield itself is responsible for some 15 per cent. of British steel output, the counties of Lancashire and Yorkshire, omitting the Cleveland and Barrow areas, produce only about 6 per cent. of the pig iron. The highest quality steels of Sheffield depend upon haematite pig iron and iron ore, the products of Cumberland, Sweden and Spain, and Sheffield draws from the coast all its raw materials except fuel. The coal of South Yorkshire is very suitable for steel making, but apart from this Sheffield has no economic advantage in the production of high grade steels over the remainder of the country.

3. The usual procedure in the Steel Industry is for processes 2 and 3 to be combined in one works, but there are many exceptions to this rule, and a considerable sale of ingots is made between different firms. Moreover, the steel firms themselves may transport the ingots manufactured at one works to a works situated in another area for subsequent working there, but a much more important trade is done in the re-rolling of partly worked steel in

such districts as South Wales and the Cleveland area. Billets and bars of steel are imported and are rolled into smaller sections, either as bars or sheets. Sheffield also has a fair trade in re-rolling, the usual procedure being to buy the steel after it has been partly rolled in order to ensure that it is of sound quality, and that no returns will have to be made to the vendor.

An example of ingots being passed over to another company is instanced at Rotherham, where the firm of Steel, Peech and Tozer pass a substantial proportion of their ingots to a subsidiary company, Templeboro' Rolling Mills, who then roll the ingots down into wire. Therefore, although it is the custom for these two processes to be associated, it is by no means essential that they should be so.

4. Sheffield is not a self contained engineering centre, although it is responsible for the production of much high-class engineering steel. At one time it used to draw 80 per cent. of its machine tools from the Manchester area, and the tendency has been of recent years for a bigger proportion of steel to leave Sheffield for machining in other areas more renowned for their engineering skill or more suited for the assembly of finished parts. Many of the big motor companies draw their supplies from Sheffield, receiving the steel in a worked condition, and ready for final machining operations. The English Steel Corporation passes many forgings over to Vickers-Armstrongs in Newcastle for subsequent machining and sales of forgings are made to the Admiralty for machining at Woolwich Arsenal. On the other hand, Sheffield buys a certain amount of lower grade steel from other parts of the country, or even abroad, and either performs further formative work upon it or else completes the machining.

It will be seen that from the geographical point of view the steel industry is already divided into the stages referred to above, and there is no reason why this specialisation could not be carried further, if it were desired. On the other hand, certain firms combine all these operations in one works, but for the most part these are large firms engaged in the production of low-grade steels, and it is difficult to foresee an armaments firm large enough to make such an undertaking.

(b) Technical.

1. As a blast furnace must be kept in production when once fired, it is very few steel firms that are large enough to absorb the output of a single blast furnace, much less a group of furnaces, so one finds for the most part that only those steel firms producing structural steel and steel for ship-building purposes possess their own blast furnaces. The remaining blast furnaces sell their pig iron to the numerous steel companies who do not directly own their source of raw material. As the production of pig iron is so distinct from the steel operations, it is not proposed to discuss any technical details, but fuller remarks will be made upon the other processes.

2. Steel melting may be undertaken in a variety of ways, the cheapest method being to blow a blast of air through molten iron, but for good class steels the choice lies between melting by gas in an open hearth furnace, or by electricity, in an arc or in a high frequency furnace. For armament work the Government often specifies steel made in an acid open hearth furnace, and this is the type of furnace largely favoured by the big armament firms.

The other open hearth process—basic open hearth—is similar to the acid process as to equipment and methods, but it varies in its chemistry and a slightly inferior steel is turned out in a shorter melting time.

For the production of steel in an open hearth furnace—either acid or basic—raw material consisting of scrap steel, and pig iron is mechanically loaded in to the furnace and, by a combination of heat and chemical processes, is converted into steel. The type of steel required determines the materials

charged into the furnaces, better raw materials being used for high grade steels than for the usual commercial types. There is also a choice to be exercised in the proportion of scrap steel to pig iron, partly influenced by the relative market prices. The practices of different firms vary as their requirements, but the average is some 75 per cent. scrap and 25 per cent. pig iron. For the year 1892 the National Federation of Iron and Steel Manufacturers' Statistical Year Book gives the following figures for the production of open hearth acid steel.

	Tons.	Proportion.	Per cent.
Pig iron used ...	387,100	6.90 cwt.	30.5
Scrap used ...	823,000	14.66 "	65.0
Ferro - manganese used.	14,800	.26 "	1.1
Other materials (iron ore included).	42,600	.76 "	3.4
	1,267,500	22.58 "	100.0

Ingot and castings 1,122,800 20.00 cwt.

produced. Per cent.
Yield ... 88.6

A further net division relating to those firms producing 93 per cent. of the total acid steel production for that year is of interest.

Material consumed.	Tons.
Own Pig Iron ...	77,600
Bought Pig Iron ...	268,000
Own scrap ...	254,200
Bought scrap ...	473,300
Ferro-manganese ...	13,700
Other material (includes iron ore)	40,900
Total used ...	1,127,700
Total made ...	999,900

The manager of the steel melting department or a technical assistant predetermines the quantities and qualities of material to be charged, and issues instructions as to when various additions—if the steel is to be an alloy steel—shall be made. Various samples are taken during the "melt" to ascertain the percentages present of the different elements, and at the correct stage the additions or finishings are added. For example if a 34 per cent. nickel steel is being made and a small sample shows that there is a shortage of nickel, then further additions have to be made. A calculation would be made by the laboratory assistant as:—

	Lbs.
Weight charged ...	117,300
Nickel required ...	4,200
Nickel found (3.05 per cent.) ...	3,577
Raw nickel to be added ...	623

and the nickel would then be added. If the alloy is of a type that a large proportion of it would be lost if allowed to stay long in the bath of "boiling" metal, then it is added immediately, before the furnace is tapped (or drained) into the ladle, or thrown into the ladle itself. After the molten steel has been run into the ladle it is then poured into ingot moulds (as liquid jelly is poured into moulds), the size and shape of the mould again being determined by the destination of the steel. If the ingot is required by the armour plate department, then it may be 50 tons in weight, for the forge up to 200 tons, or for the rolling mill about 22 cwt. After the ingots have been cast they are allowed to cool in order to solidify and are then stripped from their moulds. A sample of molten steel is taken as it is being poured and if the chemical analysis proves satisfactory then the ingot passes on its way. A variation is allowed in the percentage present of the various elements, greater accuracy naturally being demanded for the high grade steels. For example a nickel chrome steel for a gun tube would have limits as Carbon .36 to .37 per cent.; Silicon .12 to .15 per cent.; Manganese .60 to .70 per cent.; Nickel 3.5 per cent.; Chrome .25 per cent.; and would be rejected as unsuitable if found outside these limits, whereas a

commercial steel would pass if say the carbon were .40 per cent.

It is seldom that an ingot is passed on to another department without being cooled to an almost atmospheric temperature. Occasionally the forge department will order an ingot to be sent round in a warm condition, say 500 degs. C. but the ingot stage can be taken as a definite break in the sequence of operations. The ingot can lie, and sometimes does, in the melting house stock yard for years without serious depreciation, but from the point of view of business efficiency it does not pay to allow stock to accumulate, become coated with rust, and involve clerical expenditure in keeping check of it. But the point to bear in mind is that the ingot is the finished product of one department (if need be, of a works) and is capable of being stored or of being transported round the globe. Sales of ingots are a regular feature of the steel trade; transfers of them between works a frequent occurrence, and it can be fairly claimed that the ingot represents the second stage of steel manufacture from the technical point of view.

NOTE.—Steel melting by electricity is undertaken on much the same lines as above, the average cast being, however, about 5 tons, as against 50 in the open hearth furnace. Electric steel from an arc furnace, owing to cleaner methods and the close control of a small quantity of steel, is the best steel obtainable, but is not used for big guns or armour-plate work, as the ingots made are too small. Electric furnaces are used for the production of steel for aeroplane parts and various ordnance fittings, shells, bullet proof plates, etc., which have a much smaller bulk. They are used, therefore, for making special steels which are handled in small quantities only, or employed in works whose capacity is too small to absorb the output of a Siemens open hearth furnace.

3. The working of steel covers those operations during which steel passes from the ingot state into a rough resemblance to the finished product, or to a part of the finished product. These operations include forging—by hammer or press—rolling, pressing, stamping, and extruding. The operations of forging and rolling are the primary operations, and with few exceptions all ingots must go through them first. The exceptions are chiefly concerned with ingots for tyres and for hollow forgings, such as guns or boiler drums. A tyre ingot is "sliced" or cut into five or six pieces before going to the hammer; a gun ingot may be trepanned (bored through the centre) before proceeding to the press. Or it may be that the customer wishes for certain parts of the ingot to be cut off to ensure soundness—the Admiralty requires as much as 40 per cent, or even more to be discarded—and this is done before forging or rolling if the order requires it to be so. Rolling and forging require great power: an average size of rolling mill will have a motor drive of well over 1,000 h.p., whilst a press may exert a pressure of anything up to 10,000 tons. Forging by hammer is a much lighter process, for the press has ousted the hammer in all the bigger operations and it is seldom that hammers of more than 7 or 8 tons are used in heavy steel firms.

As the processes vary so much with the different products, it is not intended to give a comprehensive survey here, but actual operations on certain armament products will be given later. At the moment a general indication of the processes through which a stamping passes is given:—

- Ingot goes to rolling mill;
- Heated up to about 1,150 degs. C;
- Passed and repressed through rolling mill until it is reduced in thickness from some 11 inches square to 3 inches square and is cut off by press or circular saw to required length;
- Cooled and examined;
- Sent to stamping department;
- Reheated and stamped;
- Perhaps another stamping operation;
- Heat treated, giving hardness, temper or condition required;
- "Fettled" or cleaned up;
- Straightened and examined;
- Despatched.

4. This despatch clears out the product from the steel working departments to the machine shops, either belonging to the steel firm or more usually to its customers. Hundreds of thousands of stampings and pressings are despatched from Sheffield for machining in the automobile factories. E.S.C. sends forgings to all the Vickers' works for finish machining, or forgings to Woolwich Arsenal, stainless steel sheets to Firth-Vickers Stainless Steel Co. (previously to outside firms for polishing), steel strips to its own file works across Sheffield, or rolled bars to its tool works at Openshaw in Manchester. Firth-Brown sends gun forgings to the Admiralty, or shell steel rolled in bars; Jessop supplies steel products to its parent company, B.S.A. Ltd., or to its file making concern J. J. Saville & Co.; Hadfield sends its shells from one works to another for machining; whilst Industrial Steels (E.S.C. subsidiary) sells almost all its steel in a bar or billet condition. Thus it is shown that there is yet another water-tight division in the production of steel, this time between worked steel and machining. It is hoped to bring out the importance of these independent operations subsequently.

Production of Armaments.

It has already been demonstrated that the manufacture of steel products can be divided into stages such that a factory could undertake one operation only. It is now intended to show that in addition to a vertical division of manufacturing there is a horizontal one between commercial and armament steels.

So far as pig iron production is concerned the same blast furnaces provide raw materials for both armament and high grade engineering steels, but pig iron for the former is subjected to very careful scrutiny and only the very best qualities are used. A fair importation of Swedish pig iron is made for armaments on account of its purity, a very small percentage of sulphur and phosphorus—weakening elements in steel—being an essential. The other raw materials are closely examined also, as well as the coal used for gas production to eliminate the possibility of an increase in the proportion of sulphur or the introduction of some undesirable element.

The use of alloy steels which, prior to 1910, was confined mostly to guns, armour plating and projectiles, has spread rapidly of recent years into all metal working industries among which the motor industry leads. Prior to that date the majority of high grade engineering firms were very pleased to be able to buy pieces of scrap steel cut off from ordnance work, but demand became so great for the nickel alloy steels that steel manufacturers set out to cater for it. There are infinite possibilities in alloying, but the analyses are to a certain extent checked in number in order to prevent multiplicity of stocks and—an immense bugbear in all steel firms—the mixing of scrap. The most important steels are those containing nickel and chrome, used for crankshafts, gears, valves, axles, ordnances, etc., etc. A popular nickel steel contains about 3½ per cent. nickel and .10 to .50 per cent. carbon and is used in many motor products.

Nickel is the principal alloy added to steel and increases its mechanical properties. Together with chromium it gives the steel great hardness and toughness without a corresponding increase in brittleness. Corrosion resistance is also increased and as both elements depress the temperature at which hardening of steel takes place a wider range of treatment is possible than with carbon steel. For example a steel can be quenched in oil as against plunging into cold water. The results may be the same but there is much less danger of cracking.

Nearly all guns are of nickel chrome molybdenum steel. Molybdenum increases the toughness of steel and also increases the depth of hardness. Another important alloying element is manganese which makes the steel non-warping, non-shrinking, oil hardening at low temperature, and little liable to crack in hardening. An average composition for

armour plate is Carbon .35 to .50 per cent., Nickel 3.5 to 4.0 per cent., Chrome 1.5 to 2.5 per cent., Manganese .4 per cent., Silicon .15 per cent.

As nickel itself costs some £200 per ton it will be appreciated that there is a distinct cleavage between the prices of straight commercial steels and of armament steels. A furnace charged with nickel scrap and pigiron, intended for the production of arms, is directed to that end, and it is seldom diverted to another purpose. The quantity of steel poured from a furnace, in order to err on the safe side, is generally a little bigger than the amount required to fulfil the works order, so the extra ton or so is poured into small ingot moulds. From there it may pass to other armament consumption, or be used in an appropriate commercial transaction (giving very good value for money) or it may be sent back to the furnace for remelting in the next nickel chrome cast. The point is that, although melted in the same furnace as commercial steels, armament steels are earmarked from the start and only a small proportion is sidetracked. But it should be borne in mind that an increasing number of commercial purposes are being found for those alloy steels formerly used for armaments only. In other words "What makes good arms makes better ploughshares."

It is after the ingot stage that arms steel commences to assume its more formidable aspect, and whereas it was distinguished in the furnace by a greater amount of care being spent upon it, it now passes through certain operations which definitely separate it from the commercial steels.

The ingots required for heavy armaments may need a heat treatment process or certain machining operations but they invariably pass to the forge department where in a hydraulic press of great strength they are altered in shape. A brief description is given of the operations certain products pass through.

Armour plate.

Notes.

- | | |
|---|---|
| 1. Ingot ... | — |
| 2. Slab in press ... | A reduction in section. |
| 3. Heat and roll to finished thickness. | Plus allowance for machining and fire waste. |
| 4. Anneal ... | Steel has certain properties derived from its physical condition. The arrangement of the iron, carbon and other molecules determines its hardness, softness, temper, etc., and heat treatment at different temperatures gives the desired effect. |
| 5. Cool and straighten. | Straighten in hydraulic press. |
| 6. Carburize ... | The plates are placed in a furnace in pairs, separated by a layer of charcoal. This charcoal (carbon) enters the steel and gives it a very hard surface. Takes two to three weeks. |
| 7. Treatment ... | Plunging in oil or water after heating to give tensile strength. |
| 8. Drill holes and machine. | Done in planing shops. |
| 9. Differential heat treatment for hardening. | Face at high temperature, back comparatively low. |
| 10. Cool rapidly by water. | Water at high pressure is sprinkled simultaneously on face and back. |
| 11. Mark out and have trial assembly. | — |

No. 6 operation is known as cementation. Non-cemented armour is used for deck plates, the principal feature being great strength and the capability of suffering considerable deformation without rupture.

Guns.

Big naval and military guns consist of an "inner A tube" (replaceable), an "A tube", a "B tube", a jacket, a breach block, and sundry fittings. They are built up in this tubular fashion to ensure greater strength, a certain soundness, and a greater elasticity to shock. British specifications always require acid open hearth steel. An ingot may be 100 tons to commence with and perhaps 10 per cent. is discarded from the bottom and 30 per cent. from the top of it.

1. Ingot.
2. Cut off discard.
3. Trepan—hole bored through centre.
4. Forge on water cooled mandril—mandril is a bar passed through hole in centre to prevent closing.
5. Straighten.
6. Rough machine.
7. Normalize—a heat treatment.
8. Oil harden—a heat treatment.
9. Temper—a heat treatment.
10. Finish outside.

These operations are common to the 3 tubes and jacket. Thereafter:—

11. Keep inner A tube cool in pit by water, heat A tube by gas to expand it, lower on inner A and cool by water to contract it.
12. Fit B tube, then jacket as per operation 11.
13. Breech ring is screwed and shrunk on.
14. Finish machine. Bore and chamber are bored and lapped to size.
15. Rifle. To give a twisting action to the projectile.

Shells.

(Not heavy armament product, and misses the forging operation.)

1. Ingot.
2. Roll in 28 inches blooming mill to 8 to 9 inches diameter.
3. Cut to required length.
4. Machine.
5. Heat treated.
6. Despatch for filling.

Hadfield's armour piercing shells are forged in a horizontal press, then are bored, turned, finished, fitted with a soft nose, and despatched.

A list is next given of the various departments in English Steel Corporation connected with armament manufacture. With reference to armour plate, it may be noted that after the second operation given in the foregoing list, practically all the work is performed in armament departments, the exceptions being operations 6 and 9 which are done in the carbonizing department—about 50 per cent. armament.

Guns are seldom finished at E.S.C. now, the usual procedure being to send the parts after operation No. 9 to the Vickers-Armstrongs works at Elswick, where there are two gunshops, and the armament work is kept apart from the commercial. Whilst it is true that the lathes, boring machines, etc., can be used for commercial work, the two do not economically mix. When the gun work departed from the heavy machine shop at E.S.C., the lathes were used for the machining of boiler drums, catalysers, cranks and rollers, but it was found that they were far too slow to be a commercial proposition. A commercial production does not need anything like the finish of an arms product, and to compete on favourable terms with other manufacturers E.S.C. had to buy many new lathes that fairly ripped off the steel, whilst leaving a finish good enough for commerce, but hopeless from an ordnance point of view. Many of the older machines were despatched to Elswick and Vickers-Armstrongs still holds the option to purchase the original heavy machines remaining in the South Gun Shop at Sheffield.

ENGLISH STEEL CORPORATION, LTD.

Departments exclusively engaged in the manufacture of armaments or overwhelmingly so.

*River Don Works, Sheffield.**Process.*

Armour plate mill ...	Rolling armour plate.
8,000 tons press... ..	Cutting armour plate.
Treatment furnaces at 8,000 tons press. ...	Heat treating armour plate.
40 inch D.C. press ...	Straightening armour plate.
North and south planing shops.	Machining armour plate.
Machines for armour plate tests.	Testing armour plate.
3,000 tons press... ..	Straightening armour plate.
Vertical bending rolls ...	Bending bullet proof plates.
Sealing plant	Removing fire scale from armour plate.
Gun building plant ...	Heat treating guns and shrinking on tubes.
Gun building plant, annealing and tempering.	Heat treating guns.
2,500 tons press... ..	Straightening guns.
Machine shop (test cutting).	Cutting test pieces from gun forgings.
Oil hardening plant ...	Treating bullet proof plates.
Bullet proof machine shop.	Machining bullet proof plates.
Firing range in works and at Totley.	Testing bullet proof plates under fire of rifle and machine gun.

Grimesthorpe Works, Sheffield.

Armour plate mill ...	Rolling armour plate.
-----------------------	-----------------------

Cyclops Works, Sheffield

Three hydraulic presses	Straightening and cutting armour plate.
Treatment furnaces ...	Heat treating armour plate.
Planing shops	Machining armour plate.
Oxy-acetylene cutting department.	Cutting out shapes in armour plate.
Bullet proof treatment furnaces.	Heat treating bullet proof plates.

Note.—Cyclops Works was used by Cammell Laird for the production of armour plate, being the site of all operations thereon after the ingot was rolled in the Plate Mill at Grimesthorpe—about $\frac{1}{4}$ mile away. It is exclusively laid out for the production of armaments and was closed on the formation of the E.S.C. in 1923, manufacture being concentrated at the River Don Works. In the spring of last year—it was opened out for cleaning, overhauling, and preparing for manufacture on the granting of a sum of £5,000 from the Government to E.S.C. It is now maintained in working condition by a Government grant of £1,000 per annum.

Departments considerably engaged in the manufacture of armaments.

*River Don Works.**Process.*

Oxy-acetylene department.	Shaping armour plates.
Carburizing department	Heat treating armour plates and sundry forgings.
Sheet rolling mill ...	Rolling bullet proof plates.

Grimesthorpe Works.

Heat treatment department.	Treatment of armour plates and gun forgings (almost dormant since 1929).

Departments partly engaged.

<i>River Don Works.</i>		<i>Process.</i>
Melting departments ...		Production of open hearth and electric steel, about 20 per cent. for armaments.
Forge		Slabbing of ingots for armour plate mill, and forging guns.
Machine shops ...		Machining guns, aero cranks, armour plate fittings, ship's shafting, etc.
Stamping departments...		Stamping out aero cranks, crank cases, connecting rods, etc., etc.
Rolling mills		Reducing ingots to smaller sections for further work.

Grimesthorpe Works.

Melting departments ...	{	Not much production in these departments now as policy of concentration in River Don Works has been pursued.
Forge		
Foundry		

Service Departments.

All the above departments require services such as hydraulic and pneumatic power, gas, water, electricity and steam. In the case of the departments exclusively armament they are almost self-contained except for electricity (Cyclops is a self-contained works even to a transforming station), therefore no appreciable increase in the cost of services would be made on a withdrawal of armament work. With the other departments the manufacture of armaments is only a small proportion of the total output so there again no considerable increase in the overhead costs would take place.

CHAPTER 2.

THE HEAVY ARMAMENTS INDUSTRY.

Armour plate and steel for heavy ordnance is manufactured by three firms only. These are the English Steel Corporation, William Beardmore & Co. and Thomas Firth & John Brown. The English Steel Corporation is owned by Cammell Laird and by Vickers-Armstrongs. Vickers-Armstrongs in its turn is owned by Vickers and Armstrong Whitworth Securities. Vickers has, however, the largest holdings in Vickers-Armstrongs and therefore controls it. The holdings of Vickers-Armstrongs in the English Steel Corporation are much larger than those of Cammell Laird and therefore Vickers-Armstrongs controls the English Steel Corporation. Thus, despite the participation of other firms, Vickers in fact controls the English Steel Corporation, which is the largest producer of armour plate and steel for heavy ordnance. William Beardmore & Co. is controlled by the Trustees for the Debenture Holders and the Preference Shareholders. Vickers has a very large holding of Second Preference shares. One of the Vickers directors is one of the three members of the Debenture Holders' Committee which controls the company. Therefore, it is correct to say that Beardmore is closely linked with Vickers, even if it is not actually controlled by them.

Thomas Firth and John Brown is a subsidiary of John Brown & Co., and is connected with the English Steel Corporation by the amalgamation of the Firth Brown and the English Steel Corporation stainless steel interests. The English Steel Corporation and Firth Brown divide equally between them the capital of the Firth Vickers Stainless Steel Co.

Shells and armoured turrets are manufactured mainly by Hadfield. Vickers and Firth Brown do make a certain number of shells but by far the most important shell firm is Hadfield.

All these heavy steel firms are closely bound together. They combine to obtain raw material. First a special type of iron ore free from sulphur and phosphorus is essential. A plentiful supply of hematite iron ore, the most suitable type of ore

for armament and high grade steel work, is in great demand. Therefore the armament firms combine to form companies which can supply them with this essential raw material. The Carnforth Haematite Iron Co. (now wound up) was a good example of this. It was controlled by the Darlington Forge which was at that time controlled by the Broadway Finance and Investment Trust and the Glyn Nominees (the one, a subsidiary of, and the other a nominee of, Vickers) and by John Brown. It is interesting to note that the British and Allied Investment Corporation, in which the Czechoslovakian armament firm of Skoda has large investments, was also a large shareholder in the Carnforth Haematite Iron Co.

The supplies of haematite iron in England are becoming exhausted and therefore the armament firms draw their supplies from abroad, particularly from Sweden and from Spain. No doubt there are in Spain and Sweden similar companies to the Carnforth Haematite Iron Co. but owing to the fact that they are abroad it is very difficult to trace them.

The arms firms also combine in the control and production of other essential raw materials. For example, fire bricks for furnaces. The Oughtibridge Silica and Fire Brick Co. was founded by six firms, five of which were armament concerns. The control is now largely in the hands of the English Steel Corporation who hold out of the 177,800 shares some 19,500 in the name of Vickers and another 19,500 in the name of Cammell Laird. The interests of the English Steel Corporation, through Vickers, in the Parkgate Iron and Steel Co., give them another 19,500 shares. Among the other shareholders are Hadfield with 19,500 and John Brown with 16,700 and Thomas Firth and John Brown (controlled by John Brown) with 22,300.

In the same way as the English Steel Corporation and the other armament firms control jointly their supplies of haematite iron and firebricks, so they control the ingredients for electrical furnaces used for melting small ingots. The Electrode Company of Sheffield (now in course of reorganisation) was controlled by Thomas Firth and John Brown and the English Steel Corporation who held between them some 46,000 of the 70,000 shares of the company. Hadfield comes in with another 9,000 shares.

But even more important from the armament makers' point of view is the control of the non-ferrous metals essential for hardening steel. Of these the most important is nickel. Other essential non-ferrous metals include molybdenum, chrome and manganese. The principal firms which supply these essential ingredients are High Speed Steel Alloys and the High Speed Steel Alloys Mining Co. Figure 3 shows the connections of High Speed Steel Alloys with the main armament firms. The largest shareholders are the various firms in the Vickers group but John Brown and Thos. Firth & John Brown participate heavily as do Hadfield and the other armament firms. It should be noted that Vickers has also large interests in the French Nickel Group, the S.A. le Nickel, but again since this is a foreign company it is impossible to discover whether the other armament firms participate and to what extent.

To sum up, it will be seen that the firms which produce armament steel, and particularly Hadfield, the English Steel Corporation and Firth Brown, all of which are now larger and more important than Beardmore, the other firm in the group, are very closely linked together through common supplies of raw materials. Secondly that the English Steel Corporation, Beardmore and Firth Brown are connected, either through the one holding debentures or shares in the other or else by sharing together the control of important subsidiary companies. It is quite evident by studying the financial link-ups between the heavy armament steel firms that there exists in fact an armament steel ring.

Heavy Ordnance.

The same firms which control the armament steel business have the monopoly of the private manufacture of heavy ordnance. All heavy guns are

made by William Beardmore, Vickers-Armstrongs or John Brown & Co. As has been shown Vickers-Armstrongs and William Beardmore are closely connected and the association between John Brown and Vickers is very close.

Small Arms.

Small arms are manufactured by Vickers and by the Birmingham Small Arms Co. In this connection, however, it is worth while noting the position of the Hotchkiss Co., a French concern manufacturing motors and small arms, which has a London office and does a certain amount of business over here. Vickers has already been dealt with. The Birmingham Small Arms Co. is not, as its name suggests, exclusively an armaments concern. It has important outside interests. Through the B.S.A. control of J. J. Saville & Co. and William Jessop & Sons, B.S.A. participates in High Speed Steel Alloys and is thus connected with Vickers and the other armament firms in the armour plate group. B.S.A. also controls the Daimler Co., Ltd., and the Lancaster Motor Co., Ltd., and through B.S.A. Cycles Ltd. it enters the bicycle industry. Other industries of B.S.A. include the manufacture of tools and of machinery for grinding.

Also belonging to the small arms group is the Projectile & Engineering Company which makes smaller shells. This Company is closely associated through the Firth family, who are the largest shareholders in the Projectile & Engineering Company, with Thos. Firth & John Brown. Until 1930 the Projectile & Engineering Co. was almost solely an armament concern, but since that date it has made motor car frames and crank cases.

There are many firms which manufacture sporting rifles and revolvers. It is worth noticing in this connection The London Armory Company, the majority of whose shares are held by the managing director, a former German, now an American citizen. The body which acts politically for this class of small arms makers, is the Gunmakers' Association.

Tanks.

Vickers-Armstrongs is believed to be the only important firm which manufactures tanks.

Warships.

The construction of warships is not restricted anything like so closely as is the construction of armour plate and ordnance. Firms contracting for the Admiralty may be divided roughly into three classes, those which build both engines and hulls of any size; those which specialise in engine construction and those which confine themselves to lighter and smaller craft. In the first class the most important firms are:

Vickers-Armstrongs.
John Brown & Co.
Scott's Shipbuilding & Engineering Co.
Swan Hunter & Wigham Richardson.
The Fairfield Shipbuilding Co.
Cammell Laird.

There are other firms which on occasion build heavy warships. Holland & Wolff, for example, is at present building the cruiser "Penelope." R. & W. Hawthorn Leslie occasionally builds large ships for the Admiralty. But the firms given above can be taken to be the principal builders of warships of all kinds.

Vickers and Cammell Laird are closely associated; as has already been noticed the armament and high speed steel interests of Vickers and of Cammell Laird are combined in the English Steel Corporation. Their other steel and iron interests are combined in the Metropolitan Cammell Carriage & Wagon Co., Ltd., which is controlled by Vickers-Armstrongs and Cammell Laird.

All these firms are members of the Shipbuilders Security Co., a company formed to reduce the number of shipyards. Vickers-Armstrongs, the Fairfield Shipbuilding Co. and John Brown & Co., also control jointly the Michell Bearings Co., which was formed originally to exploit patents which were used exclusively for warships but these patents are now

used very widely in ordinary vessels. Except for these two companies there is no financial link between the Vickers-Armstrongs, Cammell Laird, John Brown group which is bound together by its interlocking steel, iron and raw material interests and the other shipbuilding armament firms.

Scott's Shipbuilding & Engineering Co. is, next to Vickers, perhaps the most important of the naval armaments firms. At the present moment the entire construction in the Scott shipyards consists of Admiralty orders. Scott is at present constructing two cruisers, one submarine and two destroyers. Scott's Shipbuilding & Engineering Co. formed in 1899 is a private company registered in Scotland. The capital consists of 2,500 preference shares and 27,500 ordinary shares of £10 each. The majority of the shares are held by the Scott family but some 9,000 are held by the Ocean Steamship Co. and the China Mutual Steamship Co.

The Fairfield Shipbuilding Co. is building two destroyers and one depot ship. This company is controlled by the Shipbuilders Investment Co. An examination of the shareholdings of the Shipbuilders Investment Co. shows that the controlling blocks of shares are in the hands of various individuals described in the returns as Esquires. On investigation these gentlemen appear to be clerks and officials in the employ of Kleinwort, the well-known private banking company which has important German and continental connections.

Swan Hunter & Wigham Richardson is at present building a cruiser for the Australian Navy and two destroyers for the Admiralty. Swan Hunter & Wigham Richardson, as shown in Figure 4, is connected through the Glasgow Iron & Steel Co. with Beardmore. Like Vickers it has branched out into other aspects of the armament industry. Recently Swan Hunter formed, in collaboration with Fokker, a new aircraft firm, Air Speed Ltd. Swan Hunter also controls the Wallsend Shipway & Engineering Co. which is one of the three engineering firms which build marine engines for the Admiralty.

This leaves still to be considered Vickers-Armstrongs, John Brown & Co. and Cammell Laird. Vickers-Armstrongs is at present building at the Barrow yards four destroyers and two submarines for the Admiralty and two submarines for the Esthonian Government. At the Newcastle dockyards it is constructing the hulls of two destroyers and of two 9,000 ton cruisers for the Admiralty. Cammell Laird is building at Birkenhead the new aircraft carrier "Royal Oak," a flotilla leader and one submarine all for the Admiralty. John Brown & Co. is building at Clydebank one 9,000 ton cruiser and one destroyer.

All these firms, however, are not only naval armament shipbuilding firms but also ordnance makers, armour plate manufacturers and general armament merchants. For this reason it is better to leave consideration of them until later.

Marine Engineering.

There are three firms which, though they do not build any warships, do benefit largely from the construction of engines for them. These firms are William Beardmore & Co., Parsons Marine Steam Turbine Co., and the Wallsend Shipway and Engineering Co.

As previously noticed the Wallsend Shipway is owned by Swan Hunter. Last year it only obtained some £120,000 worth of naval orders, as compared with £220,000 of orders for machinery obtained by Beardmore. Wallsend Shipway is the least important of the marine engineering firms.

Beardmore, as already noted, is closely connected to Vickers. It would seem that it is also related to Swan Hunter through the Glasgow Coal & Iron Co. A number of the directors of Beardmore are also directors of the Glasgow Coal & Iron Co., one-half of whose capital is held by Swan Hunter. It should be noticed that the Law Debenture Corporation acts as Trustee for the Debenture Holders of both Beardmore and Cammell Laird, thus making another link between the Vickers group and Beardmore.

Parsons Marine Steam Turbine is owned by members of the Parsons family but it is also closely linked with the Vickers group. Sir Eustace Tennyson d'Eyncourt, a director of Parsons, is also a technical adviser to Vickers-Armstrongs. The Spanish Parsons, which exploits Parsons patents in Spain, is controlled jointly by Parsons Marine Steam Turbine, its subsidiary, Parsons Foreign Patents, by Vickers-Armstrongs and by John Brown. It appears that Parsons works in close connection with Vickers.

Belonging to this class of marine engineers is the boiler making firm of Babcock & Wilcox. Babcock and Wilcox makes boilers of every description for every purpose, but it is also an important armament firm in the sense that a proportion of its work consists of building boilers for warships. It is a truly international firm. There is a German Babcock & Wilcox, a French Babcock & Wilcox, a Dutch Babcock & Wilcox, a Spanish Babcock & Wilcox, an Italian Babcock & Wilcox and a Canadian Babcock & Wilcox. In addition, it has a Japanese subsidiary and owns 49 per cent. of the capital of the largest Polish boiler works. Babcock & Wilcox also owns the Vickers Boiler Co. and other boiler works in England. A study of *Jane* shows that a large proportion of the fleets of every nation is equipped with Babcock & Wilcox boilers.

Babcock & Wilcox is linked to the Vickers group in two ways. Until recently Colonel Philip Ionides, deputy chairman of Armstrong Whitworth Securities, sat on the Babcock & Wilcox board and was, in fact, chairman of the Spanish Babcock & Wilcox. Babcock & Wilcox participates in Dorman Long & Associates (China) in which Associated Electric Industries (in which Vickers have large holdings) also participates. Recently the English Electric, which is closely associated with John Brown & Co., has taken a contract together with Dorman Long & Associates (China) and has thus become for practical purposes a member of the Dorman Long China syndicate.

Smaller Naval firms.

Under this head are described those firms which specialise in the construction of destroyers, gun boats and sloops. The most important firms in this class are John I. Thornycroft & Co., of Southampton, Alec. Stephens & Sons, of the Clyde, Yarrow & Co. and J. Samuel White & Co., of Cowes. At present Alec. Stephens & Sons is building two destroyers and two sloops for the Admiralty. The only other work it has on hand is one 1,000-ton cargo vessel, so that at present it is practically maintained by its armament work. This company (registered in Scotland) is controlled by the P. & O. Steamship Co. which holds 76,193 preference shares out of a total of 128,449, and 102,000 ordinary shares out of a total of 200,000.

The method by which the P. & O. has exercised this control is typical of the way in which the control of armament (and other) firms is switched about among nominees. Since 1929 the holding of the P. & O. has been registered successively in the names of the Eastern Traders Ltd., Hong Kong, Edward Hain & Son Ltd., Mackie & Co., Eastern Traders Ltd., and in 1934 back again to Edward Hain & Son Ltd.

Thornycroft is at present building two destroyers and four motor pinnaces for the Admiralty. Its only other shipbuilding consists of a small motor tug. This, however, does not mean that Thornycroft is practically exclusively an armament firm because it has in addition to its shipbuilding works important motor interests and does a good deal of marine engineering as apart from shipbuilding. Its other interests include building trolley buses and motor boats.

Thornycroft has, like Babcock & Wilcox, a number of foreign firms—Thornycroft Australia, Thornycroft India, Thornycroft Brazil, Thornycroft Singapore, Thornycroft Egypt, Thornycroft

Argentina. Thornycroft is one of the firms which participate in Dorman Long & Associates (China). J. Maughling, director and secretary of Thornycroft, is also a director of Dorman Long & Co. (China). Through its investments in Dorman Long & Associates and its interlocking directorate with this firm, Thornycroft is linked with Babcock & Wilcox and indirectly through Associated Electrical Industries, with Vickers.

Yarrow & Co. is at present building a flotilla leader and a net layer for the Admiralty. The only other shipbuilding work which it has at present on hand is a small yacht. Like Thornycroft, however, Yarrow is not exclusively a shipbuilding firm. It manufactures also marine engines and it is well known for its Yarrow boilers. It has two foreign subsidiaries, one in Canada, the other in Yugoslavia. In the latter a great deal of armament construction for the Yugoslav Government is done. Yarrow boilers are also widely used in foreign warships. Also large numbers of foreign warships are built in foreign dockyards to Yarrow designs. Recently the firm has provided boilers for the Japanese, Italian and Dutch navies, and the Dutch Government has built eight destroyers from Yarrow designs and under Yarrow supervision in its own dockyards. In the same way Yarrow has recently fitted out two Portuguese destroyers of which the hulls were built in Portugal. Yarrow & Co. is owned by the Yarrow family. Yarrow is probably the most important of the smaller naval shipbuilding firms.

J. Samuel White of Cowes is the oldest of all the armament firms. At present it is building two mine-sweeping sloops for the Admiralty and two large destroyers for the Polish Government. Its other shipbuilding work consists of two yachts and three lifeboats. Like Yarrow, J. S. White also builds machinery and boilers and it does quite an important business in engineering the smaller warships built in government dockyards. In the past J. S. White has made great efforts to obtain foreign armament orders and is for that reason important. Like Yarrow, warships to its design, are built abroad under licence from it.

Other Naval firms.

There remain to be considered one or two other firms which do constructional work for the Admiralty but whose naval shipbuilding is small in comparison with the ordinary work which they undertake. Harland & Wolff, to which already reference has been made, is typical of this class of firm. Harland & Wolff is registered in Belfast where its principal yards are situated, but it also has yards on the Clyde and at North Woolwich. It controls through David Colville & Co. the steel interests of the great Scottish firm of Colville, and through it controlling interests in large collieries in Lanarkshire and Stirlingshire. The Belfast yard of Harland & Wolff is the largest single yard in the country.

The control of the company was originally associated with the Royal Mail Steam Packet Company and the Elder Dempster Co. Ltd.

Harland & Wolff, therefore, is almost the greatest shipbuilding company in the British Isles. It is, it is true, building one cruiser for the Admiralty, but its armament work is practically negligible compared to its other interests.

William Denny & Bros., of the Clyde also, like Harland & Wolff, is at the moment mainly engaged in civil trade, but it is building two destroyers and a survey ship for the Admiralty. This company, registered in Scotland, capital £500,000, is controlled by the Denny family.

William Hamilton & Co., of the Clyde, does a little armament work. It is at present building one sloop for the Admiralty. This is a private company registered in Scotland with a capital of £170,000. It is controlled by the Cunard Company.

R. & W. Hawthorn Leslie & Co., Hepburn-on-Tyne, a very old shipbuilding firm, originally established in 1817, has done a certain amount of naval construction but at present it is not building

any ships for the Admiralty. This company has also important interests in building locomotives, patent locomotive trains, petrol and electric locomotives and rail motor coaches. The issued capital consists of £358,000.

William Doxford & Sons, Sunderland, has also done in the past a certain amount of naval shipbuilding. This company is now controlled by the Shipbuilders Investment Company, which also controls the Fairfield Shipbuilding Co., and is itself controlled, through nominees, by the British and foreign banking house of Kleinwort.

Palmers Shipbuilding & Iron Co. was at one time an important naval shipbuilding firm. Recently it has not done any construction for the Admiralty, and early this year the entire ordinary capital was acquired by Vickers-Armstrong's.

J. Stone & Sons should perhaps be mentioned as one of the principal suppliers of propellers for naval ships and the Yorkshire Tube Co. should be noted as sometimes supplying boilers.

Vickers-Armstrong's, Beardmore, Cammell Laird, John Brown Group.

Though the interconnection of the steel interests of this group has been dealt with in some detail, close examination of these firms has been postponed until the conclusion of this survey of the armament firms.

It will be seen that this group includes all the makers of armament steel with the exception of Hadfield and Hadfield only makes shells, bombs and castings for gun turrets, etc. Hadfield is, moreover, closely connected through its steel interests with the Vickers-John Brown group. This group also includes most of the important naval shipbuilding firms. It includes all the makers of heavy ordnance and of torpedoes and warlike accessories for ships of war. It is important to note also that this group extends into the aircraft industry, Vickers having subsidiary companies of Vickers Aviation and the Supermarine Aviation, Armstrong Whitworth sharing in the control of the Armstrong Siddeley Development Co. which controls Armstrong Siddeley Motors, Sir W. G. Armstrong Whitworth Aircraft, A. V. Roe and Air Service Trading.

With the exception of two of the aircraft firms, Babcock & Wilcox, Yarrow, and Thornycroft, this group of armament firms are the only British armament firms to have important foreign armament interests.

Vickers and Armstrong Whitworth Securities are very closely linked together. Armstrong Whitworth Securities has certain civil interests represented by Craven Bros. Armstrong Construction, etc., but one of its main interests is its investment in Vickers-Armstrong's, the main armament manufacturing company in England. The undertakings of Vickers-Armstrong's can again be subdivided into civil and military interests. Through the Securities Management Trust, Vickers-Armstrong's together with Armstrong Whitworth Securities control the Lancashire Steel Corporation which, in its turn, controls a number of iron and coal companies. These undertakings can all be regarded as purely civil. Vickers-Armstrong's also, in its shipyard and engineering shops undertakes a certain amount of civil shipbuilding and engineering. At present Vickers-Armstrong's is building at Barrow two passenger steamers of 24,000 tons gross and a turbine steamer of 15,000 tons gross. The main interests however of the Vickers-Armstrong's group are in armaments. It controls the Thames Ammunition Works, which is said by the Vickers directors to be mainly engaged on the manufacture of civil explosives, but which does no doubt produce armaments, and the Whitehead Torpedo Co.

Abroad Vickers-Armstrong's owns Vickers (Ireland) whose interests are mainly civil, and the Placencia de las Armas in Spain which is an armament firm pure and simple, manufacturing ordnance and small arms. It is interesting to note that Sir Basil Zaharoff is a director of this firm.

Vickers-Armstrong's has also innumerable investments in civil and arms firms abroad. The most important of these are its investments in Resitza,

the Roumanian armaments works; its participation in the Japanese steel works, part of the great Mitsui concern the chief armament factory of Japan; its interest in the Italian armament works Vickers-Terni (believed to be about 25 per cent.) and its interests in the Spanish Sociedad de Construcción Navale. This latter company is the greatest naval shipbuilding enterprise in Spain. As was shown at the American Arms Inquiry it is closely linked by agreements and trading arrangements with the Electric Boat Company whose European licensees are Vickers-Armstrong's. Commander Sir Charles Craven sits on the board of the Sociedad as deputy chairman.

The English Steel Corporation, which manufactures Vickers' armament steel is controlled by Vickers but Cammell Laird participates in the share capital of this concern. Though an armament firm, Cammell Laird has now no steel works of its own, all of its former armour plate and armament works having been transferred to the English Steel Corporation. The link between Vickers-Armstrong's and Cammell Laird is made stronger by the amalgamation of their iron and coal and railway wagon and rail businesses in the Metropolitan Cammell Carriage and Wagon Co. (recently reorganised) which is controlled by Vickers-Armstrong's with participation in the management by Cammell Laird.

Thus Armstrong Whitworth Securities, Vickers Ltd. and Cammell Laird are all very closely bound together. However, it should be noted that Vickers-Armstrong's and Cammell Laird, though amalgamated for the purpose of producing armour plate, and armament steels, are in theory independent and competing naval shipbuilders and that Vickers and Armstrong Whitworth Securities, though they are amalgamated for the greater part of their armament activity, are nevertheless, competitors in so far as the aircraft industry is concerned.

Vickers as distinct from Vickers-Armstrong's, controls a number of companies. Among these should be noted Vickers Aviation which in its turn controls the Supermarine Aviation, Cooke Troughton & Sims which manufactures, among other things, sights and optical appliances used in warfare, and a number of finance companies whose objects it is difficult to ascertain. Among these should be noticed the Broadway Finance and Investment Co. which is sometimes found holding shares and lending money to firms in the Vickers-Armstrong's group.

Vickers has also invested heavily in William Beardmore & Co. It holds 108,000 second preference shares and appears to be among the largest of the debenture holders in that firm. As Beardmore is controlled by the debenture holders and by the preference shareholders, this puts Vickers in a very strong position with regard to the control of a nominally competing armaments firm.

Thus, though Armstrong Whitworth Securities, Vickers, Cammell Laird and Beardmore appear to be competing in certain branches of the armaments industry, they are in fact so closely linked together that it is impossible to describe them as independent firms.

John Brown & Co. stands slightly outside this group and its connection with Vickers is not so close as that of Armstrong Whitworth Securities or Cammell Laird.

It has already been noted that the steel interests of Firth Brown, a subsidiary of John Brown & Co., are closely linked up with the English Steel Corporation (uniting the steel interests of Cammell Laird, Armstrong Whitworth Securities and Vickers). Firth Brown is linked to the English Steel Corporation through Firth Vickers Stainless Steels, the Electrode Company of Sheffield, the Oughtibridge Silica and Firebrick Company, and was closely associated with the E.S.C. in the Carnforth Haematite Iron Company. Further links are provided by the Michell Bearing Co. and the Shipbuilders Securities. More interesting, however, and showing clearly the ramifications of the finance of the big armament groups is the connection between the electrical interests of John Brown and of the Vickers Group.

In 1919 John Brown, Cammell Laird and the Fairfield Shipbuilding Company formed together the

English Electric which took over, among other things, the old Coventry Ordnance Works, up till then controlled jointly by the Fairfield Shipbuilding Company and Cammell Laird. Until 1930 the English Electric was controlled by John Brown & Co. and Cammell Laird continued as a very large shareholder. In 1930, after the reorganisation, John Brown was left with only 20,765 ordinary shares out of a total ordinary share capital of 1,443,500. But it seems likely that some of the directors and other corporations, who appear with large shareholdings are nominees of John Brown & Co. and of Cammell Laird. The main control of the company, however, rests with nominees of American concerns, for example, the Chase nominees hold 125,000 ordinary shares and an American director Brig. General W. H. Hayes holds (presumably as a nominee) 300,000 ordinary shares.

Vickers has also electrical interests which are represented by Associated Electrical Industries which include as subsidiaries Metropolitan Vickers and Metropolitan Vickers Export (the Company concerned in the Russian Spy trial). Out of 4,896,000 ordinary shares, Electric Holdings Ltd., a Vickers subsidiary, holds 493,643. Vickers Train Lighting Ltd., another Vickers subsidiary, holds a further 50,000 and General Sir Herbert Lawrence, the Vickers nominee on the Board of Associated Electrical Industries, another 40,000. As with English Electric the main control of the company is held by American interests, chief of whom are the International General Electric Corporation of New York which, together with its associates subsidiaries and nominees holds just over 1,200,000 shares. It is quite conceivable that, if it were possible to investigate these American interests, it would be found that the same financial groups which ultimately control the International General Electric Corporation also control the interests behind the nominees controlling English Electric.

At any rate, English Electric and Associated Electrical Industries are connected through interlocking directorates. Mr. C. F. Spencer sits on the board of both companies. The Anglo-American banking firm of Higginson & Co. is closely associated with English Electric. One of the partners in this concern is Sir Guy Granet, director of Associated Electrical Industries. Finally, as has been noticed, Associated Electrical Industries and English Electric are connected through Dorman Long and Associates (China), though it should be noted that English Electric is not a shareholder in this concern.

These inter-connections through the Electrical Industries of the various concerns, have been gone into at some length because they do show the complexity of the financial connections of the English heavy armament industry.

There is yet another way in which firms in this group are connected. It sometimes happens that subsidiary companies belonging to the different groups are connected because some outside investment company or bank lends them money or participates in their capital. For instance, up till 1933, the British and Allied Investment Corporation had lent money to the Darlington Forge (at that time controlled by Vickers-Armstrongs through the Glyn nominees and the Broadway Finance & Investment Company). The British Allied Investment Corporation had also lent money to Craven Bros. controlled by Armstrong Whitworth Securities. Mr. H. E. Carter, a director of the British & Allied Investment Corporation therefore sat on the boards both of the Darlington Forge and of Craven Bros.

The Czechoslovakian armament works of Skoda has large investments in the British & Allied Investment Corporation and the British & Allied Investment Corporation is the Trustee in England for the Skoda Debenture holders. The British & Allied Investments together with Skoda control the British Sugar Manufacturers. Skoda has the right to nominate the chairman of this company and the gentleman it has nominated is Mr. H. E. Carter, director of Craven Bros. and until last year director of the Darlington Forge. Thus we have the situation that, not only is Craven Bros. connected to the

Darlington Forge via Armstrong Whitworth Securities, Vickers-Armstrongs and the English Steel Corporation, it is directly connected via the British and Allied Investment Corporation which in its turn is connected to Skoda. Skoda is itself controlled by Schneider.

No account of the heavy armament industry would be complete if it did not include some account of the international connections of the Vickers-John Brown group.

The American connections of the electrical side of John Brown and Vickers have already been noted.

In dealing with Parsons it has been shown that it has a foreign subsidiary in which John Brown and Vickers participate.

In the same way in dealing with the steel interests of the group it has been shown that Vickers, John Brown and Hadfield often participate in companies which have mines and interests abroad. For example, Vickers-Armstrongs, through the English Steel Corporation has shares in the S.A. le Nickel, the principal French nickel firm. No doubt the other armament firms have also shares in this concern but it is difficult to prove as we have no access to the books of the French firms. In 1901 the S.A. le Nickel joined with Vickers, John Brown & Co., and Beardmore to form the Anglo-French Nickel Co. which, until 1931 carried on a nickel refining business in England.

It has already been noticed that the English armament firms joined in producing their steel alloys in the High Speed Steel Alloys and in the High Speed Steel Alloys Mining Co. But more significant in showing the international ramifications of the armament industry is the position of the Steel Manufacturers Nickel Syndicate. The Steel Manufacturers Nickel Syndicate contains only armament firms and it contains almost all the principal armament firms of Europe with the exception of those of the ex-enemy countries. It was, like the Anglo-French Nickel, founded in 1901. Its office has always been the Vickers office. Its secretary has always been a member of the Vickers staff, and until the Anglo-French Nickel was wound up he has usually been a director or secretary of that company. The shareholders in the Steel Manufacturers Nickel Syndicate when founded were Beardmore, Cammell Laird, John Brown & Co., Schneider, Krupp and Dillinger, or their nominees. Later the Terni, the Italian armaments works, the Wiltowitz Bergbau Eisenhuter C.A., the French naval construction firms of St. Chamont and of Chatillon and the English firm of Hadfields joined the list of shareholders.

In 1917 the names of Krupp, Dillinger and Wiltowitz were removed from the shareholders' list and their shares transferred to the secretary of the company. The present, 1935, list of companies which either hold shares themselves or hold through nominees is as follows:

Beardmore, Firth Brown, Chatillon, the English Steel Corporation (= Vickers, Armstrong Whitworth Securities and Cammell Laird), Hadfield, Marine et de Homecourt, Schneider, Terni, Vickers-Armstrongs, together with the secretary, who holds the shares originally belonging to Krupp, Dillinger and Wiltowitz.

The object of the Steel Manufacturers Nickel Syndicate is to buy nickel for the member companies, that is to say, to see that whoever goes short of nickel it will not be the armament firms.

Thus the Vickers, John Brown group is closely associated with the French and continental armament firms in the control of raw materials essential for armament work.

The Vickers group is also closely connected with the French armaments group through the other interests of the financiers who control the parent companies in the group.

The control of the board of Vickers is closely bound up with the banking house of Glyn Mills, who are Vickers' bankers, and who hold shares as nominees in Vickers-Armstrongs. Two partners of Glyn Mills, Sir Herbert Lawrence and Mr. A. T. Maxwell sit on the board of Vickers. Two partners of

Glyn Mills also sit on the board of the London Committee of the Ottoman Bank. These two partners are Sir Herbert Lawrence and his brother-in-law Lord Hillingdon. Sir Herbert Lawrence also is chairman of the Anglo-International Bank, on the board of which sit three other directors from the London Committee of the Ottoman Bank. The controlling block of shares in the Anglo-International Bank stands in the name of Sir Herbert Lawrence, Sir Otto Niemeyer (incidentally a director of Vickers-Armstrongs) and Sir Peter Bark (a former Czarist Minister of Finance).

Thus, the chairman of Vickers, Sir Herbert Lawrence, is also one of the most important partners in Glyn Mills and is chairman of two very important Anglo-European Banking concerns, the London Committee of the Ottoman Bank and the Anglo-International Bank. Sir Herbert Lawrence is also chairman of the Bank of Roumania, which is an offshoot of the Ottoman Bank.

The Paris Committee of the Ottoman Bank is closely linked to that group of companies and banks which is dominated by Schneider. Mr. Horace Finaly, who is popularly reputed to be the power behind the Comité des Forges, sits on the board of both the Paris Committee and of the Banque de l'Union Parisienne, whose relation to Schneider is roughly similar to that of Glyn Mills to Vickers. M. J. de Neufville sits both on the board of Schneider and on the Paris Committee. Three members of the Paris Committee, M. J. de Neufville, M. F. Mallet, and Baron Hottinguer sit on the board of the Union Européenne, which is a company controlled by Schneider which controls Schneider's heavy steel and armament interests abroad. There is thus a very close connection between the Paris Committee of the Ottoman Bank and Schneider. The Paris Committee and the London Committee are closely associated over a number of joint enterprises, among which may be mentioned, as well as the Bank of Roumania, the British-French Discount Bank. The London Committee is closely associated with Vickers. Sir Herbert Lawrence is chairman of both, Mr. A. J. A. Jameson sits on the board both of the Ottoman Bank and of Vickers, Sir Guy Granet is on the board of Associated Electrical Industries and the Ottoman Bank. The link between Vickers and the Ottoman Bank is strengthened by the fact that besides Sir Herbert Lawrence another director of Vickers' bank, Glyn Mills, is on the board of the London Committee.

The Anglo-International Bank is equally linked to the Ottoman Bank, with whom it shares four directors, and with Vickers, whose chairman is also its chairman. As has been noted, the control of the Anglo-International Bank is in the hands of three persons, one of whom is chairman of Vickers and of Vickers-Armstrongs, another of whom is a director of Vickers-Armstrongs. Among the concerns in which the Anglo-International Bank has large interests is the Anglo-Czechoslovak and Prager Bank. Two directors from the Anglo-International Bank sit on the board of the Anglo-Czechoslovak. Among the other directors of the Anglo-Czechoslovak is Mr. H. E. Carter, whom we have met as a director of Craven Bros. as a former director of the Darlington Forge, as managing director of the British and Allied Investment Corporation, and as a nominee of Skoda as chairman of British Sugar Manufacturers.

Among other directors of the Anglo-International Bank is Major Julian Day, a former United States subject, who is one of the two managing partners of Dawday Day, a private bank. The other managing partner in this concern is General Dawday, chairman of Armstrong Whitworth Securities and deputy chairman of Vickers-Armstrongs.

Thus, the Anglo-International Bank is directly connected to Vickers Ltd. through Sir Herbert Lawrence who is chairman of both companies. It is directly connected to Vickers-Armstrongs through Sir Otto Niemeyer who, though not a director of the Anglo-International Bank is, nevertheless, one of three persons who hold the controlling block of shares. The Anglo-International Bank was directly connected with the English Steel Corporation subsidiary, the Darlington Forge through Mr. H. E.

Carter. It is still directly connected to the Armstrong Whitworth subsidiary Craven Bros. through him. It is indirectly connected to Armstrong Whitworth and to Vickers-Armstrongs through Major Day and Dawday Day.

Finally, as an example of the very close relationships which exist between the Vickers group and the Ottoman Bank and the Anglo-International Bank, it may be stated that between 1929 and 1933 all the shares of the Broadway Investment & Finance Co. stood in the names of two officials of the Anglo-International Bank. Notwithstanding this the directors of the Broadway Finance & Investment Co. were not directors or nominees of the Anglo-International Bank but were the directors of Vickers.

To sum up, Vickers and, to a lesser degree, Armstrong Whitworth Securities and Glyn Mills (Vickers' bank) are very closely connected with the Anglo-International Bank and with the London Committee of the Ottoman Bank. The London Committee of the Ottoman Bank and the Anglo-International Bank are themselves closely connected by four interlocking directorates. The counterpart of the London Committee of the Ottoman Bank, the Paris Committee is very closely connected through interlocking directorates with the group of banks and finance companies associated with Schneider. The Anglo-International Bank is interested in banking houses in Czechoslovakia, Hungary and Poland where the subsidiary firms and interests of the Schneider group is greatest. The Ottoman Bank controls the Bank of Roumania in which country both Vickers and Skoda have important interests.

Secondly, through the British and Allied Investment Corporation, Armstrong Whitworth and Vickers-Armstrongs have been indirectly linked with Skoda which is a subsidiary of Schneider.

Thirdly, through the Steel Manufacturers Nickel Syndicate the S.A. le Nickel and the Anglo-French Nickel, John Brown, Hadfield, Beardmore, Vickers, Cammell Laird and Armstrong Whitworth have all been connected with the French and European armament firms.

Fourthly, Vickers and Armstrong Whitworth Securities, through their control of Vickers-Armstrongs, have investments in many foreign armament firms, of which probably only a few are known. It is certain however that Vickers-Armstrongs has investments in the Sociedad Construcción Navale of Spain, in which it is thought that Krupp has also investments. It has investments in the Japanese steel works in which Schneider has also interests, and there are others including the unexplained firm of Vickers-Schneider about which the chairman said at the last Vickers meeting there was a plan to form such a company but that it fell through.

Summary.

The Heavy armaments industry falls into three main divisions—

- (1) the making of armour plate, armament steel, and ordnance;
- (2) naval shipbuilding;
- (3) small arms.

A fourth division might be given for tanks, but as they are made only by Vickers-Armstrongs, they can be conveniently considered under the first head.

The firms under the first head are:—

The English Steel Corporation (which is composed of Vickers Ltd., Armstrong Whitworth Securities, and Cammell Laird).

John Brown & Co. and its subsidiary Thos. Firth and John Brown.

William Beardmore & Co. (controlled by Vickers).

Hadfield.

Of these the English Steel Corporation and John Brown are by far the most important, for everything except armour piercing shells which are almost exclusively made by Hadfield. All these four firms are bound together by subsidiary companies seeking for raw materials and John Brown and Vickers are further linked by the amalgamation of their stainless steel interests.

In the second class the number of firms is much greater. They can, roughly speaking, be divided into three classes, those which build ships of all sizes, those which confine themselves to marine engines and those which specialise in lighter craft. Among the first class are found in addition to Vickers-Armstrongs, John Brown and Cammell Laird; Scott's Shipbuilding & Engineering Co., which is now for practical purposes exclusively an armament firm, only to-day building ships for the Navy; the Fairfield Shipbuilding Co., controlled indirectly by Kleinwort; and Swan Hunter & Wigham Richardson. Also in this class are Harland & Wolff and R. & W. Hawthorn Leslie, which occasionally build for the Admiralty.

In the marine engineering class are only four important companies: The Wallsend Shipway & Engineering Co., which obtains only comparatively small order and is controlled by Swan Hunter & Wigham Richardson; William Beardmore & Co., which is closely connected with Vickers; Parsons Steam Turbine Co., related to Vickers-Armstrongs; and Babcock & Wilcox boiler makers, which is an international firm with subsidiary companies in every country.

In the third class are John I. Thornycroft & Co., which specialises in destroyers and light craft for the Admiralty, and which at the moment is practically only building ships for the Navy, but which also does large motor bus and tractor business; Yarrow & Co., which is practically only building boats for the Navy at the moment and which has also important marine boiler works; J. Samuel White, whose orders at the moment are practically confined to work for the Admiralty and the Polish Government; and Alec. Stephens & Sons, which does a certain amount of civil work but the majority of whose construction at the moment is for the Admiralty.

In the third class of small arms the most important producers are Vickers-Armstrongs, the Birmingham Small Arms Co., the Projectile & Engineering Co., and the groups represented by the Gunmakers' Association. Through subsidiary firms the Birmingham Small Arms Co. is connected with the High Speed Steel Alloys and thus with Vickers and the other armament firms.

Thus, by far the most important firm in the heavy armament industry is Vickers which has drawn into its orbit Armstrong Whitworth Securities, William Beardmore, Cammell Laird and John Brown. This group, together with Hadfield, controls the output of steel for armament purposes and the members of the group dominate the naval shipbuilding and the small arms trade as well as monopolising the ordnance and armour plate business. Through the Anglo-International Bank and the Ottoman Bank Vickers is closely linked up with Schneider and the French armament group. Through their investments abroad the Vickers group is further connected with foreign armament firms and in order to obtain certain raw materials essential for armament work, Vickers and other members of this group have amalgamated their raw material interests, and have combined to obtain these raw materials with French and Italian armament firms.

CHAPTER 3.

THE CHEMICAL INDUSTRY.

- (1) Introduction.
- (2) The Manufacture of Chemical Warfare Agents.
- (3) Explosives, Ammunition and Intermediates.
- (4) The Existing Organisation of the Chemical Industry.
- (5) The Industry of Defensive Measures against Gas Attacks.
- (6) Bibliography.

(1) INTRODUCTION.

The Chemical Industry and the Supply of War Material.

The Royal Commission on the Private Manufacture of and Trading in Arms is required, under its terms

of reference, to consider the practicability and desirability of the prohibition of the private manufacture of war material, and the institution of a State monopoly of such manufacture and trade, and to examine the present arrangements in force in the United Kingdom relative to the control of the export trade in war material.

The problem in this chapter is to apply these principles to the Chemical Industry in its relation to war material. It is impossible to give a complete analysis of this vast industry within the limits of this memorandum which has been drafted as an introduction, and as an indication of the problems which the Royal Commission is considering.

The Chemical Industry manufactures two main groups of war material, namely explosives and poison gases, and since the emphasis upon the efficacy of these mediums should serve to show the importance of any change which may reduce the risk of war, the efficacy of poison gases may be suitably described at this stage.

It is difficult to calculate the actual effect of a bombardment with poison gases; data are not easy to obtain, and lethal dose rates are based upon animal, not human life. However, those gases which are lethal for animals are also lethal for human beings, the chief differences being the larger dosage required for humans. In addition, there are numerous physical factors such as wind, which will disturb the gas layers, or they will diffuse with varying rapidities. A cloud of gas would be more concentrated at bomb discharge points than on the fringes of such explosion and the gas, being denser than air, may be more concentrated in low lying land.

For the purpose of estimation of the effect of the gas, it may be assumed that a flat surface of one square mile is to be covered with a blanket of gas, twenty feet thick, without the complications of all the incalculable factors. It should be clearly understood that these circumstances are impossible of attainment, and that air movement is bound to reduce the effectiveness of the gas. It is, however, a common practice in scientific work to make basic calculations of this sort in order to compare the relative effects by different gases, etc.

Now a lethal dose required to kill a dog in thirty minutes is, for two well-known war gases, as follows:—

Phosgene—0.3 milligrammes per litre of air.

Lewisite—0.05 milligrammes per litre of air.

From this information it is calculated that 4.7 tons of phosgene or 0.8 tons of lewisite would, under ideal conditions, give a lethal dose over a square mile in a blanket twenty feet deep.

The following calculations illustrate the potential production of poison gas in a war situation. There could be a production of chlorine during war time of over 1,000 tons per week, which chlorine could be used to manufacture either 1,380 tons of phosgene or 1,395 tons of lewisite. This amount of lewisite under the conditions detailed above would cover about 1,750 square miles of ground, being an area 50 miles long and 35 miles wide. Figure 5 gives these relations and some idea of the number of bombing planes of 5,000 lbs. carrying capacity necessary for this experiment. Any reasonable factor for the incalculables or for the difference in lethal dose between man and animal may be assumed. But the deadliness of this warfare will still be apparent.

In considering the lethal effectiveness of gases note should be made of the fact that mustard gas, lewisite and arsenious dusts are persistent, and not easily disturbed, as are chlorine, phosgene and the nitrogenous gases. There is little true protection for the civilian population. Mustard gas and lewisite act upon the skin, and cumbersome complete rubber protection is necessary. Filter gas masks can be made, capable of dealing with most of the gases named, but sneezing gas in certain concentrations will penetrate. In any case, if the concentration is great, there may not be sufficient oxygen present to sustain life and therefore portable or fixed oxygen inhalers are necessary for complete protection. Shelters equipped for the protection of the civilian population, bomb proof and equipped with oxygen

apparatus would cost an enormous sum, probably £50 per head of the population in our cities.

All talk of civilian protection in cities is talk only, unless each human being is possessed of a gas mask, and has an oxygen equipped bomb proof shelter, with artificial ventilation and filters within one hundred yards of his home. Even then, the destruction of the cities by incendiary and high explosive bombs means that all essential services may have ceased to exist. Thus the "safety" of the gas proof shelter is only left for a city destroyed by aerial bombardment.

Such are the nature of the possibilities of chemical warfare, and such the urgency of stabilising peace.

The general expansion of the chemical industry since 1918 has increased its war potential. The explosives section of the industry has likewise expanded, many of the intermediates, and particularly the relatives of the explosives proper, having far greater pacific markets than was the case. Intermediates are essential compounds required at various stages before the final product can be produced. Great profits are made in this branch, and particular regard should be paid to the fact that the exports of military ammunition rose from 1924 to 1930 by 32 per cent. to 50.6 per cent. of the total manufactured, whilst 20.8 per cent. of the high explosive manufactured by private firms is exported.

This analysis of the chemical industry takes cognisance of the fact that the major basis for poison gases, chlorine, is a product with legitimate pacific uses, and that the intermediates and even the relatives of war explosives, are industrial needs. The industry is bound together fairly closely, and the points of possible diversion are debatable, but an attempt is made to show the most practicable forms of diversion, either for state control or for licensing of exports.

The order in the following sections is as follows:—

The first section deals with the manufacture of chemical warfare agents, poison gases and the like, with fairly full detail of the chlorine position, and the second section with the explosives, the intermediates and the position of the towns' gas, coke oven and dyestuffs industry in relation thereto. Later this information, preceded by a survey and a description of the existing organisation of the industry, is used as the basis of the problems which it is argued are essential for consideration by the Royal Commission.

The chemical industry is one which by the rapid advancement of scientific knowledge has become the backbone of all military effort, able within the law to deal in implements of warfare capable of the destruction of our civilisation, and supplying those means in vast quantities to the storm centres of the world. Its activities are encouraged by governments because of the increased war potential placed within their borders consequent upon that trade, but the industry is left to use its own means of securing its markets for these war products.

(2) THE MANUFACTURE OF CHEMICAL WARFARE AGENTS.

(Poison gas and the like.)

The manufacture of chemical warfare agents demands the existence of a heavy chemical industry, which is more important for this purpose than the fine chemical industries. These heavy chemicals are such substances as sulphuric, nitric and hydrochloric acids, liquid chlorine, bleaching powder, caustic soda and soda ash.

The details of the manufacture of these materials are given elsewhere in this paper but it should be stated that the primary raw materials are:—

Coal,
Limestone,
Salt,
Sulphur or sulphur compounds,

given these, and the necessary agricultural resources to yield alcohol, not only the important marketable chemicals can be produced (both organic and inorganic) but also most of the important war gases. The only additions to this list to make it complete

for war gas manufacture are white arsenic and bromine.

The resources of our country are ample for coal, limestone and salt production. We import sulphur from America and Italy or in the form of iron pyrites (iron sulphide) from Spain.

The immediate raw materials or industrial chemicals required, are listed below:—

Common salt,
Chlorine,
Carbon monoxide,
Bleaching powder,
Picric acid,
Sulphur chloride,
Ethylene or Alcohol,
Acetylene,
Arsenious oxide,
Benzene,
Methyl Sulphate,
Bromine,
Sodium nitrate,
Sulphur Dioxide,
Hydrochloric acid.

All these materials have great pacific uses, or are used in the manufacture of pacific industrial materials.

Some of the poison gases have legitimate pacific uses, for example chlorine, which is dealt with in detail under the heading of "The production of chlorine".

The demand for war-time poison gas manufacture is shown in Schedule I which is the detail of output of the Edgware Arsenal, U.S.A., for 1918.*

SCHEDULE I.

Schedule of Production 1918.

Edgware Arsenal, U.S.A.

Raw Materials.

	Material.	Weight Lb.
1.	Salt	17,358,000
2.	Bleach	42,384,000
3.	Picric acid	3,718,000
4.	Sulphur	24,912,000
5.	Sulphur Chloride	6,624,000
6.	Alcohol	3,718,000
7.	Bromine	238,000
8.	Benzyl Chloride	26,000

Production and Shipments.

	Material.	Production Lb.	Shipped Lb.
1.	Chlorine, liquid	5,446,000	2,976,000
2.	Chlorine, gaseous	2,208,000	—
3.	Chloropicrin	5,552,000	3,806,000
4.	Phosgene	3,233,000	840,000
5.	Mustard gas	1,422,000	380,000
6.	Bromobenzyl Cyanide	10,000	—

These outputs are fractional in comparison with our modern resources.

Schedule II is a summary of the various poison gases and liquids known to the chemical industry as being useful in war, and a detailed description of each gas, its manufacture from certain raw materials, its toxicity and commercial uses if any are given in detail, together with a classification list of these gases.

In addition Flow Sheets P.G.2-9 (Figures 6A-6D) give the manufacturing method and place of use of each raw material or re-agent.

It will be obvious that from this information a schedule of gases can be compiled that will enable a licensing scheme or alternatively a scheme for state control to be worked out in a general fashion.

The Classification of Chemical Warfare Agents.

The classification of the most efficient known compounds is given below:—

* Quoted from *Chemical Warfare* by Fries West 1921 (McGraw Hill Book Co.).

1. *Tear gases or lachrymators.*

These are not lethal except in high concentrations, but are used for disabling by causing a profuse flood of tears:

- (a) Benzyl Bromide.
- (b) Xylol Bromide.
- (c) Bromacetone.

2. *Lung irritants (lethal).*

- (a) Chlorine.
- (b) Phosgene.
- (c) Chloropicrin.

3. *Blistering gases or vesicants.*

These are intensively poisonous, but used against protected persons disable rather than kill.

- (a) Mustard gas.
- (b) Lewisite.

4. *Sensory irritants or sneezing gases (not essentially lethal).*

- (a) Arsenical smokes.

5. *Paralysants (lethal).*

- (a) Prussic acid gas.
- (b) Sulphuretted hydrogen.

SCHEDULE II.

Poison gases—Summary of reagents for manufacture.

Agent.	Made from.
1. Tear Gases.	
(a) Benzyl Bromide...	Benzen, Bromine.
(b) Xylol Bromide ...	Xylene, Bromine.
(c) Bromacetone ...	Acetone, Bromine.
2. Lung Irritants.	
(a) Chlorine ...	Common Salt.
(b) Phosgene ...	Chlorine and Carbon Monoxide.
(c) Chloropicrin ...	Bleaching Powder and Picric Acid.
3. Vesicants.	
(a) Mustard Gas ...	Sulphur Chloride and Ethylene.
(b) Lewisite ...	Acetylene and Arsenious Chloride.
4. Toxic Smokes.	
(a) Diphenylchloroarsine.	Benzene, Sodium Nitrate, Hydrochloric Acid, Sodium Arsenite, Sulphur Dioxide.
(b) Methylchloroarsine.	Sodium Arsenite, Methyl Sulphate.

The requirements of a lethal war gas.

The essential requirements are:—

- (1) Must be highly toxic.
- (2) Must be capable of ready manufacture in large quantities.
- (3) Must be readily compressible to a liquid and yet be easily volatilised when the pressure is released.
- (4) Should be considerably heavier than air.
- (5) Should be stable against moisture and other chemicals.

Survey of manufacture.

The manufacture of these poisons is completely dependent upon the heavy chemical industry for chlorine and hydrochloric acid. The heavy chemical industry requires expensive plant and is not readily capable of expansion, but the manufacture of the lethal substances from organics and heavy chemicals is very simple and does not require more than the normal equipment of any chemical works.

Few of the lethal substances have any commercial use, therefore the complete prohibition of manufacture raises no serious industrial problems. The existing chemical warfare station of H.M. Government is quite capable of carrying out the research necessary, and of preparing plans to utilise the existing chemical factories with trifling delay in time of war, so that, with exception to chlorine par-

ticularly and in a lesser degree phosgene, the problem of sale prevention should not exist in the minds of any reasonable persons.

The ease of manufacture from the intermediate materials makes it essential that all these intermediates that have a small pacific use should be most strictly controlled, and in some cases completely prohibited. Upon this basis the suggested schedules of licensing and prohibition have been compiled.

Since chlorine manufacture is of such fundamental importance, a complete description is given of its manufacture. The memorandum aims at illustrating the relationship between raw materials and chemical products as well as the possibility of expansion of the industry to meet a large increased demand. A detailed description of the use of chlorine in the final stages of lethal substance production has not been given.

The production of chlorine.

The process as seen in the flow sheet, Figure 7, is based upon the electrolysis of brine and presupposes the existence of salt in quantity and of cheap power. Previously existing methods of manufacture of alkalis by chemical reaction used little power, but heat as steam, in quantity, whereas the electrolytic method demands a very high power production at a cheap rate and requires only about 2 per cent. of the steam generated for heating purposes. The advance of the electrolytic method is therefore due to the technical progress of power production.

Prior to the War, only one plant of this kind was in service in Great Britain, that being the Castner Kellner Alkali Co. at Runcorn, Cheshire, and it was from this source, and from Levinsteins, the dyestuffs manufacturers (both now part of I.C.I.) that much of the chlorine and other poison gases was supplied to the Allied Powers.

Chlorine sale has been the paramount difficulty in the economics of the electrolytic alkali production, and the lack of market for its use resulted in the major portion manufactured being made in bleaching powder at a higher cost than that made by chemical reaction measures. It can be stated that the price of chlorine products was based upon the market price of caustic soda, which often enabled the chlorine product market to be below production cost.

Naturally this state of affairs was of serious importance to the electrolytic alkali manufacturers, and new uses for chlorine were sought. Certain developments such as that of the artificial silk industry provided a great market after the War, and the technical superiority of the use of chlorine instead of bleaching powder led to its use as a sterilising agent, which use is constantly increasing. In addition the lower transport charge for liquid chlorine (in terms of its effectiveness) as against bleaching powder or bleach liquor, makes it commercial for users of these materials to manufacture bleach liquor at their own works, from lime and liquid chlorine.

The export of chlorine is relatively small, there being difficulties of transport for reasons of safety and economic difficulties in the cost/usage time of the expensive containers, but an export trade is being developed and will need consideration.

A further effort to stabilise more completely the chlorine position is in the manufacture of non-inflammable grease or oil solvents such as trichlorethylene, which materials have their commercial outlet in fat extraction, dry cleaning, and the preparation of metals for painting and plating.

A very important tendency in artificial silk manufacture, cutting out the use of chlorine, will probably result in a reduction of output more than equal to any other possible commercial increment. In fact that reduction in the near future could result in the release for war purposes of a further 400 tons of chlorine per week, reducing the load factor of existing plants very considerably.

The position is further complicated by the balancing of sales of chlorine and caustic soda. Caustic soda is still the primary product. It can be readily stored in drums in very large quantities without much deterioration, but if there is a high demand for caustic soda, then the chlorine which is still

turned out in the same ratio, cannot be stored in quantity without prohibitive capital costs. Some alkali manufacturers are placed in difficulty by this, but the largest producer, Messrs. Imperial Chemical Industries, Ltd., attempts to meet this situation by diversion of the caustic soda supplies from its electrolytic to its chemical re-action branches. It can, however, be stated that the electrolytic alkali manufacturers have a normal and legitimate industrial market for chlorine and chlorine products up to the full commercial capacity, i.e., 60-70 per cent. of installed plant capacity.

In addition to being an industrial material, chlorine is a deadly poison gas, which can be used directly, and in its industrial containers for war purposes. It is also the primary raw material for the manufacture of most of the chemicals used in gas warfare.

Possibilities of War-time expansion of Chlorine Manufacture.

It would be very difficult to carry through any war time expansion, in view of the high capital charges and the nature of the equipment required. In general, the plant required, and the estimated war time delivery period is as follows:—

	Months.
Boilers and auxiliaries	10
Turbo-alternators	10
Electrical equipment	4
Cells	8
Compressors	4
Caustic evaporators	4
Buildings	4

It will be seen that the electrical power plant would require even under urgency, a period of twelve months to put into commission, and of course full use of existing power generating stations would be made, but even so, the huge power requirements for this process, and the fact that the electrical energy if supplied from the grid system, generated as alternating current, would need to be converted into direct current, would in practice make it an almost super-human task to build and operate a new factory within one year.

At present prices the erection of a factory to produce 1,000 tons of chlorine per week would be about £3 million and require a constant electrical load of 40,000 k.w.

The line of development therefore would be towards the rapid extension of existing factories, where trained personnel are available for this difficult work. Even so, development of plant capacity would be slow. It should be understood that chemical processes such as these are continuous, and no addition can be made by overtime working excepting that in preparing plant for overhaul or repair. In time of stress it would be impossible to increase the maximum output figure from 2,100 tons of chlorine per week to 2,500 tons without uneconomic working.

The rational method of increasing war time availability would be to cut down chlorine usage in those industries of secondary importance in war time.

Estimates of Chlorine production.

The following estimates are not exact, but the total available productivity will be found to be within 10 per cent. error.

	Tons Chlorine / week.		Tons Chlorine / week.
	Normal.	Continuous maximum	
Totals ...	1,750	2,100	350
Ratio ...	5	6	1

It must not be assumed that these quantities could be released for war purposes. The industrial demand would to a great extent be met with bleaching material from other processes, but some would be supplied with chlorine. Over 1,000 tons per week

could be released for warfare, mainly at the expense of the textile and paper industries.

The fact that this method of chlorine production is normally carried out in conjunction with that of hydrochloric acid and sometimes of sulphur chloride, both intermediates for poison gases, should be noted.

A list is now given of the main poison gases as well as a brief description of their properties, the main raw materials and intermediates and their commercial uses, if any.

Detailed Description of Poison Gases.

Lachrymators.

1. Benzyl and Xylol Bromides ($C_6H_5CH_2Br$, etc.).

(a) *Properties.*—Both are colourless liquids boiling over $200^{\circ}C$. One part per million in air causes profuse lachrymation.

(b) *Manufacture:*

(i) Raw materials.—Bromine and benzene or xylene.

(ii) Method. Mix and allow reaction.

(c) *Commercial uses.*—None, but bromine is used in the dye industry for making lead tetraethyl, for medicines, and for photographic chemicals.

2. Bromoacetone ($CH_3Br.CO.CH_3$).

(a) *Properties.*—A water clear liquid boiling at $127^{\circ}C$.

(b) *Manufacture:*

(i) Raw Materials. Acetone and bromine.

(ii) Method. Mix and allow reaction.

(c) *Commercial uses.*—None. Acetone is used largely as a solvent in the manufacture of explosives. It is also used in making chloroform. It is prepared (a) by passing the vapours of acetic acid through hot tubes containing a catalyst, (b) by bacterial decomposition of maize, and (c) from isopropyl alcohol.

Lung Irritants.

1. Chlorine (Cl_2).

(a) *Properties.*—A yellowish-green gas $2\frac{1}{2}$ times heavier than air, soluble in water. Chlorine condenses to a liquid when its temperature is reduced to $-34^{\circ}C$ or when at normal temperature the pressure upon it increases to 100 lb. per square inch. It is marketed as a liquid under pressure in strong steel cylinders, or in tank-wagons.

(b) *Manufacture.*—This is fully detailed in the special description of this important process. Simply the process is to electrolyse a solution of common salt, chlorine gas coming off at the positive pole.

(c) *Commercial uses.*—These are fully detailed in the special description. Briefly, as liquid chlorine for bleaching and sterilising, and for the manufacture of bleaching powder, hydrochloric acid and many organic products.

(d) *Toxicity.*—Lethal dose $2\frac{1}{2}$ milligrammes per litre of air, kills a dog in $\frac{1}{2}$ hour.

2. Phosgene ($COCl_2$). Carbonyl Chloride.

(a) *Properties.*—A colourless gas; liquefies at $8^{\circ}C$. Odour suggestive of green corn or musty hay. Is $3\frac{1}{2}$ times heavier than air. Extremely poisonous 25 parts volume in one million parts of air is fatal. It is marketed in steel cylinders, at a pressure of 90 lb. per square inch and normal temperature.

(b) *Manufacture:*

(i) Raw materials. Chlorine and Carbon Monoxide. (The carbon monoxide is formed by the burning of carbon in a limited air supply. It is also a waste product of many processes. It is used for many pacific purposes, such as the production of formates.)

(ii) Method. $CO + Cl_2 = COCl_2$. A mixture of chlorine and carbon monoxide is passed through a box containing charcoal, which acts as a catalyst.

(c) *Commercial uses.*—Relatively small. Used for certain dyes, e.g. crystal violet. Also used in making synthetic essence of violets, to a smallish extent in making certain kinds of glass, and sometimes for exterminating rats and moles.

(d) *Toxicity*.—Eight times as toxic as chlorine. A dose of 0.3 milligrams per litre of air kills a dog in 30 minutes.

3. Chloropicrin. (CCl_3NO_2).

(a) *Properties*.—A colourless oil boiling at 112°C . Insoluble in and heavier than water. A very stable compound. Used for warfare in gas shells. It is a lachrymatory as well as an irritant.

(b) *Manufacture*:

(i) Raw materials. Bleaching Powder and Picric Acid.

(ii) Method. By blowing steam through a mixture of bleaching powder and picric acid Chloropicrin passes over with the steam and is condensed.

(c) *Commercial uses*.—These are very few though its use as a fumigant against insects has been suggested. Picric acid is however used as a dye and an explosive. It is prepared from benzene or carboic acid by the action of nitric acid.

Vesicants.

1. Mustard Gas.—Dichlorethylsulphide. $(\text{CH}_3\text{CH}_2\text{CH}_2)_2\text{S}$.

(a) *Properties*.—This is not a gas, but an oil boiling at 200°C . When pure it solidifies at 14°C . It is almost insoluble in and heavier than water.

(b) *Manufacture*:

(i) Raw materials. Alcohol, sulphur and chlorine. From these are prepared ethylene and sulphur chloride which form the immediate raw materials for mustard gas.

(ii) Method.—Ethylene is passed into a solution of sulphur chloride in previously prepared Mustard Gas. (This is the best and British method.) $2\text{CH}_2 = \text{CH}_2 + \text{S}_2\text{Cl}_2 = (\text{CH}_2\text{CH}_2\text{CH}_2)_2\text{S}$.

(c) *Commercial uses*.—None. Of the raw materials ethylene is of great use in the organic chemical industry, and sulphur chloride is a liquid used in vulcanising rubber.

(d) *Toxicity*.—It is used as a vesicant, but the vapour is very poisonous—about equivalent to phosgene. The death rate however is very low, with trained soldiers only being less than 1 per cent. of the cases treated.

2. Lewisite or "Dew of Death".—Chlorovinylchloroarsine ($\text{CHCl} : \text{CH} : \text{AsCl}_2$). Mixed with β , β' -dichlorodivinylchloroarsine. This poison was discovered just before the armistice in 1918, but was not used in the war.

(a) *Properties*.—A colourless or faintly yellow liquid of high boiling point.

(b) *Manufacture*:

(i) Raw materials. Acetylene, arsenious oxide, and sulphur chloride.

(ii) Method.—Acetylene is bubbled through a mixture of arsenious chloride and aluminium chloride, the latter being a catalyst.

(c) *Commercial uses*.—None. Acetylene is of great use to the organic chemical industry for the manufacture of acetic acid and solvents. Sulphur chloride is used for vulcanising and for artificial silk. Arsenious oxide is used for making catalysts, pigments, glasses and medicines such as salvarsal.

(d) *Toxicity*.—This is a vesicant much worse than poison gas, since it is absorbed by the skin, rapidly causing death. It is also a powerful respiratory poison. It is six times more toxic than phosgene, a lethal dose being 0.05 mg/litre.

Sneezing Gases.

1. Diphenylchloroarsine ($\text{C}_6\text{H}_5)_2\text{AsCl}$. Or Sneezing Gas or Blue Cross.

(a) *Properties*.—A colourless solid melting at 44°C .

(b) *Manufacture*:

(i) Raw Materials. Benzene, sodium nitrite, sodium arsenite, sulphur dioxide.

(ii) Method.—This is an extremely complicated method and series of reactions.

(c) *Commercial uses*.—None, but all raw materials have pacific uses.

(d) *Toxicity*.—This material is sent over in shells, and upon bursting clouds of very fine particles of diphenylchloroarsine are formed. These penetrate any gas mask, which cannot stop fine particles, though it can by reaction stop gases. The subject sneezes so badly that he must remove the mask. He is then killed by other gases sent over simultaneously. In high concentrations the substance itself is dangerous.

2. Methylchloroarsene.

(a) *Properties*.—This is a liquid boiling at 132°C .

(b) *Manufacture*.—The raw materials are caustic soda, arsenious oxide, methyl sulphate and sulphur dioxide. Methylsulphate is a valuable reagent in industrial organic chemistry.

Paralysants.

1. Prussic Acid and Sulphuretted Hydrogen.

Neither of these chemicals was used much during the War. Prussic Acid is of great commercial use in fumigation. Sulphuretted Hydrogen is not used commercially, and is not deliberately manufactured. It is a by-product in certain processes, and could be very readily manufactured.

These gases are those that were found to be the most efficacious, and capable of cheap manufacture in large quantity. In fact, however, during the last war thirty different gases, and sixteen mixtures of these gases were used by the belligerents.

(3) EXPLOSIVES, AMMUNITION AND INTERMEDIATES.

From the study of poison gases it might appear that the function of explosives had become a minor one. It is agreed that the lethal process by explosives alone—by the application of energy release, and the imparting of violent velocity to metal, and thus to the body—is not so modern as is the attack of chemicals upon the lungs of man. Even so, we have shown that explosives will still be needed for the transmission of the projectile from the gun, and for the shattering of the shell case to release the gases.

In addition, however, we must make this point quite clear. Explosives are, in peace time, made in great quantities and exported to warring nations which have not yet advanced sufficiently in their civilisation to be able to control the more modern weapons of war. Thus they retain, for the purpose of this Inquiry, a greater importance than that of gases.

The manufacture of explosives covers a very wide field of chemical effort, much of which is completely free from any suspicion of interest in the supply of armaments. These factories and processes are those which deal with the manufacture of intermediates, or of materials which are near relations of those in the explosive groups.

The important explosives under review are cordite, the propellant, and T.N.T. or tri-nitro-toluene, the high explosive used for filling the shell. In addition to these we have many other industrial and military explosives, but most of them are based upon the use of some proportion of T.N.T.

The range of industries engaged in the production of chemicals which are intermediates for explosives is wide enough to embrace gas works, coke oven plants, and soap works in addition to chemical works proper, and to the factories engaged in making shell. Even so, these industries are not armament industries. After the last war there was a search for pacific uses for plant then available, particularly for T.N.T. plant, and cellulose nitrated to a lesser degree than T.N.T. is now used for a whole range of innocent materials such as laquers.

Perhaps the most important result of war research was that of the late Professor Haber of Berlin, upon whom, in consequence of the German shortage of saltpetre, fell the task of producing nitrates from atmospheric nitrogen, that great reservoir of the explosives industry. The practicability of the method has led to the establishment of a large plant in this country and as a compliment to its importance a

separate descriptive section has been allocated in our list of manufactures, to the process of ammonia synthesis.

The research made upon explosives is so complete as to make any great step forward very doubtful. It is unlikely that materials much more suitable to war purposes than cordite and T.N.T. will be discovered.

As an illustration of the type of equipment necessary for the manufacture of cordite, which, with T.N.T., is the basis of the explosives industry for war, we give a complete flow sheet of manufacture, together with quantities, from the raw materials to the finished product (Figures 8 and 9). This method of presentation serves a useful purpose in showing the co-ordination of the manufacture and use of the heavy chemicals and organics.

The raw material quantities for the production of cordite, and the intermediate industrial commodities used are shown. The details of manufacture of T.N.T. (tri-nitro-toluene) are similar, and to make the list complete for all seriously warlike uses toluene, picric acid and acetone would be the only additions. Some conception of the scale of raw material needs is shown by the figures of output of H.M. Factory, Gretna, which produced at the rate of nearly 28,000 tons of cordite per annum during 1918. The factory included in its own boundaries the whole process of manufacture of cordite from the raw materials. It was essential at that time to do so, but in post-war years our chemical industry has advanced from the 1914 level.

It would appear reasonable to assume that any efficient organisation for military purposes would base its arsenals upon the use of the intermediate reagents rather than upon the building up of an inflexible factory in which all the processes were carried through from the raw materials, unless the heavy chemical output could be sold in peace time whilst the explosive manufacture proper was in abeyance. Explosives cannot be stored in quantity over long periods without deterioration.

The regulation pre-war cordite was named M.D. Cordite. Its production necessitated the use of acetone, the supply of which had to come from overseas. R.D.B. Cordite is composed of nitroglycerin, "soluble" nitrocellulose and mineral jelly, whilst M.D. Cordite contained "insoluble" nitrocellulose or gun cotton. R.D.B. Cordite enabled ether-alcohol to be used instead of the scarce acetone, as the solvent or gelatiniser.

The R.D.B. Cordite was evolved in the Research Department at Woolwich Arsenal, and the work required to make this cordite gave the essential ballistics of M.D. so that cartridge cases, guns, etc., needed no alteration, is an outstanding success of Governmental research.

It was this cordite that was made at H.M. Factory, Gretna.

Raw material quantities for the production of 100 tons R.D.B. Cordite.

(a) Crude sulphur	tons	42.7
(b) Crude saponified glycerine	80	
per cent.		
(c) Crude sodium nitrate	"	24.1
(d) Mineral jelly	"	110.4
(e) Alcohol	"	6.2
(f) Raw cotton waste	"	60.0
(g) Soda ash	"	36.0
(h) Coal (process only)	"	3.1
(i) Iron ore	"	106.1
(j) Caustic soda	lbs.	286
(k) Stassfurt black	"	69
(l) Electrical energy	Kwh.	165,000

Intermediate industrial commodities produced and used in the process.

- Sulphuric acid.
- Nitric acid.
- Nitre cake—rejected.
- Diethyl ether ($C_2H_5)_2O$.
- Refined glycerine.

Trinitrotoluene: T.N.T.

This explosive is the safest one in use as a high explosive, as distinct from cordite, which is a propellant. It is much more insensible to detonation than is picric acid, which it has largely replaced. Figure 10 shows the process of manufacture in relation to the coal gas and dyestuffs industries, and from that diagram the derivation from coal tar of both toluene and xylene (used for tear gas) makes clear the importance of the gas industry to warfare.

This industry is not of course concerned with munition manufacture, but supplies the intermediate organic materials, whilst the dyestuffs industry uses those intermediates for the manufacture of its final products.

In addition to its use as a final material, T.N.T. is mixed with other ingredients, such as ammonium nitrate, potassium chlorate, starch, wood meal, aluminium wool, resin, lead nitrate, and even castor oil, whilst D.N.T. or dinitroloene is also used as an explosive.

Quantities and cost of production.

H.M. Factory, Gretna, produced in the six months ending 29th June, 1918, 13,884 tons of cordite at an estimated value of £3,000,000 (£260 a ton, 2s. 4d. a lb.).

H.M. Factory, Queen's Ferry, produced in 1918 100 tons of T.N.T. per day, or 35,000 tons per annum.

The following table shows British manufactures of explosives in H.M. Factories during the last war.

	Tons.
Picric acid	68,500
Trinitrotoluene	238,000
Ammonium nitrate	378,000
Cordite	139,000

Notes on various explosives.

1. Black gunpowder which is omitted from our schedule has the following composition:—

	Per cent.
Potassium nitrate	75
Sulphur	10
Charcoal	15

It is now practically obsolescent for military use. The ballistic power of gunpowder is a quarter that of cordite.

2. The number of available explosives is immense, and the majority have industrial uses, particularly in quarrying and mining operations. It would be impossible, outside of a full book on this subject only, to specify them all. These explosives will vary in their ballistic power, being some safeguard against their use as military propellants, which in consequence of the necessity of standard effectiveness, are limited. Apart from propellant use, however, all of them are suitable for destructive warfare.

A few of the more important explosives are here named:—

- (1) Sodium nitrate mixtures.
- (2) Barium nitrate mixtures.
- (3) Potassium nitrate mixtures.
- (4) Ammonium nitrate mixtures (electronite, ammonite, etc.).
- (5) Chlorate mixtures.
- (6) Perchlorate mixtures (permonite, cheddite, etc.).
- (7) Nitrotohuenes (T.N.T., etc.).
- (8) Nitrophenols.
- (9) Picrates.
- (10) Nitroglycerines.
- (11) Dynamites (nitro-glycerine with various earths).
- (12) Nitro-celluloses.
- (13) Gun cotton.
- (14) Fulminates.
- (15) Nitro-starches, etc.

Commercial uses of cellulose nitrates.

It is the degree of nitration which determines the value to the explosives industry of cellulose nitrates, and there is practically no pacific use for a compound of over 12 per cent. of nitrogen. Almost any

highly purified cellulose is suitable for nitration (in other words almost any vegetation), but in practice cotton linters have been found to be the most suitable for laquers, explosives, etc., but there is no inherent improbability of wood pulp or of other pure cellulose being employed, as is the case in artificial silk.

The earliest use of cellulose nitrate was for explosives and in its more highly nitrated forms, but modern uses of lower nitrated mediums—the so-called pyroxalines, collodions, and photographic nitro-cellulose—is giving a rapidly increasing market. The range of degree of nitration is from 14.16 per cent. downwards to 11.1 per cent.

Excepting for smokeless powder, the dry cellulose nitrates have few applications.

The cellulose nitrate formulae are:—

$C_{12}H_{12}O_{12}(NO_2)_8$	— 11.1% nitrogen	} Industrial.
$C_{12}H_{12}O_{12}(NO_2)_9$	— 11.96% "	
$C_{12}H_{12}O_{12}(NO_2)_{10}$	— 12.7% "	
$C_{12}H_{12}O_{12}(NO_2)_{11}$	— 13.5% "	
$C_{12}H_{12}O_{12}(NO_2)_{12}$	— 14.3% "	

Nitro celluloses are used in the following industries:—

- (1) As laquers in all industries using protective paint coatings.
- (2) Artificial and synthetic camphors.
- (3) Paint removers.
- (4) Imitation leather and fur.
- (5) Gas mantles.
- (6) Silks.
- (7) Celluloid.
- (8) Plastics and resins.
- (9) Medical use of collodion compounds.
- (10) Photographic use of collodion compounds and many similar uses.

Intermediates for explosives.

Sulphuric acid or oleum. (H_2SO_4).

This acid is of immense importance in explosive manufacture and general industries.

It is worth while to note that this material, originally made from imported sulphur or from pyrites is now increasingly manufactured from spent oxide (gas works) and zinc concentrates. The imports and consumption are as shown in the following table:—

Imports, etc., U.K., July, 1926—June, 1927.

Materials.	Import.	Consumption.	Per cent. as sulphur.	Per cent. as sulphur in 1914.
	Tons.	Tons.		
Pyrites ...	244,000	235,000	46.3	89.0
Sulphur ...	870,750	58,000	23.0	0.3
Spent oxide ...	—	120,000	24.0	10.6
Zinc concentrates.	—	66,765	6.7	0.15

The oleum (strong sulphuric acid) output was in 1918 at the rate of 11,500 tons per annum, which was the main source of British output. In addition the plant capacity for 20 per cent. oleum in Great Britain had been increased from 25,000 tons/annum in 1914 to 450,000 tons/annum in 1918.

We are thus coming to rely on our own resources to a greater extent. The market for sulphuric acid is not an increasing one, but in this country, particularly on the initiative of I.C.I., the largest sulphuric acid plants, particularly those at Oldbury, have been extended and modernised. The plants in this country are operating at about 60 per cent. of capacity, which is a reasonable commercial load factor.

Probably 50 per cent. of the output is now used in conjunction with ammonia for fertiliser manufacture.

The increase in plant capacity which would be required in war time, would in common with the other heavy chemical industries, depend upon diversion of products and overload capacity, but there

appears to be a decline in the use of sulphuric acid of late years.

In 1930 the quantity of crude glycerine available to the explosives industry is stated in the Final Report on the Fourth Census of Production to be 256,000 cwt. as against 68,000 cwt. in 1924, an increase of 387 per cent.

Glycerine is a by-product of soap manufacture and is manufactured in the main by Lever Bros. (Capital £70,000,000.)

Picric Acid.—Phenol is sulphurated resulting in phenolsulphonic acid and nitrated by addition of strong sulphuric and nitric acids. Picrates are too dangerous to handle and relatively little would be used in future wars.

Alcohol is obtained by the distillation of the fermented wash liquor or mash of any vegetable substance. Many substances are employed, such as rye, barley, potatoes. Ethyl alcohol is required for explosives manufacture, and in the final higher boiling point distillations of potato mash, i.e., in the used oil, about 49 per cent. by weight of ethyl alcohol is found.

There was an enormous increase in the spirits manufacture for industry from 1924 to 1930, the figures being: 1924—696,000; 1930—6,284,000 proof gallons, being an increase of 900 per cent.

The Synthetic Ammonia or Nitrogen Fixation Industry.

The production of one ton of fixed nitrogen, as ammonia, requires the theoretical consumption of 480 lbs. or 92,000 c. ft. of hydrogen. One third of this volume of nitrogen is required. The production of hydrogen is simple, requiring only coal for power and water for electrolysis, or through coal to water gas. The nitrogen required for the process is obtained from air, which is composed, ignoring impurities, of 20 per cent. oxygen and 80 per cent. nitrogen, by the elimination of the oxygen or by the liquification of air.

The process results in the production of ammonia gas (NH_3) which is sold either as a gas or as liquid ammonia, NH_4OH (a solution of the gas in water), or is converted into sulphate of ammonia, or alternatively is oxidised to nitric oxide and nitric acid. This oxidation process is not economical, and would only be carried out for war purposes.

During the last war the German output of synthetic ammonia reached a peak in 1918 of 650 tonnes per day (640 tons) or 230,000 tons per annum. The United States War Department's estimate of military demand alone is 150,000 tons per annum for a first class war.

During the last war no synthetic nitrogen plants were available for the Allies, the alternative source of Chilean saltpetre being employed.

In war time nitrogen is required both for cordite and T.N.T. In peace time the main market must be found in agricultural fertilisers, as sulphates and phosphates of ammonia, though new uses are constantly being sought.

During the last war the British Government attempted to inaugurate a synthetic nitrogen plant at Billingham. The plant was not successful and was afterwards sold to Messrs. Brunner Mond & Co. (later I.C.I.). Researches and inspection undertaken by the Inter-Allied Commission in Germany with Brunner Mond personnel (Col. Pollitt, for example) resulted in further knowledge, and after the setting up of semi-technical scale unit at Billingham, a pilot plant was installed at the Castner Kellner Alkali Co., Runcorn, which was put into commission. Upon the data thus obtained, the great plant at Billingham was designed and brought into successful operation.

The Billingham and Runcorn plants are the only plants in Great Britain working on ammonia synthesis, though it must not be overlooked that ammonia is a by-product of gas manufacture, and that there is a larger output from that source than from synthesis.

At the time that the plant at Billingham was designed most technicians in the industry were of the opinion that the magnitude of the proposed production was on a scale far too ambitious, and their view has been substantiated in practice. It would appear that a mistake in policy was made, as it is difficult to envisage in what way the Government could subsidise the plant equipment from loss in order to have the available capacity.

The plant is at present producing at the rate of 300 tons per day or about 110,000 tons per annum, but it is capable of increasing this output by about 100 per cent.

In common with most of the newer chemical processes, the chief raw material is coal, and very expensive plant, capable of withstanding high temperature and pressure is called for, linking up this and similar processes with the demand for heavy steel forgings such as are required for heavy armaments.

War-time capacity.

Fortunately, or otherwise, plant capacity in this case is great enough to meet an increased demand of 100 per cent. without additional plant requirements.

Nitrogen fixation plant costs.

The water gas process is that usually employed, and these figures are based upon that process for the fixation of 40,000 tons N_2 (Nitrogen) per annum, which plant size is as small as an economic unit should be.

Division.	£
1. Gas Manufacture	620,000
2. Compression and Purification	640,000
3. Complete Synthesis plant	575,000
4. Plant facilities and services	920,000
Total	2,755,000
Cost per ton N_2 per annum	69

A similar plant, but based upon the electrolytic production of Hydrogen would cost:—

Division.	£
1. Gas Manufacture	286,000
2. Compression and Purification	232,000
3. Complete Synthesis plant	490,000
4. Plant facilities and services	870,000
Total	1,878,000
Cost per ton N_2 per annum	47

The probable cost of the ammonia synthesis plant at Billingham, excluding the other industries situated there is £12 million, the plant as a whole costing about £25 million. The smaller units might be termed "of strategic size".

The increase in manufacture of ammonium sulphate possible consequent upon the Billingham extension is shown in the following table from which it will be seen that the output has increased by 8½ times.

	1930.		1924.	
	Quantity	£	Quantity	£
Sulphate of ammonia	Tons 351,700	2,120,000	Tons 41,000	498,000

From "Fourth Census of Production (1930)" Part III, 1934.

The Gas Works supplies (Toluene).

A properly organised Towns' Gas Works is also a chemical works in the strict sense of that term, the by-products of gas manufacture being recovered and sold, these by-products being quite as important as the supply of gas is to the balance sheet of the industry. Some of the by-products are:—

Sulphate of Ammonia.
Muriate of Ammonia.
Carbolic Acid.
Benzol.
Toluol.
Xylol.
Naphtha.
Naphthalene.
Anthracene.
Creosote; etc.

Amongst these products will be seen Toluol and Xylol, the former necessary to the manufacture of T.N.T., and the latter for lachrymatory gas. These materials are available from most of the gas works and of the coke oven plants in this country, and the available quantities are very great, 493,000 gallons of Toluol being produced in 1930.

Small Arms Ammunition.

It is necessary to consider the manufacture of small arms ammunition under a survey of the chemical industry because, firstly the manufacture of the cases is practically automatic, and not an engineering matter, and secondly, because the chemical industry does in fact control this manufacture.

There is a considerable difference in the manufacturing methods for shell cases, etc. and rifle ammunition. The former are usually of steel and up to 6" diameter can be turned on practically any lathe in the country, as was shown in the last war. Rifle ammunition manufacture is a completely automatic process in which brass strip, without further handling passes through all operations to the finished case, and is even automatically gauged for accurate manufacture, non-standard cases being rejected.

It is advisable that the process of filling and finishing should be concluded in the same factory where the cases are manufactured, though it is not strictly essential, and the separation of this automatic production task is not proposed for separation from the explosives industry.

The actual manufacture of the major portion of the small arms ammunition in this country is carried out by I.C.I. Ltd. through its subsidiary company I.C.I. (Metals) Ltd., and mainly at the Kynoch factory.

This factory operates in conjunction with others of the same group to produce a variety of non-ferrous metal plates, strip, tubes and wire, even the manufacture of the famous "Zip" fastener being in the same works area.

The cartridge works is contiguous to the others, and the factory produces sporting ammunition in addition. Sporting ammunition is mainly for shot guns, and the whole process of manufacture is completely different from that of rifle ammunition. Compressed paper forms the barrel of the shot gun cartridge, and even a printing works is attached to the plant which in addition to other works prints the paper for shot barrels.

There are many co-called "manufacturers" of ammunition, but in fact there is only one supplier worthy of the name of "manufacturer", and that is I.C.I. Ltd.

It is claimed as essential to any control of the arms industry that small arms ammunition manufacture be state controlled. The necessity for this is shown in the following table.

Small Arms Ammunition (including empty cartridge cases).

Type.	Year.	Value.	Exports.	Exports.	Increase in Exports since 1924.
		£	£	Per cent.	Per cent.
Military	1930	379,000	192,000	50.6	32
	1924	422,000	162,000	38.4	
Sporting	1930	658,000	293,000	44.5	—
	1924	712,000	462,000	64.9	

From this table it will be seen that though the production value of military ammunition has been reduced by about 10 per cent, the exports have risen by 32 per cent. from 1924 to 1930.

Considerations involved in assumption of State Control.

The automatic machines used for military ammunition are intricate and costly, and whereas shell can be produced in any engineering shop, the mechanism for the smaller ammunition needs special manufacture. It is probable that these machines could be installed, and a factory be operating under war conditions in about six months, if plans were already prepared.

The difficulty of taking over this portion of the chemical industry with the explosives section only, under state control, is that the plant at present exists in the centre of a general works, and could not be efficiently operated as a separate organisational unit under the same roof. It would therefore be necessary to transfer both machines and labour to a separate factory, unless the control of the chemical industry was adopted.

The manufacture of small arms ammunition is not an essential part of the general scheme of I.C.I. organisation and could well be separated from the rest.

(4) THE EXISTING ORGANISATION OF THE CHEMICAL INDUSTRY.

Chemical factories, especially dyeworks and factories connected therewith, can be very quickly adapted to the manufacture of poison gases. In the dyeworks many of the intermediates are themselves lethal chemicals, which are capable of immediate use in chemical warfare, whilst others are intermediates for the manufacture of chemical warfare agents. A survey of this problem is given in records of Sub-Commission "A" of the Reparation Commission of the Disarmament Conference.

In addition to these questions of potential, we have to be cognisant of the fact that part of the industry is now taking great profits, not from their potential war utility, but from their present supply of explosive material.

Since it is the duty and purpose of the Royal Commission to report on the methods of control to be recommended either by nationalisation, inspection, licensing or other means, it is therefore essential to consider the possibility of separating the armaments side of this industry from its general industrial side.

Our problem will therefore be to separate (1) those industries supplying direct war material; (2) those capable of immediate interchange to war material; (3) those supplying intermediate products to existing armament firms; and (4) that part of the chemical industry which is only indirectly related to warfare production.

After consideration of these matters, the practicability of control will be discussed, and the problem is here complicated by the widespread control of certain of the large firms, who are at present engaged in producing explosive and pacific materials. Control may demand a spread to include sales services

to the pacific industries of relatives of explosives, and in such cases as glycerine production to the control of soap factories, which are essentially suppliers for pacific uses.

That being the case, the present organisation of the industry will require careful consideration before any practicable proposals can be matured.

Consideration of this structure should be preceded by a study of a work entitled *A History of the British Chemical Industry* by Stephen Miall (Ernest Benn. 1931). A concise story of the industry is here presented with authority, and the diagrams (Figures 11 and 12) show its past and present organisation, in the branches of heavy chemicals and dyestuffs.

In its widest scope the industry may be classified as follows:—

- I. Heavy chemicals.
- II. Dyestuffs.
- III. Explosives.
- IV. Drugs and fine chemicals.
- V. Cellulose.
- VI. Metallurgy.
- VII. Gas, coke and tar.
- VIII. Paints and varnishes.
- IX. Soap.
- X. Miscellaneous products, such as:—
 - (a) Cement.
 - (b) Plastics.
 - (c) Matches.
 - (d) Water softening.
 - (e) Linoleum.
 - (f) Paper.
 - (g) Salt.
 - (h) Glass.
 - (i) Electrical accumulators.
 - (j) Margarine.

Of these, heavy chemicals, dyestuffs and explosives come strictly within the limits covered by the work of the Commission. The fermentation industry supplies industrial alcohols in quantity, but that is a minor part of its duty, and the ramifications of the manufacture and sale of beverages is its major purpose. We will therefore not consider it in detail.

In the drug and fine chemicals branch there is some war potential, but it is as yet minor, and it is supplied with its intermediates by the heavy chemicals industry. Some of its factories are however engaged in the production of stannichloride, a chemical warfare agent, and such activities must come within our scope.

The cellulose industry, in those branches that are connected with gun-cotton and cordite, collodion, celluloid, etc., are without our purview, whereas those branches engaged in the production of artificial silk are inextricably connected with the textile industry.

Metallurgy is a practice of science with metals and apart from the chemical knowledge imparted thereto and the use of heavy chemicals, is a more fitting study for control in the engineering branch of industry.

Gas, coke, and tar are vital commodities in the production of poison gases and of explosives. The industry does not produce those finished materials for sale, nor is it in any financial link-up with the heavy chemicals organisation, selling its products through its central agency. The vast aggregate capital and the organisation of service to a huge consumption market, tends to outweigh its possibility of control within the terms of reference of the Commission. It must of course receive some consideration when co-ordination and licensing are under review.

Paints and varnishes are only partly co-related to armament production. In its lacquer branch it uses nitrated cellulose, in some cases manufactured in its own works and in others purchased as an intermediate. Consideration here therefore must be in the direction of control of manufacture or supply. Certain firms solely engaged in paint manufacture may be allowed to continue manufacture of nitrated cellulose, whilst others, operated by armament concerns, may be required to be placed under state ownership.

The soap industry is the supplier of glycerine for T.N.T. manufacture and for other peaceful purposes. The glycerine is a by-product and is not nitrated by the industry, which is primarily pacific in character, and has a total capital of probably £100 million of which £70 million is that of Lever Bros.

Left for our immediate consideration therefore, we have

- (1) Heavy chemicals.
- (2) Dyestuffs.
- (3) Explosives.
- (4) A portion of the "Fine Chemicals".
- (5) A portion of "Cellulose".
- (6) A portion of "Paints and Varnishes".

We believe that it will be generally agreed that we have not attempted in the foregoing analysis to widen unduly the scope of that part of the industry requiring consideration.

Now let us see who are the major firms engaged in these industries.

Heavy Chemicals.

- (i) Imperial Chemical Industries Ltd.
- (ii) Charles Tennant & Co. Ltd.
- (iii) Spencer Chapman & Messel.
- (iv) The Sheffield Chemical Co. Ltd.
- (v) W. Blythe & Co.
- (vi) F. W. Berk & Co.

Dyestuffs Industry.

- (i) Imperial Chemical Industries Ltd.
- (ii) Williams (Hounslow) Ltd.
- (iii) Charles Tennant & Co. Ltd.
- (iv) British Alizarin Co.
- (v) The Mersey Chemicals.
- (vi) Oxley Hird Ltd.

Explosives Industry.

- (i) Imperial Chemical Industries Ltd.
- (ii) Vickers-Armstrongs.
- (iii) H.M. Government.

For the sake of brevity, the lists are not complete, and the minor branches are unspecified, but it can be stated that except for fine chemicals, I.C.I. dominates the chemical industries quoted, though in paints and varnishes it is probably second in its use of nitrated cellulose to Messrs. Pinchin Johnson, who manufacture paint.

Some idea of the scope of the products is given in the following schedule of manufactures, which relates to the productions of I.C.I. in which prominence is always given to pacific products, and from which it will be seen that no mention is made of explosives and ammunition probably as a matter of policy.

The large number of products manufactured by I.C.I. companies make it possible to give only a brief list, of which the following are the most important.

Acids

Acetic
Benzoic
Chloroacetic
Formic
Hydrochloric
Muratic
Nitric
Oleum
Sulphuric

Aluminium Chloride (Anhydrous)

Ammonia

Anhydrous
Liquor (all strengths)

Ammonium Bicarbonate

Ammonium Carbamate

Ammonium Carbonate (Lump and Powdered, B.P. and Neutralising Qualities)

Ammonium Chloride

Fine white, granular
Grey Galvanisers crystals
B.P. Standard
"Dog Tooth" crystals
Sublimed Salammoniac
"Salamac"
"Voltoids"

Ammonium Nitrate
Ammonium Sulphate
Ammonium Sulphite
Benzoate of Soda
Benzoic Acid
Bicarbonate of Soda

Refined and Recrystallised B.P. Standard (All grades of fineness)

Mineral Water Quality

Bisulphite of Soda
Bleaching Liquor
Bleaching Powder, 35/37 per cent.
Bleaching Powder, Tropical Quality
Burnt Pyrites
Calcium Bisulphite
Calcium Carbonate
Calcium Chloride
Solid, broken, flake
Calcium Superphosphate
Carbon Bisulphide
Cattle Lick
Caustic Soda

Solid, flake, and liquor, all strengths
"Chemic"

Chloroacetic Acid
Chloride of Lime

Sanitary
"Staboclor"

"Chlorosene"

Chlorine (Liquid)
Chloroform B.P. Standard

"Chloros"
Chlorosulphonic Acid
Collodion Cotton
Collodion Solutions
Copper Cyanide
Copper Hydroxide
"Crex"

Dibutyl Phthalate
Dichloroethylene
Disinfectants
Dyestuffs
Ether (Methylated)
Ethyl Chloride
Ethylene Glycol

Ether
Ferrie Chloride (Liquid and Solid)
Ferrous Chloride
Fertilizers

Fluosilicate of Soda
Formic Acid
Fur Bases

"Galvene"
Glauber's Salts

Hexachlorethane
Hexachloronaphthalene ("Seekay" Wax)
Hydrated Lime

Hydrochloric Acid

All usual strengths including B.P. Standard

Hypochlorite of Soda
Hyposulphite of Soda (Sodium thiosulphate)
Commercial and photographic

Insecticides
Intermediates for Dyestuffs

Lead Nitrate

Lead Peroxide

Lead Sulphate

Lead Sulphide

Leather Oils

Lime

Burnt. All qualities

Hydrated

Lime Mud or Waste

Limestone. All grades

"Marvelite"

"Maxo"

Methanol

Methylated Ether
 Methyl Chloride
 Methylene Chloride
 Monochloronaphthalene
 Nitric Acid (all grades and strengths)
 Nitro-Chalk
 Nitro Cotton (Industrial)
 Ochres
 Oleum
 Paints and Varnishes
 " Pearl Dust "
 Pentachlorethane
 Perchlorethylene
 Phosgene
 Photographic Chemicals
 Potassium Cyanide
 Purple Ore
 Pyrites
 Pyroxilin
 Resins (Synthetic)
 Rubber Accelerators
 " Salamae "
 Salammonic
 Salt
 Rock, Ground
 Rock, Lump
 White (all qualities)
 Saltoake
 " Seekay " Soil Fumigant
 Sesqui Carbonate of Soda
 " Shirilan "
 Silicate of Soda (all grades)
 Soda Ash
 Light, heavy and special heavy
 Soda Crystals
 Various forms
 Sodium Metal
 Sodium Salts
 Bicarbonate
 Bisulphite
 Carbonate
 Chloride
 Cyanide
 Formate
 Hydrate
 Hypochlorite
 Nitrate
 Nitrite

It will have been noted that in every phase of the industry, the name of Imperial Chemical Industries is quoted constantly. This firm is in fact

in a controlling position in the chemical industry. In heavy chemicals, explosives and dyestuffs it is almost absolute, though firms such as Charles Tennant are of great size, but in fine chemicals it is the main supplier to the trade of the necessary intermediates. Some indication of this position is given in the diagrams showing the evolution of the heavy chemical and dyestuffs industries, and the same story can be told of explosives. Some few years ago the names of the firms engaged in the industry as major operators would have been increased by at least ten times.

I.C.I. is in the main a horizontal trust, with exception to its metals branch (I.C.I. Metals Ltd.) which deals in copper and similar non-ferrous metals, the making and filling of small arms ammunition. This branch is really a " carry-over " from the Nobel interests into the amalgamation.

It was obviously necessary to the chemical industry that this organisation should be formed so that the various branches would be able to exchange intermediates on a cost basis, and obviate the competitive manufacture of similar reagents on wasteful lines, as many processes were patented, and competitive manufacture resulted in great losses by the retention of inadequate processes. From the national point of view it can be stated that I.C.I. has organised and re-equipped the industry. The scope of the organisation is increasing constantly. Recently another large chemical firm, the Chemical and Metallurgical Corporation was purchased. The manufacture of oil from coal is a recent development carried out in I.C.I. by the hydrogenation process.

The industry is interlocked to a great extent by sales agreements and in some cases has common research organisations. The importance of the detailed examination of these sales agreements by the Commission has been already stressed, but it will be emphasised again.

The value of the industry in terms of capital, including heavy chemicals, dyestuffs, drugs, fertilizers, soaps, explosives, artificial silks and those parts of the gas works and coke oven plants engaged in by-product recovery is of the order of £300 million and about 170,000 workers are employed.

Messrs. Lever Bros. and I.C.I. together account for one half of the total. The commercial returns upon capital can be assessed from the balance sheets, accepting 6.8 per cent. dividend for example, in the case of I.C.I., or alternatively one can analyse the true situation, and find that obsolescences are often unduly low, and that the profits made are to a considerable extent from the explosives group. Balance sheets of the individual I.C.I. groups are not shown in the Annual Report. Thus, though I.C.I. is not primarily an armaments firm, yet, by force of circumstances (or of good salesmanship) its profits depend very greatly indeed upon the sales of high explosives and ammunition of which huge quantities have been exported to the Far East.

The position of the industry is not completely stable. Research now makes possible changes in technique such as that in the displacement of chlorine from the manufacture of artificial silk, which changes can upset the balance of the industry. Chilean saltpetre is again competing with synthetic fertilizers and reducing their output.

The safety of the industry does therefore depend upon a wide control of many processes, in order to minimise the effects of such reactions, and the more effective the organisational control is, both in management and in sales agreements with the ancillary industries, the more stable it will become.

This survey brings out clearly the fact that the lethal substances and the explosives section of the industry can, with the exception of the type of products mentioned, be separated from the general body of the industry on its technical side. Such, however, is the horizontal and vertical nature of this great chemical combine that no analogy can be made as far as the very important financial aspect of the problem is concerned. However, the financial side could be separated by special government enactment

rather by nationalising or placing government controlled companies in charge of the armaments section. It is essential that this control should be extended to the sales side as well as that of manufacture.

(5) THE INDUSTRY OF DEFENSIVE MEASURES AGAINST GAS ATTACKS.

In view of the great attention which is now being paid to the question of defence against gas warfare, it has been thought fit to add a short chapter on the production of the gas mask, which will undoubtedly be one of the methods advocated.

The gas mask is the normal means of protection against poison gases, and although it is not a perfect means, yet it is certain to be used in any attempt to protect the population or the armed forces.

It is not possible to evolve an efficient gas mask unless it is of the canister type. By that is meant that gas masks equivalent to the old P.H. Helmet (that is, textiles saturated with chemical) do not give any adequate protection, and it is necessary to have a canister type of mask which will embody wire and felt screens, and a container filled with activated carbon and a small quantity of chemical reagent.

These gas masks, of the type used as standard for industrial operations and for war purposes, are manufactured by Siebe, Gorman & Co. and are normally retailed to industrial buyers at £2 7s. 6d. each.

The apparatus may be divided into two portions, (1) the mask and inducing pipe, and (2) the canister.

It is quite possible to manufacture the canister, wire gauzes, felt, etc. in adequate quantities for the whole of our population with very short notice indeed, but the filling medium for the canister, about 98 per cent. of which is activated carbon, cannot so readily be manufactured. We calculate that the filling for 45,000,000 canisters would require 10,000 tons of activated carbon.

During the War there was a shortage of this material. The best raw material for the manufacture of activated carbon was found to be coconut shells, but it was found possible, towards the end of the war, to activate carbons of the anthracite type with a reduction in effectiveness to one-third or one-quarter of that of the carbon made from coconut shell. This better material was eked out in the proportion of one-third coconut shell carbon to two-thirds anthracite carbon in American gas masks.

Activated carbon has the property of absorbing poison gas to a tremendous extent in relation to its volume, and the small quantity of reagent used in conjunction with it would vary according to the types of gases met with. This chemical reagent (whatever it might be) could undoubtedly be manufactured in sufficient quantities.

It is not possible to calculate the renewal rates of these canisters. The absorption rate of the carbon is well known, but the actual amount of gas with which the canister has been in contact is not known, and replacements must be by rule of thumb or time period methods.

If we presume that monthly changes of canisters were found to be necessary, a total quantity of 120,000 tons of activated carbon would have to be manufactured per annum, and this is an undertaking that calls for high technical skill and knowledge which could only be carried out by government organisation.

The quantity of rubber necessary to make the inside lining of the gas mask and the tube itself would be of the order of 10,000 tons for 45,000,000 gas masks, and that quantity of pure rubber could undoubtedly be secured.

It is absolutely necessary in any attempt to protect the population by means of gas masks to provide an efficient type, and not to leave the population subject to the advertising genius of irresponsible and unscientific manufacturers of makeshift apparatus.

It is an appalling thought that if gas mask protection is left to commercial enterprise money will be able to secure efficient protection, whilst those

without worldly wealth would be left to inferior equipment.

Any scheme of defence against gas will undoubtedly involve the production of a vast quantity of gas masks. In our opinion the Government should have the monopoly of such production so that profiteering in the supply of materials considered effective in certain circumstances of gas warfare should be eliminated.

CHAPTER 4.

THE AIRCRAFT INDUSTRY.

The aircraft industry is likely to present the most important aspect of the war preparations of the future. The *Manchester Guardian* editorial of May 24th, 1935, well describes it in the following:

"The aviation industry has now become an armaments trade and little else. Up to this year it was producing in England only a few hundred civil 'planes a year. Its main work has always been predominantly military. Most of the 234 machines and 409 engines it exported in 1933 (the last year for which we have a record) were destined for military service. Now, under our new programme, the military function becomes overwhelmingly the chief one. More new military aeroplanes (1,500) are actually to be produced this year than the whole of the civil fleet at present in existence—1,200 aeroplanes, a figure which includes sport and

pleasure craft of all ages and sizes. The manufacturing side of the air industry thus becomes little but an enormous war arsenal."

(*Manchester Guardian*, May 24, 1935.)

Like the other branches of the armament industry, the aircraft industry is closely allied with ordinary commercial enterprises. It has its connections with the motor car and small boat industries and depends for high grade materials on firms engaged in producing heavy armaments.

The development of the aeroplane is very dependent on the work of state research and experimental establishments and the direction of the Air Ministry with which the firms work in constant contact. Its work is mostly one on government contract to fairly full specification and under detailed regulations and supervision. It risks little of its own in experimental effort. The Ministry appears to follow a deliberate policy of keeping all its bigger and older units alive. This factor makes its position very different from that of ordinary competitive commercial enterprise.

The following is an account of how an aeroplane is constructed, the firms which manufacture them and what is the market at home and abroad for aeroplanes.

Aeroplane construction.

The aeroplane divides naturally into two parts, the power unit and the airframe. The relative cost of power unit and airframe depends upon the power/weight ratio of the aeroplane. On a rough average for military aircraft they are about equal.

The power unit.—The engine, the most important part of the power unit, has commonly been built by firms building motor cars, or closely associated with them. They are of two categories: the water-cooled, which is the type almost universally used in cars, and the air-cooled, the type generally used in motor cycles. In this country the water-cooled engine has been exclusively built by motor manufacturers—for example, Rolls Royce, now the sole survivor in the field—while the air-cooled has been built both by firms which make airframes (Bristol, Blackburn, de Havilland) and by motor car manufacturers (Armstrong Siddeley and Napier). The air-cooled is more quickly and cheaply produced, less vulnerable and better in maintenance, but the use of water-cooling has conduced to a faster aeroplane. Competition has so far led to no decisive conclusion, but the air-cooled is strongly in the ascendant now, and may in time give as high speed as the water-cooled.

The aero-engine assumes very different forms from those of the car engine; it requires more refined design to secure lightness; but the basic design and construction are the same as that of the motor car engine. Development of the one engine leads generally to the development of the other. The main difference in production lies in the much smaller demand, while in design close collaboration with aeroplane designers is desirable.

The power unit includes the airscrew, a specialised part made generally by airframe (aeroplane) constructors, or by specialised firms. It is built of hardwood (black African walnut or Honduras mahogany), of sheet steel (hollow blades), or of duralumin or magnesium alloy (solid blades). The light alloy blades have been growing in favour. The Fairey Aviation Co. specialises in this line (under patents of S. A. Reed, of U.S.A.).

The airframe.—The airframe consists of fuselage and undercarriage, wings and tail unit. The earlier construction employed light (soft) wood (best spruce) for members in flexure or compression, and piano wire and stranded steel cable for members in tension.

Swaged steel wires have replaced cable and piano wire, except for control cables, which, however, seem likely to go out of use; exposed wires are of lenticular section to reduce wind resistance. Metal has nearly replaced wood, in the form of very thin corrugated high tensile steel strip, riveted together to form, generally, a tube. Some aeroplane constructors have specialised in this steel strip construction and supply other constructors with components (e.g., Boulton and Paul). Rather expensive machinery is required

for rolling and rivetting the strip, but in mass production steel components are cheaper than wood; they are also lighter and metal aircraft have a longer life.

The covering (cowling) of the engine is beaten to shape by eye, an expensive process which would obviously be replaced by pressing by machine if production were large enough to warrant the capital outlay.

Radiators, tanks, piping and wheels are similar to the corresponding motor car components. The undercarriage has to serve the purpose of the corresponding parts of the motor car in riding over very rough ground and also to absorb the shock of impact on alighting. Simple springing has therefore been supplemented generally by a gun recoil type of mechanism, a product of the constructor of the aeroplane.

The structural design of the airframe has an affinity with structural engineering (e.g., bridges), which disappears in production. It has little connection with motor car chassis design, the scales of construction of aeroplane and car are, however, similar and the details of accommodation of occupants and installation of power unit are much the same. There is, in fact, a fairly close relationship between the production of the aeroplane and that of the motor car.

The sea (or water) plane introduces a connection with the speed boat. In place of wheeled chassis we have a hull (or pair of floats), which sustains the craft on the water, and by virtue of a stepped bottom causes it to plane over the surface above a certain speed and so travel fast with a relatively low expenditure of power until it can be air-borne. The construction of these parts is a specialised job, in which yacht and motor boat builders have played a big part (e.g., Saunders, of Cowes). Originally hulls and floats had wood frames and wood skins, but metal construction has now been successfully developed. These components are now built by aeroplane constructors who specialise in seaplanes (Short Bros., Blackburn Aircraft, Saunders-Roe, Supermarine). There is therefore a close relationship between aeroplanes, motor cars and motor boats.

Raw materials, components and accessories.

The raw materials of construction are high grade products. They include:—Carbon steels, containing carbon and manganese; alloy steels, and stainless steels, containing carbon, manganese, nickel and chromium; aluminium and magnesium alloys, containing copper, manganese and nickel, such as duralumin, Y, and R.R. alloys; bronzes, etc. High tensile steels are supplied in bar, in thin strip, in thin gauge tubes, of round and oval section, and swaged wires. Tinned sheet steel is required for tanks; brass tubes for radiators. Aluminium is supplied in sheets for covering; also for castings. There are about a hundred specifications for metals. Other materials are timber, spruce, mahogany, plywood; linen sheet and thread and tapes; dopes and varnishes and paints.

Components include wheels, tyres and brakes (incorporated in the wheels); steel tension members and fittings; radiators.

Accessories are:—Magnets, carburettors, accumulators, dynamos, lamps, flying instruments for the dashboard (e.g., air-speed, aneroid, revolutions indicator, compass). Among special accessories we find turn indicators, automatic pilots and other gyroscopic directing instruments, and radio equipment.

It will be seen that the industry is largely fed by the high grade steel and light alloy industries and that it also consumes linen. The use of linen and dopes seems likely to decline with increasing use of light alloy coverings. Its dependence on timber supplies has very much declined. It consumes cellulose products in dopes and paints, and rubber in tyres and tubing.

In the components and accessories there are many links with motor car production and connections with the scientific instrument industry and wireless industry.

Warlike accessories.

These consist of machine guns, bomb racks, gun-sights and bombing sights and are largely supplied by armament firms such as Vickers-Armstrongs, though there are other smaller firms which specialise in air armament, for example, Nash & Thompson, Ltd. (now incorporated in the Parnall Aircraft, Ltd.).

Research and technical development.

The aircraft industry is in a state of rapid technical development with a small output in relation to its experimental efforts. The Royal Air Force provides its principal market. The Air Estimates for 1933-34 show a total vote for "technical and warlike stores" of £7,203,000, of which 19 per cent. (£1,385,000) is for experimental work. The volume of production includes exports which in 1933 totalled £1,466,000. Including this, the ratio falls to 16 per cent., but part of the exports will be civil planes. The ratio of experimental to production work for civil aircraft will be lower but the total value is relatively small. It cannot therefore be far from the truth to say that the cost of progress lies between 15 and 20 per cent. of the total cost of progress and supply, or that experimental work costs about a fifth of the cost of production for service. This is of course partly due to aeroplanes being primarily armaments.

The experimental work is done about half and half (in cost) by the private industry and by public service. The industry builds all experimental aeroplanes and engines, mostly at public expense. This work is naturally less profitable than production orders. For the smaller classes of war planes it is usual to have competitive models built to a common specification by a number of contractors. The fortunes of firms swing to and fro with their success or failure in these competitions; the single-seater fighters at one time supplied by Armstrong Whitworth and Gloster are now supplied by Hawker; but aeroplanes are produced by other than the designing firms.

The industry has produced in the last ten years about 160 experimental aeroplanes, of which roughly one third have been adopted as pattern for equipment. The industry does little research. Six firms have small wind tunnels, but this number is likely to be increased in the near future. Short Bros. have a tank and Vickers (Aviation), Ltd. and Supermarine have access to the large Vickers tank at St. Albans. The industry's wind tunnels are much used to give guidance in design, but they are rather penuriously staffed and therefore liable to misuse.

The major aeronautical laboratory is the Royal Aircraft Establishment, covering almost every aspect of research into technical improvement; aerodynamics, engine, structural, material, instruments and radio. It has now five wind tunnels, one of which is large enough for full size tests; a tank for testing seaplane models; and a high altitude test chamber. The second laboratory is purely aerodynamic and is the section of the National Physical Laboratory. It has eight wind tunnels, of which one circulates air compressed to a high density which reproduces full scale phenomena with a reduced scale model. Some research is conducted with seaplanes at the testing station at Felixstowe.

The expenditure on the Royal Aircraft Establishment is of the order of half a million pounds a year, of which about one-third is classified as "research" and two-thirds as "technical development." It contains the Airworthiness Department, responsible for framing regulations and methods of computing strength and safety. At one time it largely duplicated the firms' calculations, but most firms, and all the Air Ministry contractors, are now "approved" and their calculations accepted. Contact between the Ministry Aircraft Establishment and industry is maintained by Resident Technical Officers.

The Royal Air Force has testing stations, with partly civilian staff, at Martlesham Heath and Felixstowe in Suffolk. Aeroplanes for the Air Force are

thoroughly tested and their performance carefully measured. Civil Aircraft pass some simpler tests for their airworthiness certificates.

Patents.

Attention must be drawn to the question of patents which, in a comparatively new industry, are important.

Patents are commonly taken out in the names of a specified person or persons (generally regarded as the real inventor/s) and the company for which he works. The company in these cases reaps the lion's share. Inventors in government service must inform and assign all rights to the department. They receive permission to take out a patent which is in fact taken out for them if the invention is of sufficient value to the Air Force. Where possible the Ministry grants permission for commercial and foreign exploitation to the inventor, reserving the right of user by Home and Dominion Governments, but 45 per cent. of the proceeds of sale or royalties must be paid to the Department.

Development.

The aeroplane was created by private enterprise. An experimental state factory was evolved by the War Office out of the Royal Engineers Factory, dealing at first with balloons and later with airships and finally with aeroplanes and engines. Its work was purely experimental up to the outbreak of the War. Twenty aeroplanes were sent overseas in August, 1914, and of those thirteen were the products of the factory. Further supplies were provided partly from the products of private firms, partly by putting the factory designs out to contract, and partly by the production at the Factory. The Factory attempted to fill the role of adviser and supervisor to private manufacturers, which aroused some resentment, although in general private designers have been ready to acknowledge a debt to its work.

After some two and a half years, design of aeroplanes and engines by the Royal Aircraft Factory was stopped and this change of policy has remained unaltered. The industry is certainly opposed to any competition by a state factory and probably feared the creation of a state monopoly of manufacture of military aircraft. The Royal Aircraft Establishment, as it is now called, has since played a large part in "scientific research and technical development." It has a relatively large design staff and industrial personnel and workshops but is not equipped with machinery for modern aeroplane production.

During the latter part of the War three National Aircraft Factories were set up at Croydon, Liverpool and Manchester, and were working early in 1918.

Aeroplane construction companies were founded by and bore the names of pioneers of experimental flying—A. V. Roe, T. O. M. Sopwith, C. R. Fairey, F. Handley Page and the brothers Eustace, Oswald and Horace Short. War pressure created a large industry. War planes and the technique of their use hardly existed in 1914 and were highly developed by 1918. Pre-war firms became large prosperous concerns and new firms were founded, while production overflowed into the motor car and furniture industries etc. The War left an excessive number of units for peace time production. Aircraft firms tried to carry on with other work. Some were wound up and reconstructed. The Sopwith Company became H. G. Hawker Engineering Co. (in memory of the late chief pilot of Sopwith's); the de Havilland Company struggled into existence out of the Aircraft Manufacturing Company, producers of "D.H." aeroplanes. There has been subsequent "rationalisation"; Vickers Ltd. has bought the Supermarine Aviation Works, Hawker Aircraft (1934) has bought the Gloster Aviation Co. and the Armstrong Siddeley Development Co. (controlling Armstrong Whitworth Aircraft) has bought A. V. Roe & Co., Sir A. V. Roe joining Saunders of Cowes. Some amount of technical co-ordination has accompanied financial changes.

Note on Airship Production.

The biggest production of airships has been that of the Zeppelin Company in Germany. The Goodyear Zeppelin Corporation of the U.S.A. was still building airships in 1933. Airships were built in this country by Vickers Ltd., Beardmore, and Armstrong Whitworth & Co. to the order of the Admiralty, but we have never had a distinct airship industry, except perhaps for the *short-lived Airship Guarantee Co.* 1925-1930), a subsidiary of Vickers Ltd. We abandoned airships in 1921, after the disaster to the R.33, to return in 1925 with the construction of two huge airships, one by contract with the above-mentioned *ad hoc* company and one in the Air Ministry's works at Cardington, Bedford. We again abandoned airships in 1930 after the R.101 disaster, but the Cardington works are kept under care and maintenance.

The Markets: Distribution of sales.

The Royal Air Force provides the principal market for the products of the industry. The vote for aeroplanes, seaplanes, engines and spares for 1934 was £5,955,000* and for the previous year £5,736,000. Statistics for the trade in civil aeroplanes are not available. The number of aeroplanes on the civil register now approaches half the number of planes in the Air Force, Reserve and Auxiliary Force; but very many civil planes are cheap light planes and the rate of replacement will be slower. The present rate of production of other-than-regular-transport civil planes is about 250 a year at an average price of £1,000.† Imperial Airways Ltd. had a fleet valued at some £650,000 (at cost) in 1933; in the same year its expenditure on aircraft was £146,000 and provision for obsolescence £172,000; in 1934 the figures were £31,000 and £191,000; in 1932 the amount spent on "additions to fleet" was £370,000.

The total home demand for civil aircraft at present is probably of the order of half a million pounds per annum. Statistics of the export trade are given at the end of this chapter. No distinction between military and civil supplies is available. The figures for 1933 are much the same as the average for the ten years 1924 to 1933. It will be seen that we have exported on the average 270 aeroplanes at an average price of £1,900 (with engines), 500 engines at an average price of £850, and £570,000 worth of spares, the total value of exports of aeroplanes, engines and spares, being about a million and a half. Most of this is presumably military supply to foreign and dominion governments; less than one-third is exported to the Dominions.‡ It will be noticed that there is a big demand for British engines for installation in foreign aircraft. To summarise, the 1934§ market may be divided into:—

	Million £
Royal Air Force	6
Export Trade	1.5
Home Civil	0.5
Total	8

Distribution of Trade among Firms.

The following table shows the contribution of each of eleven aircraft factories and four engine factories

* The full vote included £30,000 for experimental civil planes which has been subtracted.

† The Vote for aeroplanes, engines and spares for 1935 is £6,856,000.

‡ Small private aeroplanes cost £600 to £1,200.

§ Mr. H. J. Thomas, Chairman, Society of British Aircraft Constructors in *Air Manual of the British Empire*, 1934-35.

¶ Mr. Baldwin stated in the House of Commons on 28th November, 1934, that 25 new squadrons were to be added in 1935 and 1936 and that orders next year would be 50-80 per cent. higher.

to the present equipment of the Royal Air Force (1934) in number of squadrons equipped:—

Rolls-Royce, Ltd.	30	4
D. Napier & Son, Ltd.	9	10
Bristol Aeroplane Co., Ltd.	25	7
Armstrong Siddeley Motors, Ltd.	8	1

These figures refer to designs and not necessarily to production.

The Handley Page Co. devotes much of its efforts to exploiting the "Slot" patents, which have been largely developed by the Air Ministry. The right of user by the Air Force has been bought by the State.

The composition of the Force in respect to the design of its equipment varies in time. Some years ago there were squadrons of Gloster fighters and more Armstrong Whitworth aeroplanes. The present Westland equipment is obsolescent. The predominant position of Hawker Aircraft will be noted. This company has also supplied the Canadian, New Zealand, Danish, Norwegian, Swedish, Estonian, Yugoslavian, Greek, Persian and Japanese Governments.* The de Havilland Company is concentrated upon civil production, particularly light planes. It occasionally enters into competition for R.A.F. designs, but its policy is understood to be to hand production to another company. It has supplied the whole air force of Iraq, but the planes are civil planes adapted, and would be useless against a properly equipped force. This company captured the bulk of the light aeroplane trade some years ago.

Sir Samuel Hoare, introducing the Air Estimates in 1926, said: "The Aircraft industry is in a peculiarly difficult position through the fact that, unlike any other great industry in this or any other country, it is almost entirely dependent on the orders of a single government department . . . I have come to the conclusion that it is now safe and legitimate to withdraw many of the restrictions and, by this means, to enable British firms to sell their newer types in foreign markets a great deal sooner than they would be able to do without the withdrawal of the restrictions." From more recent remarks by Mr. T. O. M. Sopwith, it appears that foreign governments will only buy aircraft identical with those supplied to the British Government, and that the aircraft exported are always five years out of

(*) Prospectus of Hawker Aircraft, Ltd., May, 1933.

date in design. The trade is naturally almost confined to purchases by the smaller powers, and the

Air Ministry will not license exports of the most recent designs to its orders.

EXPORTS OF AEROPLANES, ENGINES AND SPARES.

Note.—(1) Aeroplanes are complete with engines. The above tables are taken from the Annual Report of the Director of Civil Aviation, 1933 (H.M.S.O.).

(2) Since 1931, owing to the devaluation of the £1 these are actually much cheaper than previously.

The year 1934 saw a very considerable increase in the traffic in aircraft and aero engines.

It may be assumed that the increasing crisis in international affairs of which the enormous expan-

sion programme of the National Government is a symptom, will also lead to a further increase in the export market.

PART V

The International Ring of Firms of Armament Finance and of Raw Materials.

The criticism made by the Union of Democratic Control of the international influence of the armaments industry has recently been indicated by a statement in *The Life and Letters of Lord Wester Wemyss, G.O.B., O.M.G., M.V.O.*, in which the following reference is made in a memorandum drawn up by Lord Wemyss and Mr. W. Harbutt Dawson:

"Apart from the moral objections to the present system, which makes warfare a direct occasion of private gain, the system is attended by the inevitable consequence that the multiplication of armaments is stimulated artificially. Every firm engaged in the production of armaments and munitions of any kind naturally wants the largest possible output. Not only therefore has it a direct interest in the inflation of the Navy and Army Estimates and in war scares, but it is equally to its interest to push its foreign business. For the more armaments are increased abroad, the more they must be increased at home. This interrelation between foreign and home trade in armaments is one of the most subtle and dangerous features of the present system of private production. The evil is intensified by the existence of international armament rings, the members of which notoriously play into each others' hands. So long as this subterranean conspiracy against peace is allowed to continue the possibility of any serious concerted reduction of armaments will be remote."

The armament firms at any rate thoroughly understand the value of internationalism. Attached to this memorandum are an extract from an Agreement between Messrs. Vickers Ltd. and Messrs. Vickers-Armstrong Ltd., relating to various foreign firms associated with them, and copies of official lists of shareholders in the Steel Manufacturers Nickel Syndicate Ltd. as on 21st October, 1914 and 21st March, 1935. It will be observed that Krupps were shareholders for at any rate two months of the Great War. The international character of this concern is obvious.

It is essential that the Commission should have access to all agreements and other documents relative to the international associations of British armament firms. The Union of Democratic Control suggests that the Commission should call for the agreements

contained in the following list as being representative documents:

IMPERIAL CHEMICAL INDUSTRIES.

- (1) Agreements with E.I. du Pont de Nemours on patents, processes and general interchange of information.
- (2) Agreement with E.I. du Pont de Nemours on sales arrangements.
- (3) Agreements with Solvay & Co. (Belgium) concerning chlorine and chemical interchange.
- (4) Agreements with I. G. Farbenindustrie concerning interchange of information, nitric acid.
- (5) Agreements with Belgian Explosives Group re ownership.
- (6) Agreements with Societe Française Dynamit.
- (7) Agreements with Cartoucherie Française.
- (8) Agreement with Hungarian Explosives Co.
- (9) Agreement with Norsk Sprengstoff (Norway) re interchange of chemical information.
- (10) Agreements with Roumanie Explosives Co.
- (11) Agreement with Union Espanola des Explosivos (Spanish) re interchange of information.
- (12) Agreement re sales with Comptoir Francais d'Azote (French).
- (13) Agreement with Coswig (German) re limitation of sales.
- (14) Agreement re sales with Montecatini (Italy).
- (15) Agreement with Czechoslovak Explosives Ltd. re investments.
- (16) Agreement with Barbier Group Explosives re abstention arrangement.
- (17) Agreement with Pouderies Reunies re sales.
- (18) Agreement with Societe Anon. de Dynamit de Matagne re sales.
- (19) Agreement with Societe Belge de la Dynamit Nobel re abstention arrangement.
- (20) Agreement with Casale Ammonia Co. re interchange of information.
- (21) Agreement with Etablissement Kuhlmann re abstention arrangements.
- (22) Agreement with Westfälisch Anhaltische Sprengstoff A. G. re sales.
- (23) Agreement with Poudrie Royale de Wetteren Coopall re sales.
- (24) Agreement with Norsk Sprængstoffindustrie Aktieselskat re abstention.

- (25) Agreement with Rheinisch Westfälische Sprengstoff *re* sales and exchange of technical information.
- (26) Agreement with Dervant & Huguenin *re* dye production.
- (27) Agreement with Remingtons (U.S.A.).
- (28) Agreement with Vickers *re* use of I.C.I. powder.
- (29) Agreement with United Alkali *re* oxidation of ammonia.
- (30) Agreement with Allied Chemicals (U.S.A.) *re* finance.
- (31) Agreement with Societa Italiana Recherche Industriale *re* abstention and markets arrangement for Casale ammonia.
- (32) Agreements with the British Government, e.g. with I.C.I. (Fertiliser and Synthetic Products) Ltd. and with the British Dyestuffs Corporation Ltd.
- (33) I.C.I. and Badische Co. (Germany).
- (34) I.C.I. and Jardine Engineering Co.
- (35) I.C.I. and Jardine Mathison Co.
- (36) I.C.I. and Mitsubishi.
- (37) I.C.I. and Royal Dutch Shell.
- (38) I.C.I. and Lurgi Corporation.

VICKERS LIMITED.

- (1) Agreement with Dynamit Aktien Gesellschaft with First Roumania Explosives Co. *re* part ownership of powder factory.
- (2) Agreement with Societe Central Dynamit (French) and Vickers-Terni (Italy) regarding sales.
- (3) Agreement with Remingtons.
- (4) Agreement with Colts *re* sales.
- (5) Agreements with Electric Boat Company regarding interchange of patents, sales agreements, sharing of profits.
- (6) Agreements with Schneider and Bofors regarding sales.
- (7) Agreement Vickers-Armstrongs with Copsa-Mica and Cugar (Roumania) to Skoda (Czechoslovakia).
- (8) Agreement with Maschiner Fabrik Augsburg-Nürnberg of Germany.
- (9) Agreements with Krupp.

NAPIERS LIMITED.

- (1) Agreement with Junkers *re* building the Junkers Juno oil-burning engines in England.

BRISTOL AEROPLANE CO.

- (1) Agreement with Dada-Dada Co. the representatives of Curtis-Wright Export Corporation in San Salvador.
- (2) Agreement with makers of Gnome and Rhône engines.

WAR OFFICE.

- (1) Agreements with Soley Armament Co. *re* sales of surplus stock, etc.
- (2) Agreement with B.S.A. Ltd. *re* sales of rifles, etc.

A study of such documents will establish the existence to-day of great international rings which do not cover only manufactured arms but raw materials and finance.

FOURTH SCHEDULE.

The benefit of all agreements and arrangements entered into by the Vendors for rendering technical services to others in connection with armaments, but subject to the obligations binding upon the Vendors

in respect thereof including agreements and arrangements with the following Companies:—

- (1) Sociedad Espanola de Construcción Naval.
- (2) Kabushiki Kwaisha Nihon Seikoshō (Japan Steel Works).
- (3) S.A. Acieres et Domaines de Resitz.
- (4) Vickers-Schneider.
- (5) Terni Company.

These documents prove, if any more proof were needed to-day, that the armament firms constitute an arms ring just as they did before the War. The international activities of the armament interests were enumerated in the report of the First Sub-Committee of the Temporary Mixed Commission, A.81/1921, and since that time such pamphlets as *The Secret International and Patriotism Ltd.*, both published by the Union of Democratic Control and, above all, the revelations of the U.S.A. Arms Inquiry, based on the documents and correspondence of the armament firms, have shown that such evils have in fact existed before and since the War. The British arms and munitions industry, by virtue of its predominant influence in the international arms ring, plays an important role in the evils associated with the industry. It is the considered opinion of the Union of Democratic Control that such evils are inherent in the system of private manufacture and trade, and its main concern has always been to show that the whole structure of the armaments industry must lead to such evils.

Arms Inquiry, based on the documents and correspondence of the armament firms, have shown that such evils have in fact existed before and since the War. The British arms and munitions industry, by virtue of its predominating influence in the international arms ring, plays an important role in the evils associated with the industry. It is the considered opinion of the Union of Democratic Control that such evils are inherent in the system of private manufacture and trade, and its main concern has always been to show that the whole structure of the armaments industry must lead to such evils.

PART VI

Government Servants and the Arms Industry

One of the most serious abuses of private manufacture arises from the association of government officials and the arms industry. This association of government servants with the armament firms, both because the government is the only home market and because licences are required for the export market, is inherent in the system.

The knowledge possessed by government officials is plainly of great use to the arms industry, and it is a well-known fact that officials in the fighting services and in other administrative departments not infrequently pass on retirement, or before, into the service of these firms.

The importance of this point is indicated in the fact that it was one of the four questions contained in the questionnaire concerning the private and state manufacture of arms and implements of war (Document Conf. D.A./C.L.5) which was sent by the President of the Disarmament Conference on October 28th, 1932, to the states invited to the Conference, with a view to obtaining certain information regarding the manufacture of arms in the different countries. The question and the British reply are as follows:—

Fourth Question: Are there any laws or administrative regulations in your country forbidding all soldiers or members of the military administration in active service to hold paid posts in private armament undertakings?

Reply: There are regulations in all the three fighting services governing the holding of paid posts in private undertakings by any active member of those forces. So far as the Admiralty and the War Office are concerned, there is no actual law or

regulation which in itself precludes an officer on the Active List on full pay from holding a post in a private undertaking, but, before any such post can be accepted, application must be made to the Board of Admiralty or the Army Council in accordance with paragraph 20, King's Regulations and Admiralty Instructions for the Navy, and paragraph 516, King's Regulations for the Army, and, in point of fact, permission would always be refused for an officer of either the Navy or the Army on full pay to accept employment in an armaments firm. As regards the Air Ministry, paragraph 1096 of King's Regulations for the Royal Air Force actually prohibits an officer or airman on the Active List on full pay from accepting any paid post in connection with any company, firm or individual engaged in trade.

Lord Snowden, in a speech on the Naval Estimates in 1914, referred to a paper called "*Armaments and Explosives*," devoted to the interest of the armament trade. In the issue of this paper in September, 1913, there was the following extract:—

"Contractors naturally are very keen to avail themselves of the services of prominent officers who have been associated with the work in which the contractors are interested. The first thing that they know the ropes, since the retired officer who keeps in touch with his old comrades is able to lessen some of these inconveniences, either by securing the ear of one who would not afford like favours to a civilian Kissing undoubtedly goes by favour, and some of these things that happen might be characterised as corruption. . . ."

The general atmosphere of collusion between the Government Departments and the arms manufacturers is accepted in an unquestioned manner by both sides. In a system of private manufacture there is no means of separating the interests of the country from private and commercial interests.

The list which follows has been compiled by the Union of Democratic Control and is necessarily incomplete. But it is sufficient to show how frequent a practice it is for ex-government servants to pass on retirement, either in the normal course or hastened for that purpose, into the private firms with which they, as government servants, have had previous dealing.

Vickers Ltd.

General the Hon. Sir Herbert Lawrence has been chairman of Vickers Ltd. since 1926. He was formerly the Chief of Staff, Headquarters, British Army in France, from January, 1918. After a distinguished military career in South Africa, in Egypt, in France and in the Dardanelles, he left the Army on retired pay in 1922.

Sir Mark Webster Jenkinson was the Controller of the Department of Factory Audit and Costs at the Ministry of Munitions, and Chief Liquidator of Contracts at the Ministry of Munitions after the War.

General Sir J. F. Noel Birch, after a long military career, was Artillery Adviser to the Commander-in-Chief in France from 1916-1919. He was the Director of Remounts, 1920-21, Director-General of the Territorial Army, 1921-23, Master-General of the Ordnance and Member of the Army Council, 1923-27.

Sir J. A. Cooper was the Principal in Charge of Raw Materials Finance at the War Office from 1917-19, and then became the Director of Raw Materials Finance at the Ministry of Munitions from 1919-21.

Sir Charles Craven is the Managing Director of the Works and Shipyards of Vickers-Armstrongs Ltd. etc. Served in Royal Navy, 1900 to 1912 (including command of several of the early submarines), retiring to join the staff of Vickers Ltd.; on the outbreak of war rejoined the Submarine Service; was released from active service in 1916 by the Admiralty at the request of Vickers Ltd. to rejoin their staff at Barrow to supervise the construction of Submarines and Airships.

The late Sir A. Trevor Dawson should be mentioned as one of the most important people who have been associated with Vickers. The late Sir Arthur Trevor Dawson, who was a director until the time of his death in May, 1931, was at one time Experimental Officer at Woolwich Arsenal, and was afterwards Superintendent of Ordnance to Vickers, and subsequently Chairman of their Artillery and Shipbuilding Management Board.

Sir Eustace D'Eyncourt was Director of Naval Construction and Chief Technical Adviser to the Admiralty, 1912-23. Has served with Fairfields, 1898-1902. After leaving the Admiralty in 1923 he was appointed Managing Director of Armstrong Whitworth's shipyards at Newcastle but was retained as Honorary Adviser on Naval Construction to the Admiralty. Well known for the design and construction of ships and tanks. He is now the consulting naval architect and engineer and adviser to Vickers-Armstrongs.

(Also see Parsons Marine Steam Turbine Co.)

Engineer Rear-Admiral R. Beeman recently appointed to Vickers-Armstrongs Barrow works. Lord Stanley in the House of Commons on May 29th, 1935, stated in reply to a question by Mr. Dobbie:

"Engineer Rear-Admiral R. Beeman was appointed deputy engineer-in-chief on 1st December, 1932. There is no fixed period for this appointment, which is at their Lordships' pleasure; its duration is usually about two years. This period having now expired, Engineer Rear-Admiral Beeman was due for relief during the course of the year, and would have retired in order to facilitate the promotion of junior officers. In view of his being offered the post of engineer manager at Messrs. Vickers-Armstrongs Barrow works,

arrangements were made for this relief to be carried out forthwith."

Col. Kenneth Edward Haynes was a special Director of Vickers-Armstrongs for some years till 1933. He was a member of the Ordnance Committee in 1918. Superintendent of Design in 1924-1925.

Technicians.

Mr. Hunn and Mr. Pain are two instances of technicians who have left government service to join Vickers, Ltd., and Mr. Symmons and Mr. Hammond, who have gone to Vickers Supermarine Aviation Co., Ltd.

Engineer Capt. S. C. Whyham, in September, 1934, was appointed gun mounting overseer at the Vickers Naval Construction Works, Barrow. Engineer Capt. Whyham was promoted in 1933 whilst serving in the Naval Ordnance Dept.

English Steel Corporation.—Rear-Admiral J. F. C. Patterson, O.B.E. Late Director Naval Ordnance.

Messrs. John Brown & Co. Ltd.

Joint Managing Directors:

Sir Thomas Bell, Deputy Controller of Dockyards and Shipping at the Admiralty, 1917-18.

Capt. T. E. Crease, Naval Assistant to the First Sea Lord, 1914-15. Private Secretary to First Sea Lord, 1917-19. Secretary of the Allied Naval Council, 1917-19.

Directors:

Sir Holherly Mensforth, Director-General of Factories, War Office, 1920-26.

Sir Chas. E. Ellis, sometime Director-General of Ordnance Supply and member of Council of Ministry of Munitions.

Sir Gerald Frank Talbot, Naval Attaché at Athens, 1917-20.

Trustee for Debenture Holders:

Admiral Sir Reginald H. S. Bacon, K.C.B., K.C.V.O., D.S.O. Director of Naval Ordnance and Torpedoes, 1907-9. Managing Director of Coventry Ordnance Works, 1910-15. Commanded Dover Patrols, 1915-18. Controller Munitions Inventions, 1918-19. Commanded Heavy Howitzer Bde., R.M.A., with B.E.F., France.

The Fairfield Shipping and Engineering Co.

Rear-Admiral Sir Douglas Brownrigg. Naval Censor during the War.

Messrs. J. S. White & Co. Ltd.

Chairman: Admiral Sir George Goodwin-Goodwin. Engineer-in-Chief of the Fleet, 1917-22.

Parsons Marine Steam Turbine Co.

Sir Eustace D'Eyncourt. Chief Technical Adviser to the Admiralty, 1912-23.

Birmingham Small Arms Co.

Chairman: Sir Alexander Roger, Director Motor Ambulance Dept., British Red Cross, 1914-15. Director-General of Trench Warfare Supply Dept., 1915-17.

Handley Page, Ltd.

Director: Wing-Commander Sir Louis Greig, Gentleman Usher in Ordinary to the King since 1924. Chairman, Not-Forgotten Association.

Armstrong-Siddeley Development Co.

Director: Air Marshal Sir John F. A. Higgins, Officer Commanding Forces in Iraq, 1924-26. Air Member for Supply and Research to the Air Council, 1926-30.

NOTE.—Sir John Higgins is also on the Board of A. V. Roe & Co., Sir Armstrong-Whitworth's Aircraft, Ltd., and Air Training, Ltd., which are controlled by the Armstrong Development Co.

Technicians: Messrs. Taylor, Reynolds, Briggs, Fell Wood, Foster, Draper and Lancaster are examples of technicians who have gone to Messrs. Armstrong-Siddeley. Mr. Green when he left the Royal Aeronautical Establishment was allowed to

take with him the drawings and all the information which was available on air-cooled engines. It was on the basis of his information that the whole of Armstrong's engine work has been built up.

Hadfields, Ltd.

Managing Director: Major Augustus B. H. Clerke, C.B.E., Assistant Inspector of Steel, 1899. Chief Instructor Ordnance College, 1906. Inspector, Royal Arsenal, 1908.

Babcock & Wilcox Ltd.

Director: Engineer Vice-Admiral Sir Robert Bland Dixon. Engineer Manager of Portsmouth Dockyards. Assistant Director of Dockyards. Engineer-in-Chief of the Fleet, 1922-23.

Rolls-Royce, Ltd.

Director: Major-General Sir William C. P. Boyce, K.C.M.G., Director of Transport, 1914-19. Technicians: Mr. Fell and Mr. Beilby.

D. Napier & Sons.

Chairman: Sir Harry Snagge, Director and Secretary of the Ministry of Information, 1918.

Directors: Vice-Air Marshal A. E. Borton, Sir Harry Brittain, K.B.E., C.M.G., Founder and Member of the Executive Committee of the Anti-Socialist Movement. Director of Intelligence of the National Service Department. Organised first series of visits of British women to the devastated areas 1919. Member of the Royal Air Force and Committee Ministry of Information. Also director of Illustrated London News and Sketch Ltd., and Provincial Newspapers Ltd.

General Aircraft Ltd.

Chairman: Sir Maurice Bonham-Carter. Air Ministry 1918. Brother of Lt.-General Charles Bonham-Carter, director of staff duties at the War Office, 1931-33. Director since 1933 of the Territorial Army.

Boulton Paul Aircraft Ltd.

Director: The Chairman is the Rt. Hon. Lord Gorell. Lord Gorell was Under-Secretary of State for Air, 1921-22. Recently he was Chairman of the Gorell Commission which recommended handing over greater responsibility for the safety of civil aircraft to contractors, a change which the industry had demanded for years.

Blackburn Aeroplane Co.

Technicians: Mr. Bumpus, Mr. Rennie, and Mr. Duncan.

Bristol Aeroplane Co.

Technicians: Messrs. Read, Vernon, Leach and Mansel.

Fairey Aviation Co.

Technicians: Messrs. Youngman, Forsyth and Jones.

Pornall, Aircraft, Ltd.

Director: Major L. V. S. Blacker was in the Directorate of Military Aeronautics and on the Imperial General Staff.

It was stated by the present Lord Chief Justice that it is not only necessary that justice should be done but that it should manifestly appear to be done. The Union of Democratic Control think that similar principles apply to this matter. When it is considered that the armament firms are dependent for business (either direct or by licensing) upon the British Government, it is surely most desirable that the employment of an ex-government official by an armament firm should be made impossible.

A large number of Acts of Parliament dealing with interested parties serving in Parliament, on Local Authorities, etc., have been passed to prevent any person being placed in a position in which his interest and his duty might conflict.

It is suggested that it is quite impossible to pretend that a government official is in that position if he is giving advice to the government on contracts with particular firms if he knows that at the end of his governmental service he may be offered employment by one of those firms.

It is not in the least necessary to suggest or to prove corruption. It is sufficient to say that in public life opportunities for corruption are as far as possible prevented from arising and on this ground the Union of Democratic Control suggests that if the Commission cannot recommend that the Armaments Industry should be taken out of private hands it should at least recommend that all government employees should as a matter of policy undertake never to take employment with any firm which has had government contracts or should forthwith resign his appointment upon any such contract being entered into.

This rule might well be general but in the case of the Armaments Trade having regard to the facts given in this part of the case and to the nature of that trade, there appears to be no answer to such a suggestion.

The correspondence and parliamentary questions relating thereto which follow show a slightly different aspect of the same question. It indicates the manner in which private firms may use their contacts with the services to obtain salesmen or other officials.

LETTER 1.

3, Lombard Street,

London, E.C.3.

24th June, 1931.

Colonel E. J. Skinner, D.S.O.,
Headquarters, Royal Artillery,
Northern Command,
York.

Sir,

We have the honour to inform you that our China friends, The Jardine Engineering Corporation Limited, are desirous of enlisting the services of an Officer of the Royal Artillery for employment on their Staff in China. The work which this gentleman would have to do would be to sell all natures of arms, ammunition, etc., to the Chinese Government.

It will be within your knowledge that several Continental Armament firms have been doing considerable trade in arms with the Chinese, especially during the period during which British Firms were prohibited from so doing by the terms of the Arms Traffic Convention. Now this embargo has been raised, they are anxious to develop this side of their activities in China.

In our opinion the Officer selected should be about 30 years of age and should if possible have active service experience or at any rate a good general knowledge of all natures of armament, e.g., machine guns, tanks, aircraft, etc.

We should be extremely obliged if you could see your way to making enquiries among the officers under your command as to whether any of them would wish their names put forward for this employment.

The conditions would be a guarantee of three years at a salary of £500 per annum, subject to an extension to five years at the Jardine Engineering Corporation's discretion, in addition of course to full travelling expenses. While it is not possible of course for us to give any guarantee at this juncture of employment after the conclusion of the first contract, there seems to be no reason at all why an introduction to commercial life in China should not present a very attractive opening for an officer who is prepared to spend long periods in the Far East. For this reason it seems desirable that the Officer should be unmarried.

In conclusion we would say that the appointment of this gentleman is of a very urgent nature, and we would, therefore, request you to be good enough to reply as soon as possible.

We have the honour to be,

Your obedient Servants,

(Signed) L. O'KEEFE, Director.
MATHESON & Co., LTD.

LETTER 2.

Headquarters, R.A.,
Northern Command,
York.
26th June, 1931.

DEAR COLONEL,

Colonel Skinner has asked me to send you the enclosed letter as he would very much like to have the views of the Inspector of Artillery on it, and his advice as to what action if any he should take. Would you very kindly return the letter with your reply.

Yours,

(Signed) R. A. ARMSTRONG, Major.

Bt. Lt.-Col. N. M. de la P. Beresford-Peirse, D.S.O.,
The War Office, S.W.1.

LETTER 3.

M.T.1,
The War Office,
London, S.W.1.
30th June, 1931.

DEAR ARMSTRONG,

Yours of the 26th June. Enclosure returned.

The Inspector of R.A. is of the opinion that there is no objection to Colonel Skinner letting any suitable officer he knows of, be aware of the opportunity of the appointment. Personally he feels that the opportunity, for a serving officer, in view of the precarious condition of the armament outlook, is not attractive.

The Inspector of R.A. feels that, apart from the age qualification, the job is ideally suited for Colonel P. Suther, late R.A., and that Colonel Skinner might well mention him when replying to Messrs. Matheson & Co., Ltd.

Colonel P. Suther, as Colonel Skinner knows, has just the knowledge they want, and is looking for a job.

Yours sincerely,

(Signed) N. BERESFORD PEIRSE.

Staff Officer R.A.,
Headquarters,
Northern Command.

LETTER 4.

Headquarters R.A.,
Northern Command,
York.
3rd July, 1931.

GENTLEMEN,

I have been asked by Colonel Skinner to write to you about your letter of the 24th June with reference to enlisting the services of an officer of the Royal Artillery for employment on the staff of the Jardine Engineering Corporation, Ltd., in China.

Colonel Skinner has passed your letter on to Colonel P. Suther, C.M.G., D.S.O., who, although over the age of 30 years, is very active, and considered to be the most suitable for the appointment.

Yours faithfully,

(Signed) R. A. ARMSTRONG,
Major, R.A.

To Matheson & Co., Ltd.,
3, Lombard Street, E.C.3.

On 6th December, 1934, Mr. Seymour Cocks asked the Financial Secretary to the War Office whether he is aware that the firm of Matheson and Company, Ltd., on behalf of the Jardine Engineering Corporation Ltd., the agents for Vickers Armstrongs Ltd. in China, consulted the headquarters of the Royal Artillery (Northern Command) York, as to an officer

who could be an arms salesman; that the commander in charge of the headquarters consulted the War Office; whether the War Office made any suggestion as to a suitable officer; whether this suggestion was adopted and whether it is the policy of the War Office to assist the arms firms in the appointment of their salesmen?

Mr. Hacking replied: "I have no knowledge of any official correspondence on the subject; but in any case, if the War Office were asked to recommend a suitable retired officer for a civilian post, I should see no objection to this being done."

Mr. Cocks asked: "Is not the right hon. Member aware that the War Office say, in their letter of 30th June, 1931, that they have no objection to serving officers being recommended for this purpose?"

Mr. Hacking replied: "That is exactly what I cannot trace. We have no official information with regard to that."

Mr. Cocks asked: "What has happened to the files of the War Office? Have they been destroyed so that the relationship between the armament firms and the War Office cannot be disclosed?"

On 11th December, 1934, this was followed up by another question:

11 Decr., col. 203.

Armament Firms (Appointments).

In reply to a question by Mr. Cocks concerning correspondence of 20th, 26th and 30th June, 1931, relating to the appointment of an arms salesman, Mr. Hacking said: "I have now had the advantage of seeing in the Press copies of the letters to which the hon. Member refers, and of getting into touch with the officers who wrote them. Now that I have seen them, it is quite obvious that they were written as personal, not as official, letters, and that is the reason why they were not filed at the War Office. The writer of the letter of 30th June, 1931, evidently did allude to serving officers, but it is neither the policy nor the practice of the Department to recommend serving officers for civil posts of this nature."

Mr. Anstruther-Gray asked whether these letters were written during the Labour Government's administration. Mr. Hacking replied: "Yes, Sir, that is so; and, consequently, if the hon. Member still thinks that this correspondence was of an official character and desires to attach any blame, the blame must be put on someone else and not on us."

The matter, however, did not rest there. The King's Regulations for the Army and Army Reserve, 1928, Section 7, Discipline, Paragraph 512 (a), read:

"An officer is forbidden to write private letters to officials at the War Office on official personal matters such as promotion, appointment, posting, transfer, &c."

Therefore, on 28th January, 1935, Mr. Seymour Cocks asked the Financial Secretary to the War Office: "What action he proposes to take in the matter of the correspondence relating to an arms salesman for the firm of Matheson and Company, Ltd., on behalf of the Jardine Engineering Corporation, Ltd., the agents for Vickers-Armstrongs, Ltd., in China, and stated to be personal letters, in view of King's Regulations, 1928, Section 7, Discipline, paragraph 512, which forbids an officer to write private letters to officials at the War Office on official personal matters such as promotion, appointment, posting, transfer, etc.?"

Mr. Hacking replied:

"No action is proposed. The Regulation to which the hon. Member refers does not, and does not intend to, forbid an officer from making personal inquiries at the War Office as to whether the name of any officer can be suggested who is suitable for a post outside the Army."

This association of arms firms with government servants is inherent in the system of private manufacture and is plainly open to the gravest abuses. The American Arms Inquiry in such revelations as those concerning Sir Charles Craven has shown that

such abuses do in fact occur. The case of Sir George Sidney Clive and others might be cited in this country. The existence of such regulations as those contained in paragraph 56 of the Report of the Board of Inquiry into certain statements affecting Civil Servants (February, 1928) indicates that these abuses are possible.

Further, the system of private manufacture leads to the possibilities of improper relations between armament firms and their agents with foreign governments, through diplomats, consular agents, and other channels. The *Times* correspondents and the case of Mr. A. V. Lander might be mentioned and a short statement dealing with the former follows.

This inter-relatedness extends even to the region of international conferences such as disarmament conferences at which nominees of the private firms have been present as delegates, whilst the American Arms Inquiry has shown how the private firms have their own international conferences, and then use their influence with delegates to ensure that their interests are not affected by any measure of disarmament.

No reform of the present system of private manufacture can remove the possibilities of these and other abuses which in fact have occurred. Only by taking the industry out of private hands can the association of government and war contractors be ended and with it the temptations to such abuses.

STATEMENT CONCERNING *Times* CORRESPONDENTS WHO HAVE ACTED SIMULTANEOUSLY AS VICKERS AGENTS.

At the Annual Meeting of Vickers Ltd. Mr. Kidd made certain statements concerning the correspondents of the *Times* who had acted simultaneously as Vickers Agents.

The Chairman, Sir Herbert Lawrence, in replying said:—

"I would ask the gentleman who was speaking just now to remember that I am perfectly willing to answer any questions on matters of this kind if he will come and meet me. He has asked a whole series of questions, and all I can say is, I have never heard of these gentlemen. I can assure you there is nothing to conceal. You shall have all the information we have got."

The following are the correspondents who were mentioned:—

Roland L'Esrange Bryce, 60 B, The Ridgeway, S.W. 19.

Mr. Bryce, a nephew of Lord Bryce, went to Belgrade in 1921 as a British Diplomat in the Legation. In 1923, although he had had no journalistic experience, he became the *Times* correspondent and Agent for Vickers. We know for certain that his chief business was to induce the Yugo-Slav Government to buy submarines (at the time when the British Government was supposedly in favour of the abolition of submarines). He was also supposed to sell agricultural machinery, though this was a subsidiary object as is shown by the fact that his illustrated catalogues were in English and not even priced.

Mr. Bryce did not know Serbian. He had had no journalistic experience. His journalistic work was done for him by the daughter of a White Russian General, the lady being, at the same time, the employee of the official Yugo-Slav Press Bureau.

Since it was essential not to offend the Government of Yugo-Slavia, Bryce himself did not include in his despatches anything disadvantageous to it. His "ghost," the White Russian lady, co-operated willingly because she on her side wished too to preserve the existing reactionary Pashitch regime, and prevent Yugo-Slavia recognising the Soviets. A study of the *Times* files for the years in question (1923-1924) substantiates this point.

Mr. Bryce was not successful as an agent for Vickers and when they dismissed him he lost the *Times* post as well.

M. Georges Boncesco, Financial Councillor to the Roumanian Legation, Washington, U.S.A.

M. Georges Boncesco was formerly Commercial Attaché to the Roumanian Legation in London. From January, 1920, to June, 1927, he acted as *Times* correspondent, though he too had had no previous journalistic experience. He, too, was careful to avoid any despatches which might compromise his other post, that of Vickers' Agent. It was remarked at one time, unofficially, but in writing by an important member of the staff of the *Times*, that "Boncesco sends the official declaration of Roumanian politicians, which, you will admit, are far from being the proper contributions for the *Times*."

M. Boncesco, at the same time, was acting as Assistant to Dr. E. Madge, who was representing Vickers in Roumania. M. Boncesco looked after the commercial part, whilst Dr. Madge provided the necessary political influence. They were both living in the house of the painter Nicolas Patragou, on the Boulevard Lascar Catargiu. Owing to the intervention of Queen Marie's favourite, Prince Stirbey, through whom negotiations at the Ministry of War had to be made, Boncesco lost his Vickers' agency. He was replaced in 1924 by Mr. Boxshall, the son-in-law of Prince Stirbey, who became afterwards the Chairman of the Board of Directors of Resitz, an armament firm in which the State holds the control and Vickers 20 per cent. of the capital.

M. Mavrocordato.

M. Mavrocordato, a clerk in Mr. Boxshall's office (i.e. the Roumanian office of Vickers), followed M. Boncesco. M. Mavrocordato's official address in the official Roumanian Press Bureau was given as Vickers' Office. He, too, had had no previous journalistic experience. He was a young engineer, who had studied at Cambridge. When the *Times* correspondents were reorganised Mr. Lumby became a special correspondent for S.E. Europe. M. Mavrocordato was his assistant for Roumania, and he is still assistant correspondent of the *Times*.

The above statement is an instance of abuses of the present system which make it desirable that that system should end. Others could be cited but it is not the concern of the Union of Democratic Control to pursue any particular case beyond using it as an illustration.*

The Union of Democratic Control, however, wishes to point out that the British Government has never declared that they recognise the evils of the Private Manufacture of and Trade in Arms. The Prime Minister's Draft Convention of 16th March, 1933, still the outstanding document before the dormant Disarmament Conference, made no reference to it, and the British Delegation gave no support to the modified French proposals for a system of rigid international control of manufacture, which the French put forward as a compromise in May, 1933.

It is hoped, therefore, that the Royal Commission, faced with the evidence which has been laid before it, will place on record an official recognition that charges enumerated in 1921 by the Temporary Mixed Commission are an accurate description to-day.

* The following are some of the more important Exhibits in the U.S.A. Inquiry which have a special bearing on British firms and the abuses associated with them:

Relations of Vickers Ltd. with the Admiralty:	Part I. Exhibits 18, 19, 20, 21, 22, 23, 32, 125, 126, 127.
Ex-officials and Vickers Ltd.	Part I. Exhibits 127, 172, 173.
Relations with the Press.	Part XI. Exhibits 926 and 927.
Military information sent Abroad.	{ Part XI. Exhibit 948. Part II. Exhibits 213, 255, 256.
Influencing Disarmament Conference.	{ Part IX. Exhibits 816, 817, 818, 822, 824, 827. Part XI. Exhibit 931.
British Consulates' assistance to Arms salesmen.	{ Part III. Page 644. Part X. Exhibit 879. Part XI. Exhibit 948.
Armament Loans....	{ Part I. Exhibit 162. Part V. Exhibit 463, 464, 476, 512.
Avoiding Treaty obligations.	

PART VII

Present Arrangements in force in the United Kingdom relative to the control of the Export Trade in Arms and Munitions of War.

The Terms of Reference of the Royal Commission state, with regard to licensing, that the object is:—

"To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what direction."

The system at present in force is to require a licence for every consignment of arms exported. It must be pointed out that for the most deadly weapon of warfare—the aeroplane—there is an open general licence, issued for their export, the only exception being Abyssinia. This arrangement was based on a desire to foster the aeroplane industry, even at the expense of the public interest both at home and in those many countries which import British aircraft.

In presenting the estimates in the House of Commons, in 1926, Sir Samuel Hoare, then Minister of Air, explained the situation in suitable terms. He said:—

"Obviously the aircraft industry is essential to the expansion of the Force in any time of emergency. It is no good denying the fact that the aircraft industry has many difficult problems to face. It is in a peculiarly difficult position through the fact that, unlike any other great industry in this or any other country, it is almost entirely dependent on the order of a single Government Department. In the case of other great industries, there are private customers who give orders, and the industry is not entirely dependent on one Government Department. This means that in the case of the aircraft industry a change in Government policy reacts with particular force upon the industry because it has no other customer. . . .

"I have been considering the position with my advisers, and have come to the conclusion that it is now safe and legitimate to withdraw many of these restrictions and, by this means, to enable British firms to sell their newer types in foreign markets a great deal sooner than they would be able to do without the withdrawal of the restrictions. I hope, as a result, it will be possible for the British firms to be less exclusively dependent on a single Government Department here, and that it will help them to build up for themselves markets abroad for British machines and British engines—than which there are no better anywhere in the world."

This open general licence reveals an extraordinary gap in the British licensing system, and if aeroplanes are to be exported at all, they should come under a system of licensing. Further, in view of the convertibility of civil planes for military purposes, a similar licence should be imposed for civil aircraft.

With regard to all other licences, it is surely an axiom of an effective licensing system that all the statistics of export should be promptly and fully published. At the present time, they are not published except in reply to questions in the House of Commons, which extract only incomplete information. Statistics showing the amount of goods exported and the countries of export are given in the three-monthly Board of Trade statistics, but this information is available only after the arms have left British ports.

The inadequacy of the information possessed by the British Government is admirably shown by the following incident.

In 1928 a special commission set up by the League of Nations Assembly to draft a Convention for the Supervision of the Private Manufacture and Publicity of the Manufacture of Arms and Ammunition and Implements of War, recommended that each government "should undertake to transmit to the Secretary-General of the League, or to publish within two months after the close of each quarter,"

certain information about the armament licences granted. This information included "the names of all the enterprises with which the holder (of the licence) has concluded agreements or associations of any kind whatsoever, with a view to the production of the articles of war material for which the licence has been granted" (Clause 2). One objection raised was that the countries dependent on imports of armaments from abroad would be unable to keep private the nature of their war preparations while their manufacturing neighbours would enjoy all the advantages of secrecy. The British delegate gave several very illuminating reasons for refusing to accept this clause:—

"In the first place my Government could not give this information; they have not got it. Secondly, it is only the manufacturers—the licensees themselves—who could furnish it, and they would certainly refuse to do so. Thirdly, we have no power to compel them to do so, and, fourthly, very few Governments would have the courage to introduce legislation to make them do so."

The British Government was undoubtedly right in suggesting that very few governments would have the courage to introduce legislation to force armament manufacturers to divulge information about their work. Such secrecy is inherent in the private manufacture of arms.

Another example of the incompleteness of the present licensing system is indicated by the fact that the names of the firms are never divulged. Sir J. Simon, on 7th December, 1931, stated with regard to export to China and Japan:—

"I should not in any event be prepared to divulge the names of the applicants for licences, which are always treated as confidential." Two days later, 9th December, 1931, Major Colville stated, concerning China and Japan:—

"During the past two years licences to export war material to the Governments of both countries have been issued. The licences were in respect of machine guns, rifles, anti-aircraft guns, ammunition, TNT, cordite, neonite, tanks armoured vehicles, aircraft armament, fire control gear, naval shells and submarine mines. As I have already stated, I am not prepared to disclose the names of the firms to whom the licences were issued."

Mr. Thorne said: "Will the hon. Gentleman give any reason why he is not prepared to give the names of the firms in question?"

Major Colville replied: "The policy has been carried out by successive Governments, and I see no reason to depart from it."

Again on 7th June, 1932, Mr. Runciman stated in reply to a question concerning the refusal of permits:—

"It has never been the custom to give these particulars, and its undesirable to do so." Lastly, on 10th December, 1934, when Mr. R. T. Evans asked the following question:

Mr. R. T. Evans asked the President of the Board of Trade particulars of all licences granted during the years 1932, 1933, and the 11 months of 1934, in respect of exports of war material, such particulars to include the names of the firms to whom the licences have been granted, the quantities and descriptions of the commodities involved, and the overseas countries to which they were consigned?

Colonel Colville replied:

"It has not been the practice to disclose the names of the individual firms to whom licences have been granted, and the value of a statement of such length and in such detail as the hon. Member desires would not in my opinion, justify the expenditure of the time and labour which would be required for its preparation."

Occasionally licences are refused, but incomplete information only is available on such refusals.

On 27th February, 1934, Mr. Runciman admitted:

"Records of the number of licences issued are not available for the whole period in question. In any event, statistics showing only the number of licences issued would give no indication of the quantities or materials covered by such licences, and to extract the information as to quantities and materials over the period for which records are available would require expenditure of much time and labour."

On 24th April, 1934, Mr. Runciman stated:

"Seven formal applications for licences to export arms were refused during the four years 1930 to 1933. I should, however, add that in cases of doubt prospective applicants normally make informal inquiries, and that no information is available as to the number of cases in which inquirers were informed that a licence would not be issued." These seven cases were described on 9th May, 1934, in the following statement by Sir John Simon:

"The consignees in the seven cases referred to were Government authorities in China (three cases) and in Brazil (two cases), a private individual in Austria, and a firm in Belgium. Various Departments are consulted before the issue of licences, and the decision to refuse a particular licence may be taken on the advice of any of these Departments."

On 27th November, 1934, Mr. Runciman gave later information:—

"In the 12 months ended 31st October, 415 licences were issued for the export of war material and seven licences refused."

Sir John Simon gave confirmatory statement of the general principles governing the licensing system on 8th November, 1934:—

"In the first place the British exporter has to establish to the satisfaction of the appropriate Department the real destination of his goods. Again, we give no licence except for export to Governments, a thing which is worth noting. In the next place, we refuse the benefit of our export credits system to the export of munitions of war, and, so far as I know, we are the only country in the world which does so. Further, we never subsidise a private firm to produce arms—never. If I may refer to the service of the Foreign Office and make a perfectly simple statement about it, we never allow our diplomatic or consular representatives abroad to act as travellers or canvassers for armament firms—never. Our diplomatic help is given only when a foreign State has announced its intentions to purchase from abroad. Then our service naturally does its best to secure that the British firms should get a proper opportunity."

Assuming the private manufacture of and trade in arms, it is not enough to have prompt publication of detailed statistics for trade from the licensing of the order at the works to the final consignment to the receiving Government. There should be a licence system which includes manufacture, both State and private, and this must be accompanied by an international organisation for the inspection of the industry on the spot in order to verify the returns which are made.

A system which demanded a licence for the manufacture, with full publicity and inspection would expose the accelerated arming of countries which invariably precedes a war. Thus, for example, the arming of Bolivia and Paraguay from 1928 onwards, when the dispute between Bolivia and Paraguay broke out, would have been known to the world before continuous warfare started in 1932. Similarly, the concentrated arming of China and Japan from 1929 onwards would have been exposed. It was little short of a farce to discuss an embargo, in the case of Bolivia and Paraguay in 1933, when the two countries were already fully equipped, and in the case of China and Japan when both countries were supplied.

The case of the Chaco is particularly notorious, as neither Bolivia nor Paraguay manufactured arms, aircraft or munitions. The war was therefore only possible because of the activities of arms manufacturers from the very countries which were

supposed to be trying to stop the war. The prolonged delays in establishing an arms boycott and the leakages which continued afterwards across the Argentine and through the international rivers in South America, emphasise the need for a far more stringent licensing system, which is only possible if based on a state ownership and control of arms manufacture.

The licensing system is further incomplete as it does not include the export of chemical substances which are of military use only, and certain elements required for the manufacture of explosives.

But even these improvements in the British system do not remove the dangers inherent in the arms traffic. Nor do they remove the possibilities of British firms circumventing them. They do not prevent British firms manufacturing or finishing arms abroad and thus avoiding the licence system. This manufacture abroad can take two forms:—

(1) it can be done in direct subsidiaries of the home armaments firms, and

(2) it can be done under licence in the works of foreign armament firms.

Examples of direct foreign subsidiaries are:—

Vickers.

Placencia del las armas, in Spain.

I.C.I.

Bickford & Co., Austria (fuse factory).

Cartoucheria Obea, Argentine (revolver and sporting ammunition).

Fairey Aviation.

Belgian factory.

Soley Armament Corporation.

Belgian factory.

This is plainly shown in answer to a question in the House of Commons on 7th June, 1932:—

Mr. Tom Williams asked: "Do I understand from the reply that where English people have firms abroad producing munitions of war they are subject to these licences?"

Mr. Runciman replied: "No, Sir; licences can only apply to exports from this country."

Both Vickers and I.C.I., as well as having these direct subsidiaries abroad, also have large investments ranging from 50 to 20 per cent. in foreign armaments firms. Vickers has interests in Vickers-Terni, Italy; the Japanese Steel Works, which is part of the Mitsui armament concern; Resitza, Roumania; the Societe Polonaise de Materiel de Guerre and the Sociedad Espanola de Construcion Naval. I.C.I. has interests in Societe Anonyme d'Arendonck explosives factory in Belgium (30 per cent.); Czechoslovak Explosives, Ltd., (32 per cent.); Dynamit-Action-Gesellschaft (12 per cent.) Explosives and Accessories, Germany; the Roumanian Explosives Co. (20 per cent.); the Hungarian Explosives Co. (12 per cent.). Vickers and I.C.I. have also a number of subsidiary and allied companies in the British Dominions.

Secondly, the records in Somerset House and the Agreements produced in the American Inquiry show that Vickers and I.C.I. have a number of patent and selling arrangements with foreign armament firms. These probably include, as did the agreement between Vickers and the Electric Boat Company, arrangements for carrying out work in each other's factories.

Further, the licensing system does not cover, nor indeed affect, the preliminaries to the placing of orders. Colonel Colville admitted as much in a statement on 8th March, 1933, when he said:—

"There is no regulation which requires arms manufacturers and merchants to advise my Department immediately a foreign contract has been secured. The jurisdiction of the Board of Trade commences only when application is made for an export licence."

Another criticism of the present licensing system is that based on the fact that embargoes can and are in fact avoided in spite of it.

For example, an arms firm can sell to a third party, which can re-sell to the nations requiring arms. This happened in the case of Bolivia and Paraguay, although the British Government denied any knowledge of it. For instance, on 13th February, 1935, when asked whether he was able to state what arms reached Bolivia and Paraguay during the period of the double embargo, Sir J. Simon said:—

"No, Sir. I regret that I have not sufficient information to reply to this question."

Mr. Mander asked: "Will my right hon. Friend consider the advisability of asking for the information to see whether there are any arms in addition to those from Belgium and Norway about which representations have already been made?"

Sir J. Simon replied: "These were cases in which information reached us, not from Bolivia or Paraguay, but from other sources. My hon. Friend will, of course, see the difficulty of knowing where to address our enquiries."

Documents in the U.S.A. Arms Inquiry brought to light a number of such cases, concerning China and Japan, and Bolivia and Paraguay.

Example 1.

On 12th September, 1929, Colonel Taylor, the joint agent of I.C.I. and du Pont de Nemours in Paris, cabled to the American firm:—

Cable No. 792.

"Believe N. E. Bates Jr. should try to sell to Northern China as I do not believe we should deal through Holland. Imperial Chemical Industries Ltd. have quoted following prices to Shanghai through Austrian company. Cannon powder 2.65 dollars; rifle powder 2.26 dollars per pound c.i.f. including 25 per cent. commission."

Cabled from Paris Office, 12th September, 1929.

Example 2.

The following Exhibit No. 477 was written by Mr. N. E. Bates, Jr., the South American Agent of du Pont and also of I.C.I.—

Exhibit No. 477.

(Copy to Imperial Chemical Industries, Ltd., Sec. Anon. Commercial e Industrial Tucuman, 681, Buenos Aires, Argentina, and Imperial Chemical Industries, Ltd., 285, Madison Avenue, New York.)

Imperial Chemical Industries, Ltd.,
Cordite Section,

Millbank, London, S.W.1, England.

DEAR SIRS,

Attached is confirmation copy of our cablegram of 7th June informing you that Sr. Manuel Ferreira, our agent in Paraguay, who is now in Buenos Aires, asked us for prices c.i.f. Montevideo on 200 kilos. Picric Acid and 2,000 kilos. Flake T.N.T. We also informed you in our cablegram that we could not quote from this end owing to the embargo on munitions and military propellants decreed by President Roosevelt.

In view of the fact that there is no similar embargo obtaining in England, we suggested that you quote prices to your office in Buenos Aires, who in turn would advise Ferreira.

Although this inquiry distinctly states that prices are wanted c.i.f. Montevideo, we suspect that the material is for Paraguay, and since we wish to co-operate with our Government in observing the embargo, we deemed it best not to quote.

Yours faithfully,

For E. I. DU PONT DE NEMOURS & COMPANY,

N. E. BATES, JR.

NEB:AKR.

Exhibit No. 478 gives the telegram and its decoding:—

Manmu	Stop
ICI	I.C.I.
Gjexe	London
Ixcje	Will quote
Dsoox	Direct to you

Further, embargoes are always discussed for months beforehand so that not only the countries at war but the arms firms are given abundance of notice. In a letter from Mr. J. H. Spencer, of Spencer & Waters, Ltd., Chile office, dated 24th December, 1932, Mr. Spencer, writing to Mr. Monaghan, the Export Manager of Remington Arms Company, said:—

"I notice in the Press that there is considerable agitation in Washington circles to put an embargo on shipments of any ammunition to any of these countries practically at war, but in the meantime European manufacturers are selling all they possibly can."

Conclusion.

To summarise our criticism of the present system of licensing:—

- (1) It does not cover the export of aeroplanes.
- (2) It does not cover the export of chemical substances which are of military use only and certain elements required for the manufacture of explosives.
- (3) Information is only published after the arms have left British ports.
- (4) Information is inadequate. It does not give the name of the firms involved. It does not give particulars of cases where permits for licences are refused. It does not cover manufacture nor the essential inspection which should accompany manufacture.
- (5) It does not prevent British firms manufacturing or finishing arms abroad and thus avoiding the licensing system.
- (6) It does not cover the preliminary unofficial inquiries made by prospective applicants.

Assuming the trade in arms, the following are essential reforms, but it must be stated that only the prohibition of the export of arms and munitions would remove the abuses inherent in such traffic:—

- (1) Publication of licences.
- (2) Publicity for orders from state and private works.
- (3) Publicity for purchase by home and foreign governments.
- (4) Licences to manufacture and full publicity for such manufacture.

The suggestions for such proposals made during February, 1935, were supported by all nations except Great Britain, Italy and Japan.

The Union of Democratic Control therefore hope that, as a contribution to the removal of the present serious defects of the licensing system the Royal Commission will advise the British Government to support the aforementioned proposals.

PART VIII

The Practicability of the Prohibition of the Private Manufacture and Trade and the Institution of a State Monopoly.

In preparing the three sections which follow the Union of Democratic Control urge that quite apart from particular instances of inefficiency the system of private manufacture of arms inevitably gives rise to inefficiency. No suggestion for reforming these abuses can abolish these inherent tendencies. If they are to be avoided, the whole industry must be taken out of private hands.

It is not the function of the Union of Democratic Controls to make detailed proposals for producing an efficient war machine or to advocate nationalisation for that purpose. The Union of Democratic Controls' objects do not include this object. It is the business of the Union of Democratic Control to demonstrate the widespread and inherent evils in the armament industry. The present system has been shown to give rise inevitably to inefficiency, corruption, secrecy and irresponsibility in national and international affairs, and finally plays a prominent part in fomenting war and national antagonisms.

Nevertheless, it has been thought advisable to give some indication of the general framework of nationalisation and control.

1. THE PRACTICABILITY OF THE PROHIBITION OF THE PRIVATE MANUFACTURE AND TRADE IN HEAVY ARMS AND THE INSTITUTION OF A STATE MONOPOLY.

It is plainly impossible without access to the documents and books both of the firms involved and of the government departments which deal with them, to put forward any detailed schemes of nationalisation. This is very much more the case when dealing with the heavy armaments industry, which has neither the trustified and monopolistic nature of the chemical industry nor the comparatively simple, though as yet un-coordinated units which characterise the aircraft industry.

The heavy armaments industry has already been described in some detail together with that of the main essential raw materials which are frequently under the same control as that of the completed armaments. It has been shown that the firm of Vickers Ltd. dominates the industry and that this group is the centre of a complex group which has ramifications in this and in other countries, in firms producing raw materials and accessories, in banks and in other directions which give it a dominating influence.

Whilst in the chemical and aircraft industries the point was made that the plant used for producing commercial goods is capable, often with very little modification, of producing war goods, and that similarly in the aircraft industry, the same plant would be used for producing civil planes capable of use as military planes, and that aero engines could be used for either type of plane, in the heavy arm industry this interchangeability is rarely found. There is no peaceful use in a 16-inch gun and no one can pretend that a torpedo has any commercial utility.

The principle has already been adopted to a great extent of dividing the production of military arms from that of civil goods. Thus, in the Vickers group which, in view of its predominating importance, is in this memorandum taken as the basis for discussion, most of the railway wheel and axle business is done at Taylor Bros., armour plate production is centred at the River Don works, heavy castings at the Grimesthorpe works, and tools at Openshaw. The forge departments at Darlington Forge and Openshaw have been closed and forging operations centred at Sheffield, while the drop forgings works at Elswick and Attercliffe are being merged into one big department at the River Don works. The amalgamation of Vickers' and Cammell Laird's railway interests took place under the Metropolitan Cammell Railway Wagon and Finance Co., and a further move has been the formation of the Firth-Vickers Stainless Steel Co., absorbing the stainless steel business of Firth Brown and English Steel Corporation.

If this concentration is a move for productive efficiency, then it appears reasonable to assume that a concentration of armament production would also lead to greater efficiency. If the concentration of the armour plate production of Vickers, Armstrong Whitworth and Cammell Laird has proved economical, then would not the absorption of the armour plate production of Firth Brown and Beardmore under a government control be a further step towards greater efficiency?

The differences between the production of steel for armaments and that for commercial products start from the time the raw metal is placed in the furnace. This definite distinction between arms and civil production is a factor of enormous importance in the consideration of the practicability of the institution of a state monopoly in the heavy arms industry.

The principle of separation is already admitted in the memorandum* on the abolition of private manufacture and the nationalisation of the manufacture of arms presented to the Disarmament Conference by the French, Spanish, Polish and Danish Governments in 1933, in which they state:

"The abolition of arms manufacture is not designed to concentrate in the hands of the State all manufacture that might serve to produce arms.

"The sole object is to reserve to the State that part of industrial production whereby a product undergoes the first transformation which renders it unfit for pacific purposes and destines it exclusively for military use."

Arms which in the process of manufacture are produced separately from all commercial work from the time when the pig iron, scrap steel and alloy additions are charged in the steel melting furnaces, include the following:

- (a) Armour plate for ships and tanks.
- (b) Armour piercing shell.
- (c) High explosive and shrapnel shell.
- (d) Air vessels for torpedoes.
- (e) Gun forgings.
- (f) Gun shields and barbettes.
- (g) Communication tubes.
- (h) Castings for turbines, gun mountings, etc.
- (i) Ship castings.

Materials required for high explosive and shrapnel shell could be purchased in bar or billet from outside sources and subsequent operations carried out in a government arsenal. But, as far as the other articles are concerned, it is essential, owing to their size and their composition and the heat necessary, that they should be finished in the works where they are cast up to the final machinery stages at least. Thus, a separation of the manufacture of heavy arms from that of commercial steel goods, which is a practicable consideration, must assume the government's ownership and control of the steel works necessary for the manufacture of the war stores enumerated above.

The standard case will undoubtedly be put by the arms firms and possibly by the service departments associated with them that private manufacture is:

- (a) essential for rapid expansion on the outbreak of war, and
- (b) more efficient.

With regard to (a) Dr. Addison has proved that on the basis of his experience during the last war, this is not true. Further, in his memorandum and in subsequent cross-examination, he gave reasons why it was correct to assume that private firms would fail just as much in the event of another war to satisfy the requirements of expansion.

Dr. Addison also gave many illustrations of the inefficiency of private firms during the war period.

* Conf. D/C.G.48. Geneva. March 4th, 1933. Pages 8 and 9.

Whilst there may have been extenuating circumstances at that time, they do not apply to-day.

But taking Vickers as an example, and it with its tremendous capital and widely spread industry has every facility for efficiency, it can be shown that the same inefficiencies characterising the private firms during the war characterise them to-day. Indeed, these inefficiencies are inherent in the system of private manufacture. The following are taken as representative examples, and it is suggested that if access to complete information were available they could be enlarged and others discovered.

LOSSES DUE TO THE JOINT MANUFACTURE OF ARMAMENT AND COMMERCIAL STEELS IN PRIVATE FACTORIES.

Technical Losses.

1. *Works layout.*

The largest part of the steel required for armaments in this country is manufactured in the Brightside district of Sheffield. The arms firms manufacturing them are:—

E.S.C. Ltd. (Cyclops works); Thos. Firth & John Brown (Atlas and Norfolk works); E.S.C. Ltd. (Grimesthorpe works); E.S.C. Ltd. (River Don works); W. Jessop & Sons (B.S.A. subsidiary); Firth & Brown (Tinsley works); Firth-Vickers Stainless Steel Corporation. Firth Derihon Drop Forgings and Hadfield.

Throughout the area runs the River Don which provides a supply of cheap water, a barrier to efficient works layout, a hindrance to internal transport, and an annual flood. The works are riddled with roads which split them into awkward and uneconomic pieces, and the internal railways are a collection of shunting stretches and acute bends. Not one of the works has been planned as a whole but each firm has gradually grown and has acquired land wherever possible without regard to efficient layout. Amalgamations have taken place but have not resulted in big changes of internal structure, a policy being pursued of concentration into certain units without radical alterations. It is true that E.S.C. has spent above £1,000,000 this last two years on new plant and buildings, but it has been a policy of tackling the different manufacturing units one by one without due regard being paid to the whole. When the representative of this great corporation declared in open court that rationalisation was "a word which originated in Parliament to mean amalgamation" it was a sufficient insight into the business mind of the arms manufacturers.

When a works is laid out for the production of several types of product, it is obvious that the layout cannot be as satisfactory as if it were designed for one product only. For example the armour plate departments of E.S.C. are situated fairly close together, but even so a plate must cross the main Sheffield-Doncaster road by a level crossing no fewer than four times in the course of its production. A distance of three-quarters of a mile separates two armour plate departments of what was formerly Cammell Laird's works at Grimesthorpe and Cyclops, and though the latter works is not producing at the moment, arms products have still a rail journey to make from Grimesthorpe to River Don works. There is a big transfer of steel between E.S.C. and its subsidiary company Industrial Steels—1½ miles apart—and Firth Brown manufactures steel in the Atlas and Norfolk works to be finished in the Tinsley Works.

2. *Administration.*

The steel firms will be eager to point out that administration expenses upon armament steels are much heavier than upon commercial. What they will not be so eager to see is that the wider range of products in a single factory, the greater must be the administrative problems, consequently the heavier the expenses. The segregation of armament production into a national factory would, whilst not overcoming the technical difficulty of each job being an individual job demanding special care, considerably lessen the administrative difficulties.

Nor would the government have to bear a proportion of that costly world wide selling organisation which Vickers emphasised so much during the War.

3. *Material control.*

An earlier reference was made to the trouble caused to all steel firms by the mixing of various types of scrap and materials. It is partly for this reason that there is an inclination to limit the number of brands of steel produced as no matter how carefully scrap bins and steel oddments are marked there is always the likelihood of low grade scrap getting into an armaments cast, or of nickel steel scrap being wasted in producing a cheap commercial steel. Ingots and surplus pieces of steel have a habit of lying around for months and occasionally years, and as records are expensive to maintain in an up-to-date condition it is often the practice to dispose of steel above a few months old by remelting it. The saving resulting from a complete separation of cheap and armament steels might not amount to a great deal in this direction but stock control problems would certainly be simplified.

4. *Compromise in plant.*

It is self evident that the manufacture of say Morris Oxford and Rolls Royce cars in the same factory would not be an economic proposition. It is surely just as absurd to associate straight commercial steels with high class armament steels. Reference has been made to the unsuitability of gun turning lathes for commercial work, and though the manufacture of the two types of steel is separated to a large extent, certain compromises have to be made in plant equipment in those departments where the two are associated.

Other things being equal, the rate of melting in an open hearth furnace is determined by the ratio of weight charged to hearth area. When a furnace is built a balance must be struck between lowering the melting cost by extending the hearth area and raising the overhead costs by investment in more bricks, framework and floor space. The more expensive a steel is to melt—the arms steels are the most expensive—then the greater will be the saving by an extension of the hearth, though the cost of increasing the hearth will be the same in all cases. Thus a hearth can be extended more if the furnace is to melt arms steel exclusively than it can be if to melt both, consequently a compromise does not permit of the lowest possible cost of production.

The capacity of a furnace (i.e. quantity of molten steel it is designed to hold) should be determined by the average size of a cast. As commercial steel casts are more numerous than arms steel casts the furnace will tend to be of the size required for their production and not of the latter.

Other examples could be given of the disadvantages arising from compromise.

The tendency in the commercial world is for bigger and bigger steel products. I.C.I. requires tremendously large high pressure vessels and solid forgings replace items which were formerly built of several parts. But the demand for arms steel is not in the direction of larger ingots. The largest required is about 100 tons, whilst commercial ingots are now up to 200 tons in weight, and the armament ingots have to share the cost of fitting the melting house and forge with equipment capable of dealing with up to 250 ton ingots though they themselves do not need it.

5. *General inefficiency.*

The Government appreciates that the steel industry is still very inefficient and badly organised for they made the granting of tariffs conditional upon reorganisation, the undertaking of which has been consistently avoided by the industry since the tariffs were granted. Progress has been made in several directions but rationalisation is yet unknown.

What applies to the whole industry applies equally to the heavy firms. When Vickers-Armstrongs and Cammell formed E.S.C. there was little consideration given as to the course of future developments.

Concentration did take place in the making of certain products, but works were closed with a rapidity which cost thousands of pounds. Cammell Laird's works at Penistone were closed down overnight, though three or four furnaces were under gas—it costs over £100 to light up a furnace—all of them were in excellent repair and there were large stocks of iron ore, pig iron and scrap steel available. The correct policy was to have turned all the stocks into ingots and had them transported to the works requiring them. Instead the stocks of raw materials were moved and the furnaces deserted, to be pulled down three years later and rebuilt in the River Don works.

The Motor Car Crank Department (machining drop forgings) was situated in the Attercliffe works, Sheffield, of Vickers. Certain of the machines were moved into the East Machine Shop at the River Don works in 1930, found unsatisfactory there, and were returned to Attercliffe. A few months later all the machines were moved to the Grimesthorpe works at a cost of not less than £15,000. Eighteen months later all the machines were moved into the East Machine Shop, River Don works, again at a cost of thousands.

Instances similar to these can be recited *ad nauseam*, all going to show that there was little coherence in the technical planning of the company. It was realised that the works site was not of the best, and the chief engineer and others inspected a site at Poole, bordering on the sea. Chiefly on the score of the distance from coal the scheme of moving the E.S.C. works away from Sheffield was turned down. Instead the River Don works have been repaired piecemeal. The melting house was brought from Penistone, forging presses from Openshaw, machine tools from Openshaw and Grimesthorpe, and drop stamps from Elswick. As a contrast to this, the United States Steel Corporation and the Thyssen Group in Germany have abandoned the practice of reconstructing a works that has fallen behind. They allow it to carry on while they set up new works of the most advanced type to take its place; when that is ready the old is dismantled and either abandoned or rebuilt entirely.

The other heavy arms firms do not appear to be run on any sounder lines. If it be asked how, despite these inefficiencies they manage to continue in business, the reply can be found in a slight twist of the famous question and answer:

"Why do heavy arms firms make profits?"

"Because they only have other arms firms to compete with."

Commercial Losses.

1. Capital losses.

The chairman of Stewart & Lloyds, referring to the steel industry in his recent annual report, declared "Figures which have been supplied to me show that on a rough estimate £58,000,000 has been written off since the War, representing some 60 per cent. of the capital invested." The Government has not had to bear any portion of this loss directly—apart from an offset against income tax liability—but the effect of financial weakness in the industry was ably stated in the Balfour report. A company which is financially weak cannot borrow capital and the prospect of profit being the sole attraction for investors and bankers alike and without capital the company cannot raise the level of its efficiency. It therefore is in no position to lower its prices and share out its overhead costs on an enlarged output as an immediate loss would be unavoidable. The tendency will be for it to maintain prices, to squeeze as much as possible those customers who can afford to pay, and to lower costs in turning out an inferior article.

With the exception of the South Sea Bubble, Britain's financial history has few things more spectacular to offer than Vickers' investments after the War. £17½ millions in a few months, and the larger portion of it lost in a very short space of time! Armstrong Whitworth crashed just as heavily on speculative undertakings unconnected with armament making. Vickers' shares were written down,

so were Armstrong's, Cammell Laird's, Brown's. Recently Hadfield reduced its capital from £2½ to £1½ millions, Darlington Forges has gone, and though Vickers had the opportunity of a review of the capital assets they bungled two amalgamations by way of E.S.C. and the Metropolitan Rail & Carriage Co.

Vickers has always held a strong financial position but even it appeared chary of investing money in E.S.C. After the latter's reconstruction in 1931—incidentally not with the full approval of the auditors—although the chairman of Vickers complained of having to hold securities returning 3½ per cent. instead of financing the building of battle-ships, yet E.S.C. had to clear out obsolete machinery and plant at any price in order to raise funds, though the scrap market rose rapidly during the same period. The reconstruction of E.S.C. plant commenced in 1932, and is intended to cost about £1½ millions. The works were in a pitiful state, and half the machinery was out of date. The melting furnaces were very old, and gas leaked from the underground chambers of one into the next. Owing to these leakages the cost of melting was high. It was probably due to the loss of heat that charges were often composed of 25 per cent. scrap and 75 per cent. pig iron, reversing the usual proportion, for pig iron is more easily melted than large pieces of scrap. Pig iron at that time was costing double the price of scrap, and also requires larger additions of iron ore to be made to the furnace for purifying the charge.

In the financial scheme for reconstruction E.S.C. had an item of £100,000 reserved for "Deferred Repairs". Actually the whole reconstruction was a deferred repair, but the figure is quoted merely as an illustration of the way in which necessary repairs were arising and being shelved. The tendency was also to neglect departments which at the moment appeared to be surplus to requirements. In a sudden emergency Cyclops works was certainly in no condition to commence the manufacture of armour plate immediately. Similarly other firms allowed plant to decay. Hadfield's shell forging shop was deserted, the engineer's observation being "Don't touch it any more; let it rot." Beardmore, prior to the trade revival of this last two years was in a very shaky position, and it is certain that in the cheeseparing necessary to reduce losses the working efficiency of various departments would be impaired.

2. Budgeting.

There are numerous ways of indicating that from a financial and administrative point of view, the manufacture of armaments should not be conducted in association with commercial activities. "Budgeting" is a feature of all modern business firms, but there must be few industries where it is of less use than in the steel industry, subjected as no other to the vagaries of the trade cycle. What, for example, could be planned in E.S.C. where the annual trade from 1930 onwards was, in round figures £3,000,000; £2,000,000; £1,300,000; £2,000,000 and £3,000,000. At one period—early 1932—the melting department had to commence the week with only two carts on order—each furnace made about 11 carts per week and there were three furnaces working—therefore the melting costs of necessity were very high. Firth Brown was in just as bad a position, only their electric furnace producing stainless steel running economically, and similar conditions existed in all heavy steel firms. As the prices charged to the Government are influenced by costs of production it will be appreciated that this uneconomic manufacture, due to changes in the commercial world and not to any governmental factors, sends up the prices of arms products sold to the Government.

3. Depreciation.

A general rate of depreciation is charged into the manufacturing costs of all steel products, the rate allowed for arms and commercial steels being 7½ per cent. on plant. But reference has been made earlier to the vast difference in the speed of manufacturing the two types of steel, and as speed is

the biggest factor bearing on the rate of depreciation, that rate cannot be so high on arms steels as on commercial. Nor, since methods of manufacturing armour plate and guns change but little, is there the same tendency for machines to become obsolete.

The average age of the machine tools in Cyclops works must be about 35 years, some of them dating back to the 80's. Similarly the machinery in the planing shops at River Don works is considerably older than the average machine in the commercial departments. Last year two big planing machines were taken out of storage and rebled in preparation for the increase in armour plate work, the machines being about 25 years old. Although so old they were no more dated than the other machines in the department. This does not infer that the machines used on armour plate work are out of date, but only that they have a much longer useful life than general machinery.

4. Associated companies.

All the heavy arms firms are linked up with companies which supply them with raw materials, or equipment, or serve as an outlet for their products. Hadfield owns Bean Industries Ltd. for the disposal of some of its steel, Brown the Carnforth Iron Co., who supply it with pig iron; Armstrong Whitworth has Armstrong Saurer, Armstrong Siddley Motors, Craven Bros., etc. Whilst this association is presumably for the benefit of the parent company it is possible for it to prove a disadvantage on occasions. The tendency is for all requirements to be supplied by the associated company, whether its product is the most suitable or not. Last year the management of the machine departments in E.S.C. was forced by higher authority to buy certain new lathes from Craven Bros., although it was a well known fact that its lathes were vastly inferior in quality and performance to others which had been offered.

In this connection various contracts between distinct firms should be noted. Quite frequently industrial concerns arrange trading on a reciprocal basis. Thus E.S.C. has a very large trade with Stanton Coal & Iron Ltd., in the manufacturing of steel moulds for casting iron pipes. In return E.S.C. buys all its coal from the Stanton concern. Whilst this mutual trading is of mutual benefit there may be occasions when it is disadvantageous in part—different furnaces, different boilers, and different departments need different qualities in the coal they consume. On sundry occasions the Stanton coal was known to be not the most suitable in certain departments, but no change was made as all coal had to be purchased from that concern.

5. Monopoly.

As a government factory would have a monopoly in the production of armaments, it might be suggested that the same criticisms can be levelled in that direction as against the closely linked steel arms.

But one point should be noted. The big steel firms get together to arrange for quotations to the Ministries, and also collaborate in the preparation of "costs." Admittedly there are government auditors who investigate the various accounts and who, on occasions, cut the prices charged by 50 per cent. But the Government is in no position to quarrel seriously with the arms firms on the prices of materials supplied, and assuming that the auditors are competent enough to criticise costs, then it can only be assumed that they are prepared to pass a blind eye over some of the "slightly" inflated accounts.

These various points are sufficiently clear indication of the ineffectiveness of a joint system of armament and commercial manufacture by private firms.

A concentration of armament production under the control of the Government is not only practicable but would be more efficient and less costly to the British taxpayer.

There can only be one serious objection to such a concentration and that not a technical one; the question of strategy. To have all production centred in one works would mean the focussing of aerial attacks in the event of war and a corresponding vulnerability. But it has been pointed out that manufacture of the larger portion of arms steel is already carried out in the Don Basin and the works cover an area large enough to provide an easy target from the air. The obvious policy is to build a new works of the latest type, designed specifically for the production of armaments only, and situated away from the present heavy steel works, either in another part of Sheffield or removed to a safer spot on the North West coast, near to haematite pig iron supplies, and a government yard for the scrapping of warships, thus securing scrap armour plate steel supply. The present armour producing departments of the heavy steel firms would be taken over and, if efficient enough for the purpose, retained as reserve capacity, or if not efficient then certain of them would be overhauled and made so. The works to be erected would have an open hearth steel melting plant of approximately the size of the present E.S.C. plant.

This would have an output sufficiently large to meet all normal armament steel demands and, in the event of war, orders would be placed for steel with the high quality steel producers. There would not be the same dependence on the armaments group as many firms are now making high quality steels; the firms who failed the country so badly in the last war would not be permitted to repeat the offence. With the centre of the armament industry governmental control expansion would be very rapid, and the difficulties of such expansion would be very minor ones compared with those to be contended with if the industry remains in private hands.

The vast increase in the automobile industry since the War puts a reserve armament producing capacity in the hands of the Government far greater than anything hitherto available. From Dr. Addison's story it is obvious that we could not have carried on the War without a Ministry of Munitions; it appears equally obvious that we ought to have that Ministry in action before the commencement of another. A survey of the existent armament steel firms will reveal that they have not such a very large productive reserve in hand themselves; so called rationalisation has closed down works and, again directing attention to the leading firm in the group, it is worth while to see what Vickers' subsidiary, English Steel Corporation, can offer by way of production. In 1929 on the formation of the company it possessed the following steel-producing plants:—

River Don Works: 12 O.H. furnaces, 3 electric furnaces, 1 steel convertor, gas and coke crucibles.
Grimesthorpe Works: 3 O.H. furnaces, 2 electric furnaces.

Penistone Works: 5 O.H. furnaces.
Openshaw Works: 10/12 O.H. furnaces, 2 electric furnaces, gas crucibles.
Cyclops Works: Crucibles.

To-day it possesses the following only:—

River Don Works: 4 O.H. furnaces, 3 electric furnaces.
Grimesthorpe Works: 3 O.H. furnaces, 2 electric furnaces.
Openshaw Works: 1 electric furnace, gas crucible.

E.S.C. would therefore have to seek assistance at a very early stage of an abnormal demand; its steel-producing capacity together with its subsidiary companies of Darlington Forge and Industrial Steels can amount to no more than 200,000 tons per annum, yet shell steel alone demanded 12 million tons per annum during the later part of the War. An association with other firms would be much more easily and quickly established by the Government than by the arms group.

So far as peace-time production is concerned it would be difficult to envisage a large government factory as inefficient as the heavy steel firms are to-day, in spite of their much vaunted reorganisation. One can hardly imagine a state factory

spending well over £100,000 per annum on coal and not having a fuel expert in its employ. No one can foresee it decaying to the extent that the maximum efficiency of any of its hydraulic pumps reaches the princely figure of 23 per cent. Information has already been given bearing upon certain of the disadvantages arising from the joint manufacture of arms and commercial steels so little further need be said here. Only slight reference has been made as yet to the stages of armament manufacture subsequent to the steel works which are generally of higher efficiency than the latter and comparing favourably, so far as their technical methods are concerned, with the Royal Ordnance Factories and State Dockyards.

Sir Eustace D'Eyncourt has given his considered opinion upon the respective efficiency of private and state manufacture and ascribes the better results of the former largely to the more favourable atmosphere existing for employees. He quotes the extent to which the State has drawn upon private trade for inventions and personnel, and gives the Armstrong gun, Parsons steam turbine, wireless, the internal combustion engine, and the aeroplane as typical examples of the products of private enterprise. Not even he, however, suggests that it would be a desirable thing to hand over the Navy to private enterprise, and we feel sure that he will consider the State concerns of the Navy and Air Force to be efficient. It would indeed be a surprise were they not so, considering that 99 per cent. of productive activity is privately directed. It can also be noted in passing that only the first of these inventions was the product of an arms manufacturer. There is no reason why the State should not continue to draw upon the inventive resources of private trade; a monopoly of engineering brains is not possessed by the arms firms as was amply demonstrated during the War when novices at shell production were able to produce so much more cheaply than they. The biggest improvement in armour plate manufacture, coming at a time when the shell appeared to be winning the duel handsomely, was the process of cementation, a discovery not of an arms manufacturer but of an American civil engineer by the name of Harvey. The country would therefore not be divorcing intelligence from arms production by the withdrawal of the private manufacturer from that sphere of activity. And as for that enervating atmosphere of a state factory which Sir Eustace fears will give only an average mediocrity of production, surely "the several small points which tend to damp down the ardour and keen inventive capacity in the Government service" are capable of rectification. The Admiralty and War Office through their dependence upon private manufacturers have not had occasion to attack these problems, but different circumstances would affect their administrative outlook and it is only reasonable to suppose that they of all people would see that the production and design of arms were on an efficient footing.

To sum up this statement of practicability regarding the heavy armaments industry:

The case of the heavy armaments industry differs from the other industries because it is the more closely linked with oldest industrial factory system. While it has been clearly established in the review of this industry that on the technical side the heavy arms industry can be differentiated from the general body of industry, yet many of the works are very closely linked with engineering works. The works are scattered over a wide geographical area and associated with other sections, both for technical and financial reasons. The technical discussion given leaves no doubt that we can separate these sections. Therefore nationalisation of the armaments section alone can occur. However, we are of the opinion that the complete nationalisation of the iron and steel industry is the only valid method of approach, because even if the armament section is nationalised, the position might arise in which this section dealing in highly specialised products would be under the control of a complete iron and steel trust which would be suppliers of the fundamental material for such products.

The type of control suggested must be safeguarded against such a state of affairs. This could be achieved by strict inspection of the books and works, etc., of the firms involved. The industry should be under the control of boards constituted as follows:—

- (a) Representatives from Government Departments concerned (technical, administrative and financial);
- (b) Representatives of managerial and administrative sections from the works themselves.
- (c) Democratically elected worker representatives from the workshops involved.
- (d) Representatives of the ancillary non-military industries which are responsible for the raw material supplies.

The relations with research organisations must be carefully worked out for many reasons, but especially in order to see that military research is not carried out in the civil research department or financed from the civil estimates, and also to prevent the type of technical inefficiency which is so prevalent in the privately controlled armament industry to-day.

This procedure would undoubtedly prevent the widespread corruption which has been shown to exist, increase the technical efficiency, and, as Dr. Addison has shown, reduce the financial cost to this country.

2. THE PRACTICABILITY OF THE PROHIBITION OF THE PRIVATE MANUFACTURE OF AND TRADE IN CHEMICALS AND EXPLOSIVES AND THE INSTITUTION OF A STATE MONOPOLY.

The terms of reference of the Commission in Clause I call for consideration and report upon the practicability of state monopoly of the armament trade. The practicability of state monopoly is conditioned by both economic reasons and by military expediency.

The problem of nationalisation as applied to the industry of chemical warfare, with its two main groups of lethal substances and explosives, may be regarded as simpler than in the case of the aircraft industry and considerably simpler than in that of the heavy armaments industry. The industry of chemical warfare has been shown to be under the virtual control of one great combine, Imperial Chemical Industries, Ltd.

But just as in the aircraft industry civil aircraft may be converted to military aircraft, and the same factories and technical equipment used for both, so in the industry of chemical warfare and explosives industry, chemical factories, especially dye-works and factories connected therewith, can be very quickly adapted to the manufacture of poison gases. In the dye-works many of the intermediates are themselves lethal chemicals, which are capable of immediate use in chemical warfare, whilst others are intermediates from which lethal substances can be readily prepared.

The problem is rather different when the manufacture of explosives by the chemical industry is to be considered. The plant used for the production of industrial explosives and sporting ammunition is already separated to a great extent from that which produces military ammunition. But it is nevertheless correct to say that the differences between the pacific and military uses of explosives (excepting as propellants) are so ill-defined that it is difficult to separate them.

The existing organisation of the industry, with special reference to this problem of the inter-relatedness of commercial and military production, has already been described in another section.

Without access to complete information it is plainly impossible, and certainly undesirable, to put forward any detailed scheme of nationalisation. The policy has been adopted, therefore, of indicating those main problems without an adequate consideration of which it is maintained there can be no satisfactory fulfilment of the terms of reference of the Royal Commission.

As the attitude of I.C.I. and of its shareholders must be those of a concern solely engaged in profit making, its reorganisation takes no account of great local disturbances of trade and dislocations of labour,

with a nett loss to the state, excepting where good commercial policy makes such consideration essential, and it cannot, obviously, make any provision beyond that required in commerce for productive capacity to meet national defence.

In addition it is a danger to national interests that an organisation of this size and influence should make private and secret commercial treaties very often dealing with supplies of essential war materials which should be under state control.

An interesting, and on the whole, admirable organisation has been built up which could most usefully form a basis for state ownership, with little organisational change. The fact that the technical control both on the manufacturing and sales side is in the hands of a highly trained managerial staff means that personal goodwill, the holding of which might form some difficulty in the intermediate stage of state control of other industries, does not create a serious problem here. The major loyalties could be directly transferred to the state.

The following groups would seem to be the natural ones for the control of the chemical industry:—

(i) Dyestuffs (for dyestuffs, related organics, synthetic rubber, etc.).

(ii) Syntheses (for ammonia and ammonium compounds, coal, oil, cements and all high temperature/pressure syntheses).

(iii) Explosives (for industry and military explosives, nitro-cellulose, collodion, lacquers, etc.).

(iv) General Chemicals (for alkalis, acids, bleach, chlorine, and related organics).

(v) Non-ferrous metals (for copper and similar non-ferrous metal tubes, sheets, strip wire, etc., and ammunition casings). This group is debatably chemical, but is included because of common ownership.

(vi) Miscellaneous division (for handling the production of final materials discovered by the industry, from the intermediates supplied by the other groups, if these final products require exceptionally different mechanism and organisation).

Such a series of groups would have to be co-ordinated both for sales and production facilities with the following:—

(i) Gas Works and Coke Oven Plants.

(ii) Oil Industry.

(iii) Fermentation Industry.

(iv) Soap Manufacture.

(v) Cellulose Industry.

It should be pointed out that such grouping is not dissimilar from the main grouping of existing chemical interests.

There remains the problem of the export market, in connection with which the essential interchangeability of certain products admittedly makes many complications. To include any of the secondary materials in this category would be insufficient and raw materials as well as finished goods should be included.

The intermediates, both in the manufacture of poison gas and of explosives, must also be considered, since, if this side of export trade be omitted, it will be seen that the way is left open to a more geographical redistribution of production, particularly in view of the present ramifications of the industry.

In the case of explosives, the varieties are so great, and the difference between pacific and military use (except as propellants) so ill-defined, that it is impracticable to separate them.

It might be stated here that the size of the explosives trade must not be overlooked. A total of 20.8 per cent. of high explosives and propellant manufacture is exported and 50.6 per cent. of the military small arms ammunition was exported in 1930 as against 38.4 per cent. in 1924. Over 60 per cent. in value of the present explosives manufacture is for purely military purposes, and these supplies are the most profitable. The value of the explosive industry is not exactly known, but it may be assessed at about £20 million with a personnel of 9,000.

In the case of poison gas, there are certain poison gases which have commercial uses and others none. The details of poison gases and explosives are tabulated below.

Considerations that we have borne in mind are the reasonable technical division in type of process, and the favourably low capital costs of our proposal at this dividing point.

It is proposed:—

(a) That all explosives (excepting black gunpowder) whether for industrial or military purposes be manufactured by the State from the raw materials and intermediates supplied by the private chemical manufacturers.

(b) That licences for export of all raw or semi-finished materials likely to be used in the manufacture of explosives or poison gases be issued by the State. A schedule gives the details of these commodities.

(c) That the private manufacture of certain poison gases be prohibited. The reagents in question are given in the schedule of commodities.

Schedule of Commodities requiring licence for export.

(1) Explosives manufacture (Intermediates). Sulphuric acid, nitric acid, refined glycerine, alcohol, toluene, ammonia or ammonium compounds, picric acid, acetone.

(2) Lethal gases, solid and liquid (Intermediates). Bromine, xylene, acetone, picric acid, sulphur chloride, ethylene, acetylene, arsenious chloride, sodium nitrite, sodium arsenite, sulphur dioxide, methyl sulphate, pheno-sulphuric acid, white arsenic, phenylarsenic acid, phenylarsenous acid, benzene diazonium chloride, diphenylarsenic acid.

(3) Lethal gases, etc. Chlorine (Phosgene, export forbidden).

Schedule of poisons prohibited for private manufacture or recovery for sale.

Sulphuretted Hydrogen, Prussic Acid, Benzyl Bromide, Xylol Bromide, Bromacetone, Chloropicrin, Mustard Gas, Lewisite, Diphenylchlorarsine, or any other gas, liquid or solid, of which a lethal dose is less than 10 milligrammes per litre of air, excepting chlorine and phosgene.

The Basic Methods for Control of the Chemical Industry.

The consideration of the major technical aspects in establishing this control in relation to the different problems arising will now be considered.

The export of lethal substances and of explosives would be regulated, the licensing of these materials being the function of an Exports Licensing Department with Board of Trade and Foreign Office representation. Thus the worst abuses of private trade in arms may be overcome.

The type of organisation which has been suggested is not dissimilar from the main grouping of existing chemical interests, the change would not produce any adverse reaction upon other industries, and we believe that the ratio of economic change to peace security brought about by its means is very favourable.

To rely upon the type of licensing in use at present is not enough. That system has allowed abuses of all kinds to flourish.

It is, however, possible to devise schedules of materials that should be subject to licensing for export or for export prohibition.

We do not believe that it would be sufficient to rely on the licensing of explosives for export. Their varieties are so great, and the difference between pacific and military use (excepting as propellant) so ill-defined, that it would be impossible to check their end, and only the complete elimination of private profit from the manufacture of explosives would meet the case. In addition, intermediates for explosives manufacture would need to be licensed to control overseas finishing. The great importance of full control of the explosives industry must be emphasised.

The licensing for export, or prohibition of manufacture or export of poison gases, though it does not meet completely with the full requirements of control is yet better placed in that respect than are explosives and ammunition. They are more susceptible to control in that manner, as the special requirements for carriage makes declaration of identity imperative, and since chlorine, the one exportable gas upon our lists, is much less efficient for gas warfare than many others, it is not likely to be used as a direct war agent. In order, therefore, to use it for war purposes reaction plant is needed to produce the more virulent gases. It is more usual to find the abuses of the arms trade in connection with final products rather than in intermediates.

Therefore, though we believe that the full control of the industry is essential to a complete scheme, and that such control would give a more than equivalent security, it is our belief that the state monopoly of the explosives industry and the licensing and manufacture of poisons, would give a greater measure of security per unit of expenditure and industrial interference.

We believe that the dangers involved in the private manufacture of arms are of an order that would justify the state monopoly of manufacture, and consider that the insurance against those evils is not to be considered as involving high capital outlay.

In order of advisability of control we would place:—

- (1) Explosives.
- (2) Poison gases.
- (3) Intermediates.

To cover these materials, we have shown that it is advisable to establish a rigid public and efficient control in the following industrial groups:—

- (i) Heavy chemicals.
- (ii) Dyestuffs.
- (iii) Explosives.
- (iv) Portion "Fine Chemicals."
- (v) Portion "Cellulose."
- (vi) Portion "Paints and Varnishes."

These schemes of segregation are incomplete, but it is claimed that they afford a working basis for a more complete investigation in which the services of expert panels would produce more detailed results.

The type of control which seems to us to be essential would consist of boards on which were represented the government officials, both technical, administrative and financial, representatives of the technical, managerial and office (accountancy) staffs, and also representatives of the workers elected democratically by secret ballot in the factories. If the complete nationalisation is not accepted then representation would be given to the investor. These boards would in all cases be of four main classes, Co-ordination (for different products for various factories, e.g., intermediates), National, Regional and Factory. All the management of the nationalised industries to be subject to Parliament so that debate could occur and questions be asked with regard to its position and management.

3. THE PRACTICABILITY OF A PROHIBITION OF PRIVATE MANUFACTURE OF, AND TRADE IN, AIRCRAFT, AND THE INSTITUTION OF A STATE MONOPOLY OF SUCH MANUFACTURE AND TRADE.

The nature of aircraft production and development and the nature of the aircraft industry have been described in the preceding pages.

Military and Civil Aviation.

The industry is of a type and at a stage of development where the problems of nationalisation are fewer than in the heavy armaments industry, for example, the factories are all purely aeronautical and they are mainly dependent on government orders excepting de Havilland and the very small firms. The problem of civil aircraft, however, and their convertibility to military aircraft raises special issues for the aircraft industry. The production of civil and military aircraft might well be separated, but in our opinion the case for abolition of private

trade extends to the civil as well as the military section.

The problem of adaptability raises vital problems from the international point of view and more particularly would seem to indicate the doubtfulness of any solution of the problem independently of a scheme for the international control of aviation. Any trade in transport planes may be a virtual arms traffic. The private trade in civil planes may easily stimulate rivalry in air fleets, and in so far as civil aircraft have, or can easily be converted to have, real war value, the private trade would be indirectly working for a race in potential armaments. It is true that there is some difference of opinion on the question of the convertibility of civil to effective fighting aircraft. The transport plane is immediately useful for indiscriminate bombing of cities in cloudy weather, or with an effective escort. It can also be used for staff and other transport purposes. It is not very readily converted to a gun-protected bomber, but civil planes can be designed with conversion primarily in mind, and it would be difficult to check this. The Air Ministry has ordered aeroplanes in convertible forms, and firms are increasingly producing planes which can be converted. Recent aircraft company advertisements have openly stressed the fact that their civil machines are convertible to war planes.

It is neither our duty nor our wish to put forward a detailed scheme for the nationalisation of the Aircraft Industry, or for the international control of civil aviation which would seem an essential corollary. Such a scheme could only be worked out on the basis of complete information which could only be obtained by access to the books and documents of the Air Ministry and the industry. But the following are indications of the main technical problems which are involved.

Research and Technical Development.

It is suggested that two distinct research organisations are required. One should serve the particular purpose of air force development, and the other would conduct general and fundamental research and aim at the development of commercial and civil aviation. While the first organisation would not normally publish its results, all investigations by the latter must be fully published and their laboratories and experimental plants open to inspection at any time. Close contact with both designer and user is essential. It is suggested that some method of organisation is desirable which would bring together, in deciding on technical policy, the Air Staff and the chiefs of design, production and research, for any scheme to be successful. It must be based on the proper co-ordination of knowledge and ideas in the fields of research, design, production and operation. It is this co-ordination which is defective at the moment, as it must be when the work is divided amongst the parts of a competitive private trade and a public service. Under the present system, trade jealousy inevitably prevents the component firms of the industry from sharing ideas and discoveries the combination of which, at any moment, might lead to the best available solution of the problem in hand. The Ministry and its great technical staffs are gravely handicapped in providing such co-ordination, for they labour always under the disadvantage of being prohibited from free communication in the interests of "fair" competition. This position would be greatly simplified by the necessity of complete publication.

Moreover secrecy, which is often important in the development of armaments, can be more easily kept inside a state organisation and as a corollary the information given to designers is not always so full as is desirable for their work.

Aircraft design is peculiarly empirical. Progress calls for a vast amount of experiment. The industry under the present system cannot undertake it all, and only does so to a very limited degree. The state is thus already responsible for an important section of development. State work ranges from research into the basic problems of aero-dynamics, etc., to the most straight-forward testing. Much

of it relates specifically to some design in hand; for example, the capacity of all small fighting aeroplanes to recover from a spin is now tested by small scale models in a "wind tunnel" at Farnborough.

The experimental work of the industry, on the other hand, is almost entirely confined to the design and construction of aeroplanes and engines. *Ad hoc* experimenting, of which there is already too little done, cannot be undertaken by the private industry, and in any case, the conditions of service in a small firm would not conduce to this work being well done. The problem of designing staff must be considered in this connection. A result of the large number of independent units in the industry in relation to the volume of work is a relative poverty in each designing staff. Not only do the firms not specialise as they might each on its own type of aeroplane, but they are unable to set their best men to specialise on parts of a type or particular aspects of a design. In the result, good general conceptions may fail from inadequate attention to detail or good detail be lost in poor general conceptions. More effective drawing offices could be built up in the bigger (because fewer) units made possible if the industry were nationalised.

Effect of Policy on Design.

The present policy of the Air Ministry is certainly open to question in the degree that it seeks progress through competition rather than co-operation. Its usual practice is to have three aeroplanes, and commonly five or six, designed and built in order to arrive at one design suitable for adoption for the equipment of the Air Force. Consideration should be given to the greater efficiency and economy which would result from devoting the same amount of effort to a single design. It is not necessary to go to the extreme of excluding competition, especially in partial design, or to exclude the building of some highly experimental machines and a certain amount of rejected efforts, which are not necessarily fruitless. In fact, in a nationalised industry competition between its servants should be organised and can be without trading competition. But it is suggested that the production of so many experimental machines at the minimum of cost on each and the rejection of at least two-thirds of these hastily conceived products is neither efficient nor economic. Much more might be learnt if the rejects were neither so readily produced nor so summarily rejected, which means for a given expenditure a greater concentration and a smaller production of models, and implies fewer drawing offices.

This is an age of mass production, and with the advent of metal construction aircraft can and must be subjected to such a technique. Design and production by a variety of relatively small firms does not lend itself to such a development, and already signs are not lacking that, even without nationalisation, production will soon be concentrated in a few large firms or combines. This process of rationalisation which is impeded by the present policy of keeping the maximum number of firms floating by dealing out the contracts for experimental machines (with the doubtful object of providing for expansibility in an emergency) could be vastly expedited by immediate nationalisation.

Patents.

Some consideration must also be given to the problem of patents. The home market in purely aeronautical inventions ceases with the nationalisation of design, production and sale. It is suggested that an Inventions Exploitation Board might be instituted to receive and stimulate the development of useful ideas and to adjudicate upon the value and the appropriate award. Such a board could also deal with the problem of the present revenue from overseas in royalties which, under nationalisation, would be the property of the state. Under the present system patents are commonly taken out in the names of a specified person or persons (generally regarded as the real inventor/s) and the company for which he works. The company in these cases probably reaps the lion's share. In the case of

government employees all patents are assigned to the department concerned and the inventors may be rewarded:

(a) by an *ex gratia* award for service use, and/or

(b) by the reassignment of the commercial rights, the Crown retaining the right of free user. Thus the machinery for encouraging invention, under nationalised control of the whole industry, is already in being in embryo in the Departmental Committees which are used to recommend these awards. The Court of Appeal from the Departmental Committee is provided by the Central Committee on Awards to Inventors.

These are the main technical problems essential for detailed consideration in any adequate study of the problem as outlined in the terms of reference of the Royal Commission.

Economics of the Problem.

Further, the economic aspects of the problem warrant careful consideration. Mention has already been made in the financial memorandum of the financial aspects of the problem of the present wave of speculation which characterises the aircraft industry. Such speculation at a time of expansion is inevitable under a system of private firms to whose interest such expansion is a vital factor. By nationalising the industry such speculation would be obviated, with great advantage to the state, which would be saved the money spent to-day in excessive profits made by a competitive industry.

Further, the present arrangement is fundamentally ineffective in ensuring that costs are kept to the minimum. A private industry can organise itself in various ways and stages to cut out the safeguard for the public purse that competition is wrongly supposed to provide. It can have friends at court. Disturbing comment by public audit has been made on more than one occasion upon the non-competitive way in which contracts for aircraft have been placed, while production by the one-time aircraft factory of the state was stopped after a short life and this possible check on trade prices removed. Most competitive industry operates with a number of purchasers as well as a number of producers. In the case under discussion there is virtually only one purchaser, and this invites influence, in one form or another, to dominate success in the peculiar market. Moreover, it is the general practice to place orders, for obvious and cogent reasons, with the firms responsible for the design, and the choice of design must essentially be governed in almost every case by consideration of technical excellence without much regard for cost. Thus, the competitive element in controlling costs is in fact less present than it might be in a public service which would be more under control by the purchasing authority.

The Export Trade.

There remains the problem of the export market which is almost entirely confined to military aircraft. The arguments used for the export of military aircraft are:—

(1) that we need exports to obtain the necessary imports, and aircraft contribute to the total we can sell in the world;

(2) that the export trade in aircraft assists our aircraft industry to meet efficiently our needs for national defence—

(a) by increasing the volume of its production, and
(b) by the stimulus of competition that it provides, and

(c) by increasing the potentialities of expansion

(3) That some big power must equip small powers, unable to equip themselves, in a world which still finds national armaments needed.

As regards (1), the contribution made by aircraft to our total exports is very small and might be disregarded if the question at issue were confined to aircraft; but it is more likely to present itself in the form of the general trade in arms which involves a bigger figure, although apparently not very big.

As regards 2 (a), since the increase in the total volume of aircraft production due to exports, in-

cluding the Dominions, is only about 20 per cent., the effect of exports outside the Empire must be small, and better results would be obtainable by a concentration of our production on a smaller number of units; it is the production per unit which is the important factor in production costs. It is argued elsewhere that this concentration would increase the efficiency of design.

The 20 per cent. increase in production due to exports does, of course, yield a corresponding capacity for immediate expansion in emergency, the most real advantage accruing from exports; but this advantage is not of great moment in the light of the actual figures.

But the argument that export stimulates competition, when applied to military aircraft, is clearly specious, and special pleading, as we have shown elsewhere. For the designs exported are old designs which have been successfully applied to our own service use.

As regards (3) this is an argument which is mainly based on the requirements of vested interests in private industry. And it may be asked whose interests are served when the small powers have been so equipped. This point is really the same as the general problem of relationship of small nations to other forms of armaments. It is discussed most fully in the section dealing with international control.

To sum up, any possible advantages which may be gained by the export of military aircraft are easily outweighed by the evils which have occurred as the result of such traffic in international affairs.

Conclusions.

This memorandum has shown:—

(1) That while the complete state control of the aircraft industry would be the best possible solution, it is also possible to arrange for the state control of the military section alone. It has also been shown that the present indirect control by the Air Ministry of the industry is most ineffective and leads to financial and technical inefficiency.

(2) That the complete co-ordination of military research and development under one authority is essential for a maximum efficiency and progress. The separation of the research organisations for military and commercial purposes is essential especially for the efficient financial control of government expenditure on armaments.

(3) That design effort which is at present dissipated among a number of firms is hampered by the lack of specialisation which would be possible with a greater degree of concentration.

(4) That the present relationships between government and firms *re* patents is very unsatisfactory.

(5) That the export trade, which in any case is not desirable, is not such as to present any special difficulties.

In conclusion it is maintained that the prohibition of private manufacture of and trade in aircraft, and the institution of state control of such manufacture and trade would result in progress in invention and development, in the saving of expense and in the achievement of a greater standard of efficiency. Only under some scheme, of which we have indicated the main technical problems to be considered, can there be the necessary centralisation of research, design and construction which is so obviously lacking in the present system.

The basis of the type of state control which seems to us to be essential would consist of boards on which are represented the government departments concerned (both technical, administrative and financial), representatives of technical, managerial and office (accountancy) staffs of the industrial units concerned, and also representatives of the general body of workers in these units, elected democratically by secret ballot in the factories themselves. If the complete nationalisation of the aircraft industry is not accepted then representation would be given to the investors in these industrial units. These boards would fall into four categories, namely, National, Regional, Factory and Research. Particular care

should be taken to work out the representation of the various industrial units on the research council and of the co-ordination of research council's work with routine industrial work. All the council to be subject to the control of Parliament so that their development and management can be fully debated and discussed.

Conclusions.

In summing up this Part VIII certain basic schemes have been outlined for the guidance of the Royal Commission in considering the problem of practicability.

If a British Government wishes to have an armaments industry free from the inefficiency and abuses inherent in private manufacture, they can have it by taking over the industry, but the detailed methods are for the Commission or the Government to provide, although the Union of Democratic Control would find no difficulty in presenting such a scheme if they felt that it was their function to do so.

Since the Royal Commission may not see its way to accept these views, the Union of Democratic Control in order to assist it in its work has put forward certain modified systems of control which have been worked out in consultation with technical experts.

The approach may be summarised as follows:—

(1) Nationalisation of the Arms Industry.

- (a) Heavy Arms.
- (b) Chemicals and Explosives.
- (c) Aircraft.

Such nationalisation would have to be supplemented by control of the sources of raw materials, e.g., iron, nickel, etc.

(2) Nationalisation of the Armaments Sections of the Respective Industries.

The problem of separation of the production and process from normal industrial work has been dealt with and it has been shown that the technical problems involved can be overcome.

(3) Control through Licensing, Inspection and Publicity.

If the industry is still left in private hands, it is possible to increase control by the following means:—

(a) Improvement in the licensing system already specified in Part VII.

(b) Financial inspection and control.

(c) Separation of the financial arrangements for war and civil research with full publicity.

(d) Inspection and control internally by democratically elected workers in the firms concerned.

(e) International inspection and control.

In the above evidence the Union of Democratic Control has emphasised the inefficiency of the present system of private manufacture and the various abuses that attend it. It has been shown by Dr. Addison to be totally inadequate in time of emergency. The evidence of corruption and irresponsibility brought against the armament rings has never been rebutted. The system which closely connects the arms trade with the public service, while avoiding the salutary sanctions of public control, is contrary to every principle of responsible government. It gives rise to suspicion of evil even when evil may not be present and it makes it only too possible for interested parties to promote their interests in a way which increases national antagonisms and fosters the armament race which is admittedly one of the contributory factors leading to war.

There is no remedy for these evils unless the whole industry is taken out of private hands. The abuses are inherent in the system itself. It is not the function of the Union of Democratic Control to provide a detailed scheme of nationalisation, but we believe that the evidence we have produced relating to the chemical, aircraft and heavy armaments industries gives some useful indications of the lines upon which a scheme of nationalisation might proceed. Our inquiries leave us in no doubt that the technical difficulties of nationalising can be overcome if the Government wishes to nationalise. That the need is urgent and that there is no other way of removing the abuses of the present system we believe to be clearly and finally established.

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

NINTH DAY

Thursday, 10th October, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.
Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G., called and examined.

1216. *Chairman*: You are Major-General Sir Stanley von Donop?

Major-General Sir Stanley von Donop: Yes.

1217. *Chairman*: And you wish to come before us to give a statement in reference to the supply of armaments and various arms at the commencement of the War by private armament manufacturers?

Sir Stanley von Donop: Yes, that is so.

1218. *Chairman*: In order that the position you held at the time may be known, I have a statement here and perhaps you will correct it, if it is not correct. You have been Colonel Commandant of the Royal Artillery since 1925?

Sir Stanley von Donop: Yes.

1219. *Chairman*: You have held the appointments of Professor of Artillery to the Royal Military Academy, Woolwich; Superintendent of Experiments, Shoeburyness; Secretary of the Ordnance Committee; Chief Instructor of the School of Gunnery; Director of Artillery, War Office, 1911-13; Master-General of the Ordnance and 4th Military Member of the Army Council, 1913-16, Commander of the Humber Garrison, 1917-20?

Sir Stanley von Donop: Yes, that is correct, Sir.

1220. *Chairman*: You have supplied us with a statement of what you desire to say. Would you wish to read that to us now as your evidence or would you propose to make a statement independently?

Sir Stanley von Donop: I think it is better that I should read the statement that I made.

1221. *Chairman*: Yes, by all means.

Sir Stanley von Donop: I might preface that by saying that I knew nothing about the assembly of this Royal Commission until I saw a report in the paper of some evidence that had been given before it, and then I read that one of the witnesses had stated that the armament firms of England had absolutely failed in their work at the commencement of the War and during the early stages of the War. As I knew exactly myself what the armament firms had done and had not done during the early stages, I felt that it was only right that, as I and one or two others were the only people who knew the facts, I should bring before this Commission certain statements which would refute what I considered was rather a libel on the armament firms who had done such good work for us. That is the reason why I submitted my name for the purpose of giving evidence here.

1222. *Chairman*: I assume when you refer to a witness you are referring to what was said to us by Dr. Addison?

Sir Stanley von Donop: That is so.

1223. *Chairman*: Have you seen his evidence, or read it?

Sir Stanley von Donop: It was sent to me yesterday morning. I am afraid I cannot say I have read all of it. I read parts of it; but I should not say that I have waded through the whole of these long statements. I picked out some points and made notes on them, which I will give you when I have read my statement. Shall I read my statement?

1224. *Chairman*: Yes, if you please.

Sir Stanley von Donop (reading): I have not seen the Terms of Reference to the Royal Commission but I understand that evidence has been given stating that the large English armament firms failed to supply the guns, rifles and ammunition required during the early period of the Great War.

As I, in my capacity of Master General of the Ordnance, was responsible for placing the orders for this supply, and am well acquainted with the facts, I desire to testify to the real and strenuous endeavours made by all the recognised armament firms to meet these orders and to place on record the reasons why, notwithstanding their efforts, they were unable to deliver the goods by the dates promised when the contracts were placed.

I must commence by saying that previous to the War there were very few firms in England capable of manufacturing guns, rifles and ammunition, and these had received comparatively very small orders from the War Office, so that there had not been much encouragement for them to keep up the plant necessary for expansion in war time.

In the case of rifle manufacturers particularly we had the greatest difficulty in getting them sufficient orders from the War Office, India and the Dominions to keep them going at all.

1225. *Chairman*: Just one moment! When you say there that you had the greatest difficulty in getting them sufficient orders, you mean in peace time?

Sir Stanley von Donop: In peace time; oh! yes. As soon as war was declared the orders to provide the equipment necessary to keep the army in the field were at once placed. These orders were considerably increased directly Lord Kitchener had notified his scheme of increasing the army from 7 to 70 divisions. The various firms were called upon to increase their plant so that we could obtain the additional supplies in the same time if possible as those already ordered and promised.

As the campaign proceeded it was recognized that the number of rounds per gun found to be necessary exceeded by a large amount that previously considered to be adequate.

Other developments had already become apparent such as the great value of guns and howitzers of heavier natures than had been previously taken into the field and the necessity of high explosive shell for field guns. The provision of all these was at once taken up.

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

Orders were given for as much as possible in this country, while Canada and America were called upon to assist.

In October, 1914, a Committee of the Cabinet was formed to assist the War Office in obtaining the necessary supplies. The Committee considered that the best plan was to call upon the English armament firms to produce a much larger quantity than that already arranged. Representatives of the firms came before the Committee, were given the necessary orders, were told that they might rely on having *carte blanche* for setting up plant and new buildings, that they had a free hand as regards cash, that the Government would indemnify them for all costs and give liberal profits. The firms undertook to try and accelerate the supply of field guns (this being taken by the Committee as an example)—but pointed out the difficulties with which they were hampered.

The same procedure was followed in the case of other accessories.

It should be mentioned that, from the earliest date, full permission was given to the firms to place sub-contracts with non-armament firms for components which they were capable of manufacturing. The orders (about October, 1914) placed in England involved the employment of some 2,500 to 3,000 firms in the production, either in the form of direct contractors or sub-contractors and many of these firms had had no previous experience in the particular work.

Now to turn to the reasons of inability to supply up to our needs and orders.

At the outset, never for one moment have I ever denied the fact that during the early days of the War, the expeditionary forces in France and other theatres of war were very short of the guns, machine guns and ammunition which experience in the first few weeks proved to be necessary.

The inability of the armament firms to fulfil their promises may be attributed briefly to:—

(1) Shortage of labour, especially skilled labour. It will be remembered that Lord Kitchener's demand for men for the Army was very urgent and met with a grand response with the result that the supply of men for manufacturing purposes was gradually and continually depleted.

(2) Delays in delivery of machinery, due firstly to the fact that the whole world was calling for machinery, especially from America, and secondly owing to delays in land and sea transport. Often it took 60 instead of 20 days for goods to come from America, while railways and docks were so congested that even transit from Liverpool to London sometimes occupied five weeks.

(3) The difficulty in provision of gauges. The craft of gauge making is limited and with many new firms making munitions, the demand for gauges was enormous. In some fuses nearly 200 gauges are required and in making, say, 10,000 fuses a week, some 1,300 sets would be required.

(4) Trades Unions restrictions such as, for instance:—

(a) The prohibition of unskilled or semi-skilled men doing the work of skilled men.

(b) The prohibition of women doing work wherever possible.

(c) The limitation of one man to one machine.

(d) The limitation of a man's output.

(e) The prohibition of union men working with non-union men or doing work which had been dealt with in any stage by non-union men.

Many employers stated that if the restrictions of the Associated Society of Engineers in particular, were removed, the output would at once have been increased by 25 per cent.

In February, 1915, additional powers under the Defence of the Realm Act in order to deal with these restrictions, strikes and other matters were put

forward at my request in a proposed Bill but they were struck out by the Government—why, it is not known—but they were all practically included in the Munitions Act of July, 1915—after the Ministry of Munitions had been formed. Notwithstanding this, I find a note, made at the time, that on 1st January, 1916, the Prime Minister and Mr. Lloyd George were still begging for restrictions to be removed.

Not wishing to make this statement unduly long I add the following brief remarks which seem to bear on the matter before the Commission:—

A. In peace time the manufacture of the time and percussion fuze used with the field guns was limited to 60,000 a year and yet I called upon the Ordnance Factories and the firms to produce 1,500,000 by April, 1915. I quote this as one example of the increase of plant and buildings required at short notice.

B. There was never any shortage of shell—any number of firms could make them but the supply of fuzes and propellants was much more difficult. Early in December, 1914, Sir George Gibb and Lord Pirrie told me they were sure they could find many firms capable of making time and percussion fuzes; but at the end of a week they told me they had found that they were wrong and Sir George Gibb placed the additional orders with the same original firms.

C. The Ordnance Factories and armament firms, notwithstanding their output in the first 10 months had increased upwards of 150-fold, were criticised for their delays; but it is only fair to them to say that with all the advantages held by the Ministry of Munitions it was 11 months before the first complete round manufactured to their orders was available.

D. When comparing prices, it is important to obtain full details. For example, in many cases, the War Office contract branch undertook to pay a higher price to cover the cost of the new buildings and plant required to execute the order. When this extra cost had been met the price was automatically reduced.

My recollection of the Lewis gun is that we paid about £140 a gun for the early deliveries and this was afterwards reduced to £80 when the cost of two large new shops and their equipment had been met; but it would be untrue to say that the actual contract price of the gun had been reduced.

In conclusion, I wish to inform the members of the Royal Commission that, in my opinion, the Empire owes a great debt of gratitude to the English armament firms as well as to the Ordnance Factories for all they did during the War to overcome the great difficulties experienced by them in meeting our demands. I was personally almost daily in touch with the late Sir Trevor Dawson, Mr. Saxton Noble and the heads of the other big firms and I am convinced that they did everything in their power to help in this great work. The inability to punctually meet our demands was entirely due to circumstances beyond their control.

If I may be permitted to offer any remarks on the desirability of the continuance of the principal armament firms, I would point out that we should fare very badly if we had not their resources in buildings, machinery and skilled labour to depend upon, but I should also like to emphasise the advantages we have always derived from their excellent design branches. The state factories were always hampered by not having any money allotted to them for experiments, whereas the private firms were not only ready to spend money on experiments but they maintained a designing staff paid at much higher rates than would ever be sanctioned by the Treasury.

Moreover the private manufacturer has his wits continually sharpened by competition. He is always up against other designs which may be better than his own and against cheaper forms of manufacture; cost of production does not influence the designer in

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

state-run works to the same extent. In the matter of designs we obtained most valuable help from Armstrongs and Vickers before, and particularly during, the War. Practically all the new guns, howitzers and mountings which were introduced in the course of the War were to designs supplied by one firm or the other, while I can call to mind instances where, with the aid of their designing staff, we were able to overcome various difficulties which arose owing to the unprecedented wear and tear of guns and their appliances.

I mention some of the new patterns of ordnance to which I have referred: 3·7 inch Q.F. Howitzer; 60 pr. B.L. Gun, Mark II; 6-inch B.L. Howitzer; 6-inch B.L. Gun, Mark XIX; 8-inch B.L. Howitzer; 9·2-inch B.L. Howitzer; 12-inch B.L. Howitzer; 9·2-inch B.L. Gun, Mark XIV; 12-inch B.L. Gun; 14-inch B.L. Gun.

That concludes my statement. I picked out one or two points in Dr. Addison's evidence that I could speak to. Would you like me to take those now or wait till I have been asked any questions on them? 1226. *Chairman*: Perhaps you had better indicate what it is.

Sir Stanley von Donop: As I say, I have had only a very short time to go through them, but he states that early in 1915 our methods of giving orders to expand the armament firms showed difficulties, and so they had to start national factories. He says that was in May, 1915. I was at a big meeting on the 23rd July, 1915, at the Ministry of Munitions and a large order for guns and carriages had come in and the matter was discussed as to how they should be supplied. This Committee of the Ministry of Munitions unanimously followed the same procedure that we had followed, although Dr. Addison says they had to start national factories. They did afterwards, but they confirmed entirely what we had said.

1227. *Sir Thomas Allen*: At that point.

Sir Stanley von Donop: Yes, in July, 1915, because when I went back to Lord Kitchener after the meeting he asked what had happened, and when I told him he burst out laughing and said "This is what you have been abused for by the Cabinet every single day since the commencement of the War for doing and now they have done the same thing."

1228. *Sir Thomas Allen*: That was the opinion of the Committee at that particular moment, with their knowledge and experience?

Sir Stanley von Donop: I do not think they had any at that moment. They were all new. They did not know a gun from a howitzer.

1229. *Sir Thomas Allen*: They had to rely on the old system for the time being, until they had proved something better?

Sir Stanley von Donop: I suppose so, until they had developed something better. Then Dr. Addison said the deliveries from national factories began in August, 1915. The first completed round was sent in in April, 1916. They produced what Mr. Lloyd George called "a lot of empty mugs." He was alluding to shells. He merely meant they were empty shells. They had no components. And an empty shell was no use. When the Ministry was first formed they asked me what we wanted particularly, and I gave them a list in the order of precedence of difficulty in getting them. At the end of a month they had not ordered a single thing except the simple shell that anybody could make, and that was the cause of their being unable to produce a complete round for 11 months after the order had been given.

Then the Ministry claimed a reduction of prices. I have already mentioned the facts about the prices. You must remember that in October, 1914, there was a Cabinet meeting at the War Office when the representatives of the firms were brought there and they were given *carte blanche* as to money, as to

anything they liked to spend. That helped them a little bit in their arguments with our Contracts Branch, when they were dealing with prices.

Then Dr. Addison said that Woolwich lived up to promises and the firms did not. Woolwich had not the same opportunities of expansion. The firms could not foresee the difficulties that I have mentioned in my memorandum about the supply of machinery and transport, and I may say the firms did not promise that Cabinet Committee to produce that large number of guns. They said they would do their very best to produce it. Mr. Saxton Noble came to me next morning and said, "We have accepted the wish of the Cabinet Committee to increase the number of guns; that we have promised and we will do our best, but mind you, we are not going to be pilloried because we have not done it, because it is outside our actual work."

1230. *Chairman*: Dr. Addison spoke about the contracts made and about deliveries not being made in accordance with contract time. Were there in fact any written contracts entered into or was it merely an order given and an indication that the firm would do its best?

Sir Stanley von Donop: There were actually written contracts which stipulated the time, based on what we hoped they would be able to do, but I admit none of them were able to keep up to their promise, because of these difficulties I have mentioned. Nobody realised the difficulties.

1231. *Chairman*: There was a fixed time?

Sir Stanley von Donop: Yes, in nearly all the contracts there was a fixed time. I noticed a member of your Commission talked about not being able to get the soldiers to decide between shrapnel and high explosive. I do not know whether you want me to enter upon that. I do not know whether it concerns the Commission or not, but I have a very good answer.

1232. *Professor Gutteridge*: I should like to hear that.

Sir Stanley von Donop: I will try and put it as shortly as I can. The accusation was that we would not admit the necessity of high explosive shrapnel for field guns and that Lord Kitchener was prejudiced against it. I can tell you at once that Lord Kitchener took the keenest interest in what we were doing, but I never heard him express an opinion on the subject. He did not mention it in any way. But before the War, when the 18-pounder equipment was being made, the question of high explosive shells for the destruction of shielded guns was very closely discussed. At the moment I was Superintendent of Experiments carrying out trials and we were going to carry out a trial against shielded guns with high explosive shell and shrapnel. The Ordnance factories could not produce a fuse which was safe for our high explosive shell, and so the work was delayed. But one day when I was carrying out experiments against a screen I missed the screen and hit the shield with the shrapnel and the whole of the dummies and everything else behind the shield were smashed to smithereens. I wrote up to the Ordnance Committee stating that I had not been able to carry out the whole of the experiment but I had carried out half of it, and they replied that shrapnel was good enough for the gun and they very carefully went into the question of whether field guns were to be supplied with high explosive as well as shrapnel, and the General Staff, and everybody connected with the Ordnance Committee, and others, came to the unanimous opinion that field guns should not be provided with high explosive but only with shrapnel.

1233. *Sir Philip Gibbs*: I think there was a mistake.

Sir Stanley von Donop: A mistake in what they said?

1234. *Sir Philip Gibbs*: Yes.

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

Sir Stanley von Donop: Very likely. I do not want it to be used in any way to pillory, but Sir Douglas Haig was Director of Military Training. His were the words I have quoted, that it was absolutely unnecessary to have high explosive for the guns. I only wish to say that it was considered very closely before the War. It was not overlooked. Directly the War started—I am afraid I am going to be a little egotistical; I do not want to be, but I cannot help it—I did, on my own initiative, write to the Commander of the Artillery of our Expeditionary Force and say "It seems to me from what I hear that you are getting a lot of damage from the German high explosive field gun shells. Would you like me to provide some high explosive shells for your field guns?" He wrote back "As an advance opinion I should say that if you really have safe explosives for field guns, by all means proceed to manufacture. Our gunners would certainly like to be in possession of it, and I suppose money is but little object, and it will take a considerable time to supply, will it not?" Next he sent me a letter on the 7th September, 1914—"I got the ear of the staff concerning the high explosive for field artillery and they do not seem to think that we have quite enough data to go upon. I have not got the Chief's ear, but Murray"—that is, the Chief of Staff—"is in favour of you at home getting on with the matter, as in all probability it will be welcomed in the long run, and I certainly think that our people (gunners) will be happier when they are in possession of it. The moral effect of the stuff is no doubt high, though the actual effect does not seem to come up to statements."

1235. *Professor Gutteridge:* High explosives were very local in their effect at that time?

Sir Stanley von Donop: Yes, and also it was found that high explosive shell is very much better with a gun of a larger nature rather than of a smaller nature, such as the 18-pounder. We went on with it afterwards, but it caused a certain amount of trouble to start with, because I could not find out whether they wanted it or not. If they wanted it we had to start manufacturing on a large scale and the question was whether if we manufactured on a large scale it would hamper the supply of shrapnel, which was very important. We had to place additional orders, and eventually we supplied the high explosive. I think that is everything that I have to tell you.

1236. *Chairman:* There is a passage in Lord Cecil's evidence that I will read to you and I will ask you what you have to say about that, because I do not quite understand what he says. It is on page 13 of Lord Cecil's evidence, in the first column. He says:

"The Government found that they required immensely more armaments than they had anticipated—than anybody had anticipated, when they saw the kind of numbers that were engaged in the War—and the official provision for it was, of course, quite insufficient. They then turned, in the first instance, to the various armaments manufacturers, and gave orders for various things. I am speaking out of my own recollection, which may be inaccurate. They found"—

that is, the Government—

"that in point of fact the armaments manufacturers combined to pool their own resources—that they were unable to act independently—so that in fact the Government only got one additional source and that at a very considerable price."

From your experience, what do you say with reference to that statement that they had pooled their resources and acted as one?

Sir Stanley von Donop: I do not think there is any truth in the matter. I was always giving orders separately to each of the firms and I can only say that we gave the firms permission to expand to any extent they liked and to place any number of sub-contracts—that is to say, to pass on

to the non-armament firms things that they were capable of making, so as to relieve them from making those components. The result was that we had between 2,500 and 3,000 other firms combining to help with various components, but they were chiefly farmed out by the armament firms. We gave an order, for instance, to the Elswick Ordnance Company for gun ammunition and so on, with full permission to sub-contract, and they distributed a lot of the components to those small firms.

1237. *Chairman:* Yes, but as far as you were concerned, had you any evidence that these firms were not acting independently?

Sir Stanley von Donop: No; none at all.

1238. *Chairman:* Or that they had pooled their resources in order to raise prices?

Sir Stanley von Donop: Oh! no; not in the very least. I had a very good financial expert on my staff and the only complaint I ever had from firms was that this man was trying to skin them down to the very lowest prices. Of course I was a little bit hampered in a way by Mr. Lloyd George. There was a Cabinet meeting—well, it was not a Cabinet meeting, I suppose, because I was there—but a special meeting of a number of Cabinet Ministers. We met in Lord Kitchener's room, and these firms were represented and were given *carte blanche* to do anything they liked and were told that they would not be hampered for money or anything like that. That tied our hands a little bit when we were arranging terms; but I have not a word to say against the way the firms met us.

1239. *Chairman:* Would you mind turning to page 118 of the Appendix to Dr. Addison's evidence? Dr. Addison made a great point of this, I think. He said that it was essential that in peacetime some organisation should be set up which would be capable, in the event of an emergency, of utilising every available machine and every available man to the best advantage. He said that that organisation should be set up in peacetime, to render that possible. Do you agree with that as a matter of precaution, of wise organisation?

Sir Stanley von Donop: I do not think it can fail to help matters.

1240. *Chairman:* If you turn to page 118 you will find, under paragraph 72, in the left-hand column, the various reasons that Dr. Addison gives for that general conclusion of his. I should like to go through them with you to see how far you agree with them, or, if you do not agree with them, why you do not. What he says is this:

"There should, I suggest, be a single supply and manufacturing department for all war departments, the following being some of the more prominent considerations:—(1) There were numerous instances of the difficulties, and sometimes waste, which arose out of different service departments seeking to obtain the same materials as well as machinery at the same time. Because of those difficulties the supply of materials and machinery became progressively concentrated in the Ministry of Munitions. The advantages of unified responsibility are manifest, where imported supplies are concerned."

Do you agree with that?

Sir Stanley von Donop: I quite agree that everything that is done to avoid overlapping and competing against each other is a good thing. I was in trouble once because a lot of the artificers at one of the famous firms in—I forget whether it was Birmingham or Sheffield—were bribed to go up to the torpedo factory at Greenock. I went to Lord Kitchener and said: "They have been given double pay to go there." He said: "Give them treble pay to stay here." Anything to prevent competition between firms is a good thing.

1241. *Secretary:* It may be within Sir Stanley's knowledge that since that time there has been set up a Contracts Co-ordinating Committee, which co-ordinates Departmental demands for supplies.

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

Sir Stanley von Donop: Then that meets the case. I have been out of it for 15 years, so I am not in touch with what is going on.

1242. Chairman: Will you turn to the top of the next column?

"(2) The disorder and possible waste and loss to the efficiency of supply are equally cogent in the case of manufacture either in national establishments or by private firms. The overlapping of orders and divided responsibility in the case of aircraft supplies is a striking example."

That is really only a continuation of the same argument?

Sir Stanley von Donop: Yes.

1243. Chairman:

"(3) Similarly great economies as well as improvements in manufacturing efficiency are obtainable through a costings system under unified and experienced direction. The difficulties that arose between the Ministry of Munitions and the Admiralty over cordite prices, of which details can be supplied if desired, furnish an illustration of the losses that may arise from divided responsibility."

Do you agree with that?

Sir Stanley von Donop: I have no doubt that a combine working together could agree to keep the prices down and not to be competing, as it were, against each other.

1244. Chairman:

"(4) The processes of transport, assembly, inspection and filling are those in which unless there is unity of direction there must be unnecessary delays and disorder."

Sir Stanley von Donop: That is a platitude, I think.

1245. Chairman:

"(5) The work of design and experimentation is inseparably associated with that of manufacture and supply, and, as the evidence has shown, serious difficulties and delays occurred during the first year of the work of the Ministry of Munitions, because design had not been associated at the start. The records of the Inventions Department of the Ministry (which can be supplied if desired) are a good example of how an alert central department can be directed to make use of and develop not only the suggestions of its own experts but those which come from outside. The cases in which this department assisted to bring up to a workable form suggestions often of quite humble people were very numerous. There were some thousands of cases great and small. It is certain that had it not been for these arrangements very many useful ideas would never have been made use of. The case of tanks referred to by Sir Eustace D'Eyncourt—who was himself the chief designer in the Admiralty—is an example of how a central department (the Ministry of Munitions was responsible for tank supply) was able to make use of and provide facilities for the development and perfection of outside suggestions. The Stokes mortar is another example."

Do you agree with that?

Sir Stanley von Donop: It is a very nice pat on his own back for what they did at the Ministry of Munitions, but I am not prepared to say that the War Office were not equally capable of doing what they did in the way of inventions. For instance, we were working on the tank as well, and I know that when we came back from the first trial of the tank down at Hatfield, Lord Kitchener said to me: "Would you like to be responsible for the manufacture of those tanks or would you like the Ministry of Munitions to do it?" I said: "I should let the Ministry of Munitions do it. They have been working at it and I do not want to interfere with them in any way. But we have got the matter in hand ourselves as well." I do not think there is very much in what he says, because it only means, putting it rather bluntly, that their

design branch, or their experimental branch, was better than ours, or that their invention branch was better than ours.

1246. Sir Philip Gibbs: I think his point was that by having an Inventions Board you would get design just as well under a national system, as you would under private manufacture. It not that rather the point?

Sir Stanley von Donop: Yes; but I had one department under me at the War Office which dealt with inventions, and people came there with inventions—and very good ones some of them were—and we had to differentiate between them.

1247. Sir Philip Gibbs: You did not rely entirely on the designs of private firms.

Sir Stanley von Donop: Oh! no. Lots of inventors came to this Board. With regard to this particular tank: It was a curious case. Sir Maurice Hankey telephoned me from his office one day to say a man was there with a wonderful invention and would I let him come and show it to me. He told me roughly what it was, and I said "The Admiralty are dealing with that at the moment"—Mr. Winston Churchill, I think it was, at that time had taken it up—and it is no use everybody putting their fingers into it". I said, "Can you arrange with the Admiralty to see it, and I will go over there?" I went over there in the afternoon; the man had arrived and he had produced a little model of the tank which we had already got—it was a case of two great minds thinking alike—and the only means we had of saving ourselves—we had not made the tank—was by at once sending for the designs of the tank at the Admiralty and producing them to this man to convince him that we had not stolen his design.

1248. Chairman: What Dr. Addison was emphasising was, that you would not be, in a case of emergency, running about between the various departments to see which should take up a particular thing, but that there should be a central department working for all branches of armament work?

Sir Stanley von Donop: We had that. I had a department under me dealing with that at the War Office. They dealt with all inventions that came in.

1249. Professor Gutteridge: But the Admiralty had a separate department.

Sir Stanley von Donop: The Admiralty had a separate department. That was for the sea. We did not clash with them. One was for the land and the other for the sea.

1250. Professor Gutteridge: The Air people had their own?

Sir Stanley von Donop: The Air people had their own.

1251. Chairman: If we may finish what I was asking you about, will you refer again to what Dr. Addison said?

"(6) There is a final and most important reason for the existence of such central department as is here suggested, namely, that only by such an agency would it be possible to mobilise and secure the rapid utilisation of appropriate private manufacturing capacities to provide expansion in the case of war. This consideration calls for suggestions as to how such a department would operate."

You see, what Dr. Addison visualises is a central department which should be able, as he says, to mobilise and secure the rapid utilisation of appropriate private manufacturing capacities in case of emergency. If something of that kind were set up in peace time it would avoid a great many of the difficulties and troubles that were experienced at the beginning of the Great War, would it not?

Sir Stanley von Donop: It would to a large extent; but the great difficulty was to get the machinery. To follow that out to the end you would have to lay-up and store machinery, you would have to have it installed ready for the purpose. There

10 October, 1935.] Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

was one firm making "Nota Bene" pens or something of that sort; we turned them all on to it; we had between 2,500 and 3,000 other firms all working very shortly after the commencement of the War, firms that had had nothing whatever to do with munitions. To-day what you suggest, Sir, would mean that some particular place should have all the machinery necessary for carrying out this work of making armaments.

1252. *Chairman*: You could have an organisation with a register of all possible available factories?

Sir Stanley von Donop: Yes.

1253. *Chairman*: You could have that all ready?

Sir Stanley von Donop: Yes. There is no reason why you should not have a census.

1254. *Chairman*: You had not got it in the last War?

Sir Stanley von Donop: No.

1255. *Chairman*: Because you had no organisation that was able to do that particular work?

Sir Stanley von Donop: No. The only thing is, that without organisation, in a very short time we had picked up between 2,500 and 3,000 firms to help the armament firms in supplying components.

1256. *Chairman*: When you speak of "a very short time", it was several months?

Sir Stanley von Donop: I think it was in October. Of course, in the first months of the War nobody realised the enormous demands we should be called upon to meet. While you are talking about the supply it would be just as well for me to say that not only all those nations engaged in the War found that they were expending very much more ammunition per gun or per division, or whatever it was, than had been expected—and most of the nations had only to increase the number per division to meet the demand—but we also had to meet that extraordinary increase that was required when Lord Kitchener increased our Army from seven to seventy divisions. And that is what I may say almost broke us.

1257. *Professor Gutteridge*: The sudden increase in the armed forces?

Sir Stanley von Donop: The sudden increase. Not so much the gun increase, but the divisions themselves increased tenfold. That was a great burden on our shoulders.

1258. *Professor Gutteridge*: The previous estimates of ammunition expenditure were based on the Russo-Japanese War, were they not?

Sir Stanley von Donop: I do not think so. The history of it is that a certain amount was laid down and Sir Henry Brackenbury, when Director-General of Ordnance, insisted on a very large increase in the reserve, and the Prime Minister at the time said he was not able to do it without a Special Committee on the subject. A Special Committee dealt with it. I cannot quite remember the figures; twelve million pounds came into it, but the Committee said he had asked for too much, eleven and a half million would do it.

1259. *Professor Gutteridge*: At any rate, the calculation was made according to the data then available?

Sir Stanley von Donop: Yes.

1260. *Mr. Spender*: Had the French at the time any arrangements for expanding?

Sir Stanley von Donop: I could not tell you. I know they took on a lot of extra firms like we did, because a certain gentleman came over and told me about it, and I said "All right!" Then he went to Lord Kitchener about it, and Lord Kitchener referred to me, and I said we had had done the same. Then I had a letter from Buckingham Palace saying that His Majesty had heard what splendid work had been done in France in expanding to civilian firms. Then I thought it was time to turn, and I wrote a letter showing that we had taken on something between 2,500 and 3,000 firms to help

in expanding the supply of ammunition. Finally, the gentleman who had come over here to give us that information wrote me an ample apology and said he was very sorry indeed he had raised the question.

1261. *Sir Kenneth Lee*: I am not sure whether you answered one of the questions which the Chairman put to you with full knowledge of what Dr. Addison had in mind. In paragraph 72 of Dr. Addison's memorandum he says: "There should, I suggest, be a single supply and manufacturing department for all war departments."

Sir Stanley von Donop: Does that mean that you are to limit it to one (we will call it) ordnance factory and have no private firms?

Chairman: I think so.

1262. *Sir Kenneth Lee*: Dr. Addison's idea, I believe, was that there should be a single department controlling all war supplies.

Sir Stanley von Donop: A department controlling; not manufacturing?

1263. *Sir Kenneth Lee*: Controlling.

Sir Stanley von Donop: In other words, that the Admiralty, the Air Force and the Army should work under one control?

Sir Kenneth Lee: Yes.

1264. *Chairman*: He deals with two separate things—one is control, the other is manufacture.

Sir Kenneth Lee: Yes.

Sir Stanley von Donop: If you can get all three Forces, the Army, the Navy and the Air Force, to work together for control, well and good—I think it is a very good thing not to be competing with each other, as we sometimes had to do—but as to putting all the manufacture under one control, I think that would be wrong. I think if Government manufacture were the only manufacture allowed in England it would lead to dire consequences.

1265. *Sir Kenneth Lee*: Would you think that one supply department would be desirable for the Navy, the Army and the Air Force?

Sir Stanley von Donop: I should not think it was necessary or desirable. I think it would rather hamper matters. We very seldom worked across, and sometimes when we did work across we arranged between ourselves. The subject of cordite was one thing. Both the Navy and the Army were dependent on cordite. On the Saturday before war was declared, Mr. Asquith being then Secretary of State for War, I went to him and asked him if I could place orders for munitions, including cordite. He said "No." Lord Haldane came into the War Office temporarily as Secretary of State for War—I think it was on the Tuesday—and I went and asked him the same question. He said "Yes." But when I went to place orders with the cordite firms they said, "We cannot take any more orders. Mr. Winston Churchill, the First Lord of the Admiralty, took up the whole of our supply on Saturday morning." That was the day I saw Mr. Asquith. That was very easily settled. I went to the Admiralty and they agreed it was no use their taking the whole, we must have some, and we arranged it amicably between us.

1266. *Chairman*: It was a happy accident that you were able to arrange it?

Sir Stanley von Donop: Yes, I daresay it was.

1267. *Sir Kenneth Lee*: One supply department would avoid that?

Sir Stanley von Donop: Yes.

1268. *Sir Kenneth Lee*: Is not the supply in war time of automatic machinery and machine tools of very great consequence?

Sir Stanley von Donop: Yes. I think it would help to have some arrangement in that way.

1269. *Mr. Spender*: Your general view of this subject is that the combination of the state with private manufacture, with the necessary improvements gathered from experience in the last war, meets the case.

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

Sir Stanley von Donop: Yes. I think it meets the case better than having one single government manufacture.

1270. *Mr. Spender:* Of course, there has been another view expressed.

Sir Stanley von Donop: No doubt.

1271. *Mr. Spender:* It has not been put before us because we have heard only one side of the case, but there is a view which is known to the public—that is that the private manufacturers and the armament firms were obstructed by slow moving official machinery.

Sir Stanley von Donop: I do not quite understand.

1272. *Mr. Spender:* The criticism of the official world and the official mind was embodied in Mr. Lloyd George's book.

Sir Stanley von Donop: That we hampered them?

1273. *Mr. Spender:* Yes.

Sir Stanley von Donop: I am prepared to defend any case they bring before me on the subject. I think if you asked the armament firms they would say they received every assistance and encouragement from us in every way. We never hampered them in any way. I should like to hear an example.

1274. *Mr. Spender:* It was said that there were great masses of shells waiting to be filled and that the difficulty arose in the official departments.

Sir Stanley von Donop: And did the same man state that there were plenty of fuses and cartridges to go to those shells?

1275. *Mr. Spender:* I think he was more cautious.

Sir Stanley von Donop: I daresay he was. There were millions of shells lying all over the place. Anybody could make the shells, but to get the fuses and propellants was quite a different matter.

1276. *Mr. Spender:* You would say, General, that when we got into the second and third years of the War the British output was very efficient, would you not?

Sir Stanley von Donop: Yes, it was.

1277. *Mr. Spender:* I remember being told in 1916 by the French that the British 9 inch howitzer was better than any other gun on the side of the Allies.

Sir Stanley von Donop: I am very glad to hear it. We had a high opinion of that 9.2 howitzer, the one you see on the Hyde Park Memorial.

Mr. Spender: M. Clemenceau was anxious to get a large supply for the French army.

1278. *Professor Gutteridge:* The 60 pounder enjoyed high repute too.

Sir Stanley von Donop: Yes, the 60 pounder was a very good gun.

1279. *Sir Philip Gibbs:* Would you consider that our system of state manufacture, like the Royal Arsenal, and reliance on a few private firms, was built up at a time when we looked only to small expeditionary forces and small Colonial wars? Would you agree to that?

Sir Stanley von Donop: The system was built up at that time.

1280. *Sir Philip Gibbs:* And that, therefore, when we were faced by a world war, of course, that system was inadequate at that moment when we were taken by surprise and there was necessity for a large increase in everything.

Sir Stanley von Donop: By Lord Kitchener making a large army, you mean?

1281. *Sir Philip Gibbs:* Yes.

Sir Stanley von Donop: Yes. Quite so.

1282. *Sir Philip Gibbs:* And you really agree that that system was actually inadequate to a big war?

Sir Stanley von Donop: At that time; oh! yes, we could not supply what was wanted.

1283. *Sir Philip Gibbs:* You go on to point out several times that you had to extend the supply by going to a great number of private firms.

Sir Stanley von Donop: Yes.

1284. *Sir Philip Gibbs:* Therefore, it is an admission that the private manufacturers were not in themselves sufficient to increase their supplies. That is so, is it not?

Sir Stanley von Donop: You mean the ordnance firms, like Armstrongs and Vickers?

1285. *Sir Philip Gibbs:* Yes, and their powers were not sufficient really to cope with this immense increase?

Sir Stanley von Donop: No; not without enlarging and diverting a number of their sub-orders to those other firms that they took on which were capable of doing the smaller things—the components.

1286. *Sir Philip Gibbs:* Arising out of that point, did you have any connection at all with the Committee of Inquiry into the Royal Ordnance Factories at the end of the War?

Sir Stanley von Donop: No.

1287. *Sir Philip Gibbs:* As Master General of the Ordnance, I should have thought you would have been consulted.

Sir Stanley von Donop: No. I was out of the Army. I left the Army in February, 1920. I do not know when that took place, but I was never asked to go to it.

1288. *Sir Philip Gibbs:* There is an interesting sentence in the Second Interim Report presented to the Government. The Committee consisted of a certain number of rather high experts like Admiral Bacon, General Furse and so on. It was not a lay Committee. I should like to read you this sentence from the Report of the Committee of Inquiry and I should like to hear your views upon it. It says

"The magnitude of present day war operations is such that the reserve of manufacture in peace time for war development cannot be looked on as being concentrated in the Government Arsenal and two or three particular firms. The real reserve for war is the whole of the manufacturing power of the country."

That is an important statement by a number of high experts. It rather bears out the contention of people like Dr. Addison that the present system of relying on the Royal Ordnance Factories and a few specialist firms is not really sufficient if we are suddenly confronted with an important war, and that some other system might, with advantage, be adopted—not necessarily nationalisation, but control like that of the Ministry of Munitions, organising in peace time the whole of the private engineering power of the country. Would you agree with that? It raises a very large question.

Sir Stanley von Donop: Yes; it raises a very large question and I doubt the practicability of it unless you are going to set up an enormous factory and machinery. A firm that is making pens will not make shells. You must have machinery ready for the supply of the particular war munitions.

1289. *Sir Philip Gibbs:* Would it be sufficient to have gauges and models and specifications?

Sir Stanley von Donop: To a certain extent; but then you have to get the machinery. The trouble in increasing the supply was this, as the armament firms told that Cabinet Committee that I was mentioning. They said: "We will endeavour to meet your enormously increased demands," but they found the whole world was out for machinery. They had to send to America to get it and everybody else was sending to America and they could not get the machinery. I gather your idea is to have it all ready to expand?

1290. *Sir Philip Gibbs:* To have the plan of the system ready.

Sir Stanley von Donop: But you have to have all the machinery as well. You have to have all the lathes and machinery necessary for making these munitions. As things develop, patterns of guns, patterns of shells, patterns of fuses, all change; and if you have the gauges for one lot,

10 October, 1935.] Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

they are scrapped, and you have to get fresh gauges for the others.

1291. *Sir Philip Gibbs*: Some of our witnesses have emphasised the point that an ordinary engineering firm can very often readily adapt itself to the making of armaments.

Sir Stanley von Donop: I know. They said that during the War. One or two came to me and said, "Can we not do something?" I asked, "Can you do this, that and the other thing?" and they said, "Yes, we can easily adapt it." But, shortly afterwards, they came to us and said, "Will you release us from the contract?" Some of the things are easy, but some upon which the supply of a round of ammunition depends are very difficult, such as fuses and so on, and you can only get experts to do it.

1292. *Sir Philip Gibbs*: You said that when it was necessary to have an increase in the fuses the War Office found they had to go to firms which had previously been making them and that they failed in their endeavour to get other firms to make fuses. Were the fuses actually made by other firms at a later date?

Sir Stanley von Donop: I cannot answer that off-hand, but I will say this, that, later on, they did get a simplified form of fuse that was easier to make. With reference to that, I would tell you that Sir George Gihb came to see me. He was brought into the War Office to help with the supply of armaments. I told him the trouble about fuses. He said, "Why? General, any good firm could manufacture a fuse like that." I said, "Go and get me a firm who will do it." Off he went and he came back a few days afterwards with Lord Pirrie. They both entered my room and they both said, "It is absurd of you to say that no good engineering firm can make this fuse." I said, "Here are six fuses. Go off and come back when you have placed the orders." They said, "We can do that quite easily. Any firm can make them. You do not know what you are talking about." Off they went and in a week's time they came back and said, "General, you are quite right, not a single firm in England can make it."

1293. *Sir Philip Gibbs*: Could it have been simplified?

Sir Stanley von Donop: We simplified some of the fuses and made it easier, but even with a well-known firm like the Coventry Ordnance Works, we found the greatest difficulty in getting fuses to pass proof.

1294. *Professor Gutteridge*: Is it not largely a question of labour? It requires a very skilled man, does it not?

Sir Stanley von Donop: Sometimes it requires a skilled man. The Coventry Ordnance Works were making a particular fuse. At the Arsenal we were getting them all right and we told them to go there and they would be shown everything. They went to the Arsenal and were shown everything and they said "Yes, we are doing it in exactly the same way." They had a lot of conversation at the Arsenal and they found that the only difference between the way they were making the fuses and the way the Arsenal was making them was that a little piece of some vegetable paper was put in between the two rings of the fuse. The Arsenal people said "Take your vegetable paper away and try our paper," and the whole thing worked at once. It turned on the peculiar ingredient of the little bit of vegetable paper. It is very technical work.

1295. *Sir Philip Gibbs*: You also said in your statement that, in employing private firms, the War Office allowed them to sub-contract a great deal of work.

Sir Stanley von Donop: Yes.

1296. *Sir Philip Gibbs*: But Dr. Addison made a very strong point that that sub-contracting failed and that it was found necessary afterwards to cancel the sub-contracts and to have direct contracts. Do you hear that out?

Sir Stanley von Donop: No; not at all, because the Ordnance Factories and the big firms placed an enormous number of sub-contracts. That was what I was referring to when I mentioned the 2,500-3,000 firms all helping. They were mostly sub-contracts from the contracts placed with the big firms.

1297. *Sir Philip Gibbs*: Dr. Addison said that when he was Minister of Munitions he found that the whole of the system failed, partly on account of labour trouble, that the firms dealing with sub-contracts felt that they would rather deal directly with the government.

Sir Stanley von Donop: I think there is a certain amount of truth in that. What it meant was that, in the early stages of the War, many of the trades of the country stopped and, therefore, there were crowds of firms only too ready to take on work, and they took on these contracts. Then, as the War progressed, they said to themselves "Why should not we get the contracts instead of only taking sub-contracts from big firms?" They made that point and that was the reason why the smaller firms began to object to it; but they were only too glad to have it in the early days. It was a pure case of pounds, shillings and pence. They thought the big firms were making more money than they were making themselves and they wanted to be the people who were making it. I do not think it was a question of failure to do it. It was only a question of who was to get the most money.

1298. *Sir Philip Gibbs*: It seems to me that, in your defence of the private firm, you have done less than justice to the Royal Arsenal. You have not said—I think it would be rather interesting to know—what place in the scheme of armament provision is played by the Royal Arsenal. As Master General of the Ordnance, it seems to me that it would be very interesting for us to hear what you consider is the definite place of the Royal Arsenal in our defence scheme.

Sir Stanley von Donop: To begin with, shall I talk about peace time?

1299. *Sir Philip Gibbs*: Yes.

Sir Stanley von Donop: In peace time we want to keep the Arsenal going with a certain proportion of orders; we want to keep a good nucleus of machinery and men and foremen and experts.

1300. *Sir Philip Gibbs*: Is there any necessary limitation to that? Could not that be extended?

Sir Stanley von Donop: It is only a case of pounds, shillings and pence. The grant to the Arsenal in Parliamentary Papers is £100 a year. The expense of everything that is made at the Arsenal has to be met out of the price of the manufactured article. The whole of the employment at the Arsenal has to be paid for. The buildings, staff and everything else have to be paid for by the price of what they produce for war. Everything is priced at a certain amount.

1301. *Sir Thomas Allen*: A contract price?

Sir Stanley von Donop: No. It is not a contract price. They are called upon to supply a certain number of war material things and they have to do it without its costing a penny. They produce it and then they charge against it so much as the price of the shell or the gun, or whatever it is. That goes towards paying their staff. It has to be what you call a self-supporting house.

1302. *Sir Philip Gibbs*: What is really working in my mind is this. Would it be possible to increase the importance and authority and the manufacturing supply of the Arsenal and then to organise the entire engineering power of the country under the authority of the Royal Arsenal? Do you think any system like that would be possible, cutting out reliance on the expert manufacturer?

Sir Stanley von Donop: No, I do not think that would be advisable. To begin with, we placed as large orders as we could down at the Arsenal to keep a certain number of men in employment.

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

Let us call the number of men 10,000; it was cut down to 10,000 at one stage, and we had to give them sufficient orders to be produced, and the price of which would meet the pay of the 10,000 men. Then, having done that, we distributed other orders to the armament firms such as Vickers and Armstrongs to keep them going. If you concentrated everything in the Arsenal, the first thing is that you would have to pay an enormous amount, and the second thing is that the other armament firms would go out of commission altogether.

1303. *Sir Philip Gibbs*: Of course, you would be gaining something by saving profits. You have to pay profits to the armament firms?

Sir Stanley von Donop: You might save a little money in that way, but I think what you would save in money you would lose in efficiency. It is a great thing for the armament firms to be there, because they encourage the development of various manufactures. It is to their interest, for example, to look round and see how they can cheapen the production of a certain thing, so that other countries who desire to buy shall come to them instead of going elsewhere. There is no encouragement to the Arsenal to do a thing like that, and it is everything to have the extra supply from the armament firms.

1304. *Sir Thomas Allen*: As Master General of the Ordnance and responsible for supply, you have told us that you were one of the few people who knew the facts at the outbreak of war. Did that knowledge at any time impress upon you that there was a disturbing inferiority in our capacity to adjust and expand our industrial situation for war needs?

Sir Stanley von Donop: I am afraid I do not quite understand. Would you repeat that?

1305. *Sir Thomas Allen*: Did your knowledge, which you have indicated to us that you possessed, of the real facts of the national situation at the outbreak of war impress on your mind at any time that in this state of emergency there was a disturbing inferiority in the armament firms' capacity to expand and adjust themselves to the industrial situation in a time of national need?

Sir Stanley von Donop: No. You see, at the commencement of the War we had only provided, and were only allowed to provide, for our seven divisions. We had everything we wanted, and the firms were fully capable of supplying what we wanted. I am afraid I have not got the gist of what is in your mind.

1306. *Sir Thomas Allen*: You have stated that "previous to the War there were very few firms in England capable of manufacturing guns, rifles and ammunition".

Sir Stanley von Donop: Yes.

1307. *Sir Thomas Allen*: So that it must have been known to someone that we were not capable under emergency of very great expansion?

Sir Stanley von Donop: Yes; but I would rather answer that, if you do not mind, by putting a question to you. Is there anybody—except one man I can name—who ever visualised our having an Expeditionary Force larger than six divisions and a cavalry division? I have asked a number of Generals. I know that the Generals at the War Office, the Chief of Staff and others had not visualised it, and I think I am safe in saying that if any Secretary of State for War had walked down to the House and said he wanted to double the Expeditionary Force and raise its strength from six divisions to twelve, he would have been out the next day. The only man I knew who visualised this was Lord Kitchener. Therefore, you see, it is rather difficult for me to answer your question, because nobody had visualised it.

1308. *Sir Thomas Allen*: In October, 1914, when the Cabinet Committee was called and they requested the armament firms to produce larger quantities, they did actually promise, and they must have known their own capacity to fulfil that promise. My point is this. Is it your view that they were

called upon to perform a task that their organised capacities were quite incapable of fulfilling and that they ought not to have been called upon to make that promise, either under pressure or otherwise?

Sir Stanley von Donop: They came to that meeting in October—that was the meeting at the War Office when I think there were eight Cabinet Ministers present—and they were all asked whether they could not increase what they had promised to supply, and the Ordnance Factories said they could not. The other firms, Elswick, Vickers, Beardmores and the Coventry Works all said "Yes, we think we can but we cannot promise" and a representative of one of the firms said to me "We are not going to be pilloried afterwards because we have not done it. We will try to do it." They went off thinking they would be able to do it. The only reason they could not do it was that they found almost every other country in the world demanding machinery from America. They could not get the machinery to do it and that was why they failed.

1309. *Sir Thomas Allen*: It seems to be in my mind that Dr. Addison told us that, after the Conference of October, 1914, and after pointing out the difficulties to which you have referred, the firms did express their ability to provide supplies by the dates given and in the quantities stated by him, and ultimately proved that they were utterly incapable of doing it.

Sir Stanley von Donop: I was present at the meeting. I do not know what Dr. Addison was doing then; at any rate, he was not there. All I can say is that the firms said they would try and do it and, as I say, one of them came to me afterwards and said "Remember, we only said we would try to do it. We will try our best, but we will not be pilloried if we fail." I am certain that every one of them did their best, but it was out of their power to do it. First of all they had serious difficulty in getting machinery. The whole world was out for machinery, they could not get it over. Also they were hampered by the Trade Union restrictions; that caused enormous trouble. Firms came to me and said "If you can get the Trade Union restrictions removed, we can increase our output by 25 per cent. at once." But on the 21st January, 1916, the Prime Minister, Mr. Lloyd George, I noticed, was still begging the Unions to remove the restrictions; they had not done so.

1310. *Chairman*: They ultimately did?

Sir Stanley von Donop: They ultimately did, but it took a long time.

1311. *Sir Thomas Allen*: I would like you to develop the point raised by Sir Philip with regard to subcontracting. You said that permission was given to armament firms to place sub-contracts with non-armament firms for components which they were capable of manufacturing. I seem to remember that, in nearly every big manufacturing district, there were meetings and protests from other firms about not being allowed to come in. Those complaints were also voiced in the Press and in Parliament. How far did they really make use of this permission to ease the situation and to facilitate the supply; and was there, in your view, any aversion on the part of the recognised armament firms to employ these subsidiaries?

Sir Stanley von Donop: I say absolutely none, from my knowledge. They were only too keen. If they could divert any of the simple components to firms that could make them, they were only too ready to pass them on to subcontractors. I have heard that complaint often raised. People said "You are not employing these people." I replied "Just send them to the Arsenal and we will show them what to make." Many went, but they all shook their heads when they got there; they said "We cannot do that". I do not think there is any justification for

10 October, 1935.] Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

saying that any of the armament firms refused to employ other firms on sub-contracting. They were all out to help.

1312. *Sir Thomas Allen*: I would like you, if you will, to elucidate a little further this question of the shortage of shells. I want to get it clear in my mind. Dr. Addison gave us his figures as part of his evidence. In response to a question put to him by the Chairman, he said that, as far as his exhibits and appendices went, they could be accepted as part of his evidence and he assured us that those figures were correct. Do you remember hearing about a shell scandal during the time of the War—in fact, I believe it was debated in the House of Commons—and the shortage of ammunition, particularly high explosive ammunition for field guns? I think that really led to the formation of the Ministry of Munitions. Am I right?

Sir Stanley von Donop: I cannot tell you. I was not Prime Minister at the time. The Prime Minister never told us. I know it has been reported so; they reported it as that, and they reported it as something connected with the Admiralty, but what it was I do not know.

1313. *Sir Thomas Allen*: You have not made a very careful study of Dr. Addison's evidence.

Sir Stanley von Donop: Oh! no.

1314. *Sir Thomas Allen*: Therefore, you are not competent to say whether the figures he gave us are correct or otherwise.

Sir Stanley von Donop: No. I cannot say that.

1315. *Sir Thomas Allen*: You have said that with all the advantages that the Ministry of Munitions had, it was 11 months before the first complete round of manufactured ammunition was available. In the statement read to you by the Chairman just now, Dr. Addison gives the reason for that. He says that difficulties and delays occurred during the first year of the Ministry of Munitions because design was not associated at the start. You would not expect construction to proceed in the absence of design, would you? Do you think that, under the circumstances, and having regard to the whole situation, there was any time lost by the Ministry of Munitions?

Sir Stanley von Donop: Yes. I will tell you what is in my mind. Directly the Ministry of Munitions was formed, someone—I forget who it was—came over from there and said "What can we do to help you?" I replied "You can get these six things." I put them down and said "Get them in that order." I put shells at the bottom. I said "Anybody can make shells. It is the fuses and other things that we want." Off they went. At the end of two months they had not placed a single order for anything except empty shells. My answer is that they could have, if they had known anything about the subject. I am not blaming them; the fact remains that they did not know.

1316. *Chairman*: You will appreciate they were just making a start?

Sir Stanley von Donop: Quite so. They had considerable assistance. They took most of my staff away. They wanted all the experts. We gave them all the help we possibly could.

1317. *Sir Thomas Allen*: And would you agree, having had to start after others had failed, it is all the more necessary that this, shall I say absurd, position should not be reached again?

Sir Stanley von Donop: I do not know quite what you mean by saying "where the others had failed."

1318. *Sir Thomas Allen*: Failed on the evidence, partly your own evidence, and the evidence of Dr. Addison. Their efforts were inadequate to meet the situation.

Sir Stanley von Donop: We failed to meet the situation, but I would not say that it was failure to do what was possible. We failed to do the impossible. That is my point. By the beginning of

June or July we were producing an enormous amount of ammunition and all the others had got to do was gradually to increase it. I do not admit for one moment that we failed. We did not do what we had hoped to be able to do. As I say, we were faced with the increase of the Expeditionary Force from 7 Divisions to 70 Divisions and the War had shown that a much larger number of rounds per man were being fired than had been legislated for.

1319. *Sir Thomas Allen*: Then we may take it that your point is that the inability of the armament firms punctually to meet the demand was due to circumstances beyond their control?

Sir Stanley von Donop: Yes, absolutely. That is my point.

1320. *Professor Gutteridge*: One hears a great deal about shells in this connection and one often wonders whether the people talking about shells really know what they mean. But there were other things besides shells?

Sir Stanley von Donop: Yes.

1321. *Professor Gutteridge*: Was there any serious delay in obtaining heavy ordnance and that sort of thing?

Sir Stanley von Donop: You say "serious delay." We could not produce it in a day.

1322. *Professor Gutteridge*: Were the complaints chiefly about shells?

Sir Stanley von Donop: The whole thing. The "Daily Mail" and others shouted out the word "shells"! They did not know what they were talking about. We had millions of shells. What we wanted to get were the fuses and propellants.

1323. *Professor Gutteridge*: The tubes?

Sir Stanley von Donop: The tubes were fairly easy to get. The shells were easy. We knew that we could get the empty shell as easily as possible. The components were difficult to get.

1324. *Professor Gutteridge*: Was there any difficulty about the propellants?

Sir Stanley von Donop: Yes; it was very difficult to get propellants. I received an offer from America—I think it was in October, 1914—to supply a million rounds of 18-pounder ammunition. The shell we had never seen, but that was a simple thing. The fuse we had never seen. We did not know anything about it. It was a new fuse altogether. The propellant was new. We did not know very much about that. There we were faced with a million rounds and £3½ millions to pay. I remember going to see Lord Kitchener on my way back from lunch and I said to him, "Look here, sir, this is what I am faced with. Here is an offer from an American firm, but they have never made a round of ammunition of this sort for us before." I told him the fuse was a new one, the propellant was a new one, and the shell was the only thing we knew anything about. I told him the cost was £3½ millions. He said, "That is rather a large sum." "Yes," I said, "but if we do not place an order here, I do not know where else I can get it carried out. The whole of the firms are full up." Lord Kitchener said, "Place the order and let me go to lunch." That order for a million shells was placed and it was fulfilled most successfully. They came just at the nick of time, at the second landing at the Dardanelles. We were able to utilise the ammunition with great success.

1325. *Professor Gutteridge*: You say it was a new fuse and a new propellant.

Sir Stanley von Donop: Yes.

1326. *Professor Gutteridge*: That was something that had just been invented. You did not know anything about it.

Sir Stanley von Donop: We knew something about the propellant. I think it was composed of ballistite.

1327. *Professor Gutteridge*: Was it something that had been invented in this country?

Sir Stanley von Donop: No, it was American. Did I not mention that?

10 October, 1935.]

Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

1328. *Professor Gutteridge*: I did not realise that it was an American invention.

Sir Stanley von Donop: Oh! yes.

1329. *Professor Gutteridge*: In fact, if it had not been for American aid, we might have been in serious difficulty?

Sir Stanley von Donop: Up to that time America had refused to making anything for us. I think they were afraid of sabotage and other things. There was great difficulty in getting America to start on it. I placed this order and in two days I was informed that Mr. Schwab, the representative of the firm, was in America, and I was asked if he came over here would I arrange an interview for him with Lord Kitchener. I said yes. He came over and I warned Lord Kitchener that he must be very kind to him. Lord Kitchener so impressed Mr. Schwab that Mr. Schwab said "I will go back and devote the whole of my factories to the needs of England" and he did. Then other firms in America said "By Jove! this is the way to make money", and they all wanted to come in. That firm, the Bethlehem Steel Corporation, was the first to tackle the supply. Then all the others came in. That was the firm that had the new fuse and the new propellant.

1330. *Professor Gutteridge*: I am asking you this because it has crossed my mind more than once that it is just as possible for a big national factory to be caught out in such circumstances as a private firm. There must be an appreciable time for any expansion to take place. You cannot expand in a very short time.

Sir Stanley von Donop: No. You cannot get the supervisory staff. I think it was the Elswick Ordnance Company which came to me and said "If you could get the extra supervisory staff, we could expand our works at once by taking on 2,000 extra men." The superintendent of the ordnance factory came to me and said "For every hundred men I must have one supervisor."

1331. *Professor Gutteridge*: Do you think the supervisors can be trained in advance?

Sir Stanley von Donop: Yes, if you like to pay for it.

1332. *Professor Gutteridge*: It would not be a very expensive thing, would it?

Sir Stanley von Donop: I am not prepared to answer that. There is this to be said. You would have to have the trained men working on lower class work than they are really fitted for.

1333. *Professor Gutteridge*: I suppose one difficulty would be that military demands fluctuate very much and you might have to keep a large proportion of the staff standing idle at the national factory?

Sir Stanley von Donop: If you have a large national factory, capable of supplying on a large scale in war time, many would be standing idle in peace time. That stands to reason, but if the firms other than the ordnance factories have demands from other nations, they can keep the staff going and then, when war comes, they can devote the whole of their staff to our requirements.

1334. *Professor Gutteridge*: Your demands, as Master General of the Ordnance, must be always influenced to some extent by current policy. It may be highly unpopular for the government to demand munitions and therefore there may be a shortage of munitions, in a sense, on political grounds.

Sir Stanley von Donop: My answer to that would be this. In my experience, I have never found a government that did not tie us down to every penny. We have had to fight for every penny. Of course, in war time it is different.

1335. *Chairman*: I do not quite follow the system under which the Arsenal became self-supporting. For instance, if an order is given to the Arsenal, who fixes the price at which the article is supposed to be sold?

Sir Stanley von Donop: I am afraid you have got me a little out of my depth, Sir John.

I do not know who fixes it. I know there is something called the Price Fixing Department or the Price Fixing Committee. It was all based more or less on the marketable value of the shell, the fuse, or whatever it was, and the prices were adjusted in such a way that the cost of all the things that were produced by the Arsenal equalled the cost of wages, upkeep of buildings and everything on the other side, the only difference being £100, which they put into the estimates as a token to allow a debate to go on.

1336. *Chairman*: The Arsenal do not know at the beginning of the year how many orders they are going to get?

Sir Stanley von Donop: No; they do not know that, Sir. At the allotment meetings we had, when we allotted the orders, we had the Ordnance Factory Superintendent there and we said to him: "If we give you an order for so many 18-pounder shells, will that suit you?" He had to keep 10,000 people employed. He replied: "If you can give us in the shell shop an order for so many, that will keep us going." And we divided the rest among the armament firms outside.

1337. *Chairman*: Thank you. If you look at page 117 of Dr. Addison's Appendix, you will see what he says about sub-contracting. You have been asked a good many questions about that. I think I ought to ask you a question about paragraph 69, where he says:—

"With regard to sub-contracting the additions to such supplies as the firms themselves were able to provide that were obtained in this way were less than might have been anticipated and made no substantial contribution to the total output."

Do you agree with that?

Sir Stanley von Donop: No. I should not agree with that. I think the firms got considerable help by their sub-contracting. I cannot quite give you the details, for this reason, that we gave the contract to the firms and it was up to them to place the sub-contracts as they liked, as long as we knew what they were doing. We left it to them. They were responsible for turning out the completed article and we allowed them to do the sub-contracting.

1338. *Chairman*: He goes on to:—

"The reasons were threefold:—First: in the circumstances of the time the patriotic impulse of other firms was to prefer to manufacture for the State rather than for a major contractor. This disposition was manifested in the strong demand for a wider spread of war orders that had become very pronounced before the Ministry of Munitions came into existence."

Is that correct?

Sir Stanley von Donop: Yes. It really came to this. There was a great cry in the House, if you remember, "Business as usual," in the early days of the War. Everybody thought they were going to make a lot of money out of the War, they thought the War would not be a long one, and at that time firms hesitated very much to take any sub-contracts because it interfered with their particular work. Then, as the War proceeded and it was seen that we were in for a long war, the trade of these sub-contracting people gradually dried up and they came round and said: "We should like to have this sub-contract." Then, as soon as they had learned how to make the articles, having been taught by the main contracting firms, they said: "Why should not we have direct contracts with the Ministry of Munitions instead of taking only sub-contracts?" because they thought they would make more money out of it.

1339. *Chairman*: The next point is:

"Manufacture depends upon an adequate supply of precise drawings, specifications, gauges, etc., and these the major firms were unable to supply in any adequate measure to their sub-contractors. Indeed, the shortages in these respects, especially in the supply of gauges, involved delays extending

10 October, 1935.] Major-General Sir STANLEY VON DONOP, K.C.B., K.C.M.G.

[Continued.]

over three or four months after the Ministry was constituted before it was able to provide them in sufficient numbers. The provision of a supply of these critical 'key' requirements beyond their own needs clearly cannot be expected to be the business of private manufacturers."

Sir Stanley von Donop: That is all perfectly true.

1340. Chairman: Then,

"The placing of miscellaneous orders to fill the blanks in their own production created confusion in the processes of inspection and assembly and involved activities that were not in line with the ordinary work of manufacturers."

Is that correct, do you think?

Sir Stanley von Donop: I could not tell you anything about that without talking with the firms and seeing their difficulties. It is a sort of general statement to which I could not give an answer one way or the other.

1341. Chairman:

"It should be remembered that a completed article like a shell, for example, consists of a great many parts and the processes of co-ordinated assembly and inspection for the provision of completed supply are of vital importance. The state of affairs that was found to exist can only be described as chaotic, and one cannot imagine how these sections of the work could possibly be efficiently managed except by a central organisation with full knowledge over the whole field. What applies to constituent manufactured parts applies with even greater force to the assembly and filling in an orderly manner of primers, gaiters, shells, cartridge cases and the rest which make up a 'completed round'."

What do you say about that?

(The Witness withdrew.)

Major-General The Honourable Sir FRANCIS R.

1344. Chairman: May I give a statement of your positions, so far as it has been supplied to me. You were Chief Instructor of the School of Gunnery, 1911-13; Deputy Director of Artillery, War Office, 1913-16; Member of Council, Ministry of Munitions, 1916; Director of Design, Ministry of Munitions, 1916-18; Chief of British Section and President of Sub-Commission for Armaments and Material, Military Inter-Allied Commission of Control, Germany, 1919-24; Lieutenant-Governor of Jersey, and commanding troops in Jersey district, 1924-29. Is that correct?

Sir Francis Bingham: Yes, Sir.

1345. Chairman: You have supplied us with a statement of what you wish to say to us.

Sir Francis Bingham: Yes.

1346. Chairman: Would it be convenient if you were to read that, or would you sooner make a separate statement?

Sir Francis Bingham: So much of what is in my mind has already been said by Sir Stanley. I served under him at the War Office and I have asked for permission to give evidence to-day because I consider that he and I are the only two people living, except the members of the firms, who can speak of what the armament firms did in those early days of the War. I gave orders—of course, under the Chief—for every round of ammunition ordered from August, 1914, until May, 1915, and I want to say here publicly that we owe a deep debt of gratitude to the armament firms for what they did in those months. They did not fulfil their promises, as Sir Stanley has told you, but they did marvels considering the small orders that were given them in peace time and considering the difficulties which Sir Stanley has already explained, and which I feel too. I am afraid I speak strongly, but I feel strongly on this subject.

Sir Stanley von Donop: What I say about that is that I am very pleased that the lesson that I had to ram into the heads of our Ministry of Munitions has produced a pupil who knows his lesson—because he did not know it at first. For the first two or three months I could not get them to understand that a shell was not a round of ammunition. Mr. Balfour was sitting next to me at one of the meetings. It was about two months after we had had a meeting of the Ministry of Munitions people, and Mr. Lloyd George turned to me and said "General, you have got to remember that a round of ammunition does not only mean a shell". Mr. Balfour turned round to me and said "General, fancy his telling you that, when you have been ramming it into them for the last two months." It is quite true the completed article, the shell, consists of a large number of things. When I put down "shells" and "components", they did nothing but order shells for two months. Anybody could make shells.

1342. Chairman: Is there anything you want to add?

Sir Stanley von Donop: There is just one matter. May I be allowed to ask this question? With all this discussion that is going on, I rather want to know, for my own information, what is the policy that we are now supposed to work on? Are we to work in future on a policy of six or seven Divisions, or are we to work on a policy of 70? Because a great deal depends on that.

1343. Chairman: I should require notice of that question, and I should say if you had given me notice I could not have answered it!

Sir Stanley von Donop: It was really for my own information. I wanted to know what policy we were working on.

Chairman: Thank you.

BINGHAM, K.C.B., K.C.M.G., called and examined.

To show you the shortage of machinery: In November, 1914, I personally had to say whether four turret lathes for the manufacture of guns were to go to the Arsenal or to Armstrongs. There were only four, from John Lang, of Edinburgh. There were not any automatic machines in the country, they had to be ordered from abroad and they came into the country in the early spring of 1915. Labour was in a very unsettled state and the rules of the A.S.E. were very restrictive; in my opinion they would not have tolerated at that time the control to which they were eventually subjected until the seriousness came home to them in 1915.

The statement has been made that we only employed the armament firms, but this is not correct. When Lord Kitchener told us that the Army had to be increased my orders were to get everything that I could and where I could, and I have a paper here which will show you the numbers which I ordered. When I say "I," I was naturally under the Chief. This shows that I ordered 15,000,000 shells from America, nearly 11,000,000 from Canada, 11,000,000 from the trade in England, and 1,500,000 from the Ordnance Factories, and I say this, that those orders were given—not, as Dr. Addison says—because of the failings of the armament firms, they were given because we saw no other way of getting them, and I took everything, wherever I could get it. In those months I refused only two orders—one was fraudulent, which I need not go into, and the other was the offer of a commission agent who would not deal with Morgan's.

I am making this statement as short as I can, Sir John, because you have already heard a lot about the matter. Now I come to the most important part. Without the design department of

10 October, 1935.]

Major-General The Honourable Sir FRANCIS R. BINGHAM,
K.C.B., K.C.M.G.

[Continued.]

the armament firms we should have been without the best guns and howitzers of any army in the field. Without going into technical details, I can say that with the exception of the guns taken to the field by the Expeditionary Force every new gun and howitzer was designed by the experts of Vickers and Armstrong from 1914 onward. May I give you a little sidelight to show their value. One of my German *vis-a-vis*, when I asked him which was the best gun in any of the armies, replied, "There is no question. Your 6-inch howitzer designed by Vickers. I asked, "How do you know?" "When they were captured" he said "they were given to me to use." I apologise for that interpolation, I say that to illustrate the value of the design departments of the great armament firms.

If there is an idea that a Government Department for the supply of war material can function without the help of armament firms, then I say that the nation adopting this practice would be working with one hand tied behind its back. And why? No nation, no government, can afford to pay in peacetime the great technical experts that those firms employ, to whom they pay high wages. They have a knowledge of what is going on with regard to foreign armaments—probably they are making them—and their knowledge is at the disposal of our country when it is required. Do France or Germany, for example, trust to a government organisation for their material? I know they do no such thing. It may interest you to know, Sir, that we inspected 7,000 factories that had made war material for Germany of one sort and another. They did not trust the government factories.

Dr. Addison stated that if there had been a Ministry of Munitions in August, 1914, thousands of lives would have been saved. I ask you, Sir: Who knew what the expenditure upon gun ammunition would be? The only information we had was that, during the four years' war between Russia and Japan, the Japanese fired 1,000 rounds per gun. I know what Germany had, I know what France had, I know what we had. They all kept 1,000 rounds per gun as their stocks. Supposing there had been a Ministry of Munitions then. You can hardly imagine it because you would not want a Ministry to supply six divisions. Also, who knew then that we would eventually have to control the whole of the labour of the country, the whole of the raw materials of the country and divide it up as between the public and the Services? Nobody knew the requirements, nobody knew what sort of supplies were wanted, and they did not begin to trickle in until May, June, July.

Later on, I see that Dr. Addison says that some Artillery Officers were averse to employing firms other than the armament firms. I must confess I cannot think where he got this idea. I was the Officer who ordered the ammunition and I employed everybody I could get hold of in this country—as I told you before, in America, in Canada, and I even ordered ammunition in India.

Dr. Addison states, in paragraph 7 of his evidence, on page 110, that a few orders were placed in Canada with the Canadian Government. He forgot to state that I personally ordered £6,000,000 worth in America and considerably more through Messrs. J. P. Morgan. I do not know whether you would care to have those figures. They show the orders placed by the War Office between August, 1914, and May, 1915.

1347. *Chairman*: Yes. Thank you. (Statement* handed to the *Chairman*.) This will be appended to your evidence and will become part of the record.

* Appendix, p. 228.

Sir Francis Bingham: This is actually an extract from the War Office Contract Book.

If I may amplify one point which I understand is the main point. Dr. Addison talks about the necessity of a Ministry of Munitions in 1914. I have said it is unthinkable. But it is not unthinkable for another war, now we know that you may possibly have to take the whole of the labour, the whole of the raw material, and control everything. In my humble opinion, there should be a skeleton, a nucleus, a cadre, to come into action at the commencement of the war.

1348. *Sir Thomas Allen*: Before you proceed further: In addition to possible, would you say that it is desirable, in that event?

Sir Francis Bingham: I only state my own opinion. It would be desirable. Knowing what we do now—and we had the bitter experience—I would say in peace time certainly not, because no country can afford to pay for it and keep it going and it would get starved financially. My personal opinion is that there should be a cadre that would come into action at the beginning of the war, but, to provide for the lag until it came into production, you must rely, as we did, on the Ordnance Factories and the armament firms.

1349. *Chairman*: That was the result of your experience during the War?

Sir Francis Bingham: That was the result of my experience—a bitter one, I am afraid.

1350. *Chairman*: Do you wish to add anything?

Sir Francis Bingham: No, Sir John. I have said what I wanted to come here and say. I want to express my gratitude—when I say my gratitude I mean the gratitude of the people who were trying to get the stuff—to the armament firms for the way they expanded and did the best they possibly could.

1351. *Sir Thomas Allen*: I think it ought to be made clear that Dr. Addison was not so much concerned to make an attack on the armament firms. I do not think, throughout the whole of his evidence, it can be shown that he did make any direct attack upon the armament firms, as such. I think he would be the first to admit that they did their best under the circumstances in which they were placed. His whole case, as far as I understood it, was that the system under which they had to work at the beginning of the War was such that it was not enough and that reliance on that system was a dangerous thing and, as far as practicable, the system should be amended in that respect in the future.

Sir Francis Bingham: Quite so, Sir. I am afraid I have been talking of the past. I have been saying how we were and shall be in the future relying on the armament firms and the Arsenal. I do not say he made an attack, but I was bound to make a reference to his statement that only a few orders were placed with them owing to their failure. I draw attention to the actual facts. One more point. As I am not an expert on pricing and costing, I have not said anything about it, but, as Dr. Addison has said a great deal about costing, I would say that I am perfectly certain that it would be far cheaper for the country to pay the little extra in overheads on what they order from the armament firms than to pay for an expensive government department which, if you had peace for a number of years, would be growing idler and idler and deteriorating. In fact, it would be a much cheaper proposition and just as serviceable.

1352. *Chairman*: Thank you. We now adjourn. There are no more witnesses to-day.

(Adjourned.)

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TERMS OF REFERENCE,—

(1) To consider and report upon the practicability and desirability (both from the national and international point of view) of the adoption (*a*) by the United Kingdom alone, (*b*) by the United Kingdom in conjunction with the other countries of the world, of a prohibition of private manufacture of and trade in arms and munitions of war, and the institution of a State monopoly of such manufacture and trade.

(2) To consider and report whether there are any steps which can usefully be taken to remove or minimize the kinds of objections to which private manufacture is stated in Article 8 (5) of the Covenant of the League of Nations to be open.

(3) To examine the present arrangements in force in the United Kingdom relative to the control of the export trade in arms and munitions of war, and to report whether these arrangements require revision, and, if so, in what directions.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON THE PRIVATE MANUFACTURE OF AND TRADING IN ARMS

TENTH DAY

Wednesday, 30th October, 1935

PRESENT:

The Rt. Hon. Sir JOHN ELDON BANKES, P.C., G.C.B. (*Chairman*).

Sir PHILIP GIBBS, K.B.E.

Dame RACHEL E. CROWDY, D.B.E., LL.D., R.R.C.

Sir THOMAS ALLEN.

Sir KENNETH LEE, LL.D.

Professor H. C. GUTTERIDGE, K.C., LL.D., M.A.

Mr. J. A. SPENDER.

Mr. E. TWENTYMAN (*Secretary*).

Mr. D. HAIGH (*Assistant Secretary*).

Mr. P. J. NOEL BAKER, M.A., called and examined.

1353. *Chairman*: Mr. Noel Baker, I should like, if I might, first of all to put on record what your experience has been. I see that in your Statement* you say: "Throughout most of the period since 1918 I have been more or less closely in touch with the actual conduct of international affairs. I was a member of the British Delegation to the Peace Conference in 1919; personal assistant to the Secretary General of the League of Nations 1920-22; private secretary to the principal British Delegate to the League of Nations 1922-24; personal assistant to the League of Nations High Commissioner for Refugees 1925-29; Parliamentary Private Secretary to the Secretary of State for Foreign Affairs 1929-31; British Delegate to the Assembly of the League of Nations 1929 and 1930; private secretary to the President of the Disarmament Conference 1932-33."

Then by your Statement you have in various chapters dealt with the various points which you think are of the greatest importance in this particular matter, and I think I may safely say that anybody who reads the Statement will come to the conclusion that you have presented your case very fully and very carefully and very capably. Now will you say what you wish to say to us.

Mr. Noel Baker: Sir John, I want to begin, if I may, by thanking the Commission very warmly for giving me this opportunity of appearing, and apologising for abusing their indulgence by presenting such a very lengthy statement of evidence as that which I have submitted. I am afraid, in spite of the kind words which you have just said, that members of the Commission may have thought that it was too verbose. I did my utmost to keep it within reasonable limits, but the difficulties were rather considerable because I think that this is more or less the first occasion on which any academic student—and so I call myself primarily, for so I started—has attempted to make a coherent, reasoned examination of all the technical and practical arguments which are advanced in favour of the system of private manufacture. It is very difficult to deal with those arguments in a summarised form—at least, so I found when I was trying to do so—because either you misrepresent the arguments, or else you make your analysis of the arguments incomplete or inadequate. I dare say that the Commission have also observed that my paper is not only long, but guilty of repetition in more places than one. Again I apologise, and again I explain that those who use the technical arguments with which I was dealing, are not always guilty of what I might call the clearest of thought, and that apart from that, in certain places the technical arguments

in fact overlap, and therefore I was not quite master of the case which I had to examine.

Now, as I said, I have been studying this subject as an academic student for a very considerable number of years, and in the course of that time I have changed my view of the matter very considerably. When I began—and it was really the principal reason why I took up the study of the subject—I used to think that the moral aspect of this matter was of overwhelming importance, and I confess that I used to share the views of those who thought that the private manufacturers were guilty of such offences against the standards of civilisation which modern society accepts that they might almost be termed sub-human, and that it was urgently necessary, on moral grounds, to do something to bring their activities to an end.

I used to think, on the political aspect of the matter, that while private manufacture was undoubtedly a contributory cause, or, shall I say, a contributory assistant to the forces that make for war, nevertheless it was very secondary, and I scouted as ridiculous the view of those who spoke as though, if private manufacture were abolished, peace and disarmament could be established overnight.

On the other hand, so far as the technical aspect was concerned, I used to think that the difficulties of dealing with private manufacture would be very great, that its abolition would be an extremely complicated, if not indeed impossibly complicated, affair, and that the practical case, the concrete technical arguments, for the retention of private manufacture, were, from a certain point of view, very strong.

On all those three aspects my views have changed. I would not say that I now admire what I might call the ethical standards involved in the system of private manufacture, but I do say that in a great deal of what has been said about it there are two major errors. It is wholly wrong to fasten full responsibility, or even principal responsibility, for the results of the system of private manufacture on the manufacturers themselves. It seems to me unjust, it seems to me wrong and it seems to me fallacious. The system is created and maintained by governments, and for the most part by democratic governments, and I have argued in my Chapter III, to which I will not further refer, that in a great number of ways which I there detail, governments have actively supported the system of private manufacture, and have encouraged private manufacture in all the ways in which it is possible for governments to do so. Therefore I say it is unfair and unjust to the individuals concerned, and what is much more important from my point of view, it distorts and obscures the truth, distorts and obscures what is

* See Appendix p. 258.

30 October, 1935.]

MR. P. J. NOEL BAKER, M.A.

[Continued.]

important in this matter, to attempt to fasten more responsibility upon the private manufacturers than they ought to bear. They work a system for which, under democratic systems of government, we are all responsible.

Furthermore, however much we may object to private manufacture, there is not very much to choose, in my present view, from the ethical point of view, between the morality of private manufacture and the morality of much of the rest of the preparation for war. If one contemplates, for example, espionage, or even the actual training of men to use such instruments as tanks, poison gas and aerial bombs against other men, or against men, women and children, one is forced to the conclusion that war is amoral, that the preparation for war is amoral, and that therefore there is no reason to think that the case against private manufacture is stronger than the rest of the case against war and the preparation for war from the moral point of view.

In the second place, my view on the political aspects of the matter has changed a great deal. I have come to think the political importance of private manufacture far greater than I used. I still would not say that private manufacture is the only cause, as some people say, or even the principal cause of war, but I am nearer to the view of Admiral Lord Wester Wemyss than I used to be. I do think that the system of private manufacture is, in his phrase, among "the principal authors" of war. I do think that it is a factor of first-rate importance in the process by which wars are caused, and I would call again to the memory of the Commission the verdict of Lord Grey which I quote in paragraph 11 of my Statement, that it was the armament competition, above all other causes, which brought about war in 1914; and I recall the judgment of Admiral Lord Wester Wemyss that the system of private manufacture played a great part in stimulating that armament competition. I venture to quote again his language, because it is, as I think, very important. This is what he says. It is on the second page of my Statement:

"Apart from the moral objections to the present system, which makes warfare a direct occasion of private gain, the system is attended by the inevitable consequence"

and I note the word "inevitable"—

"that the multiplication of armaments is stimulated artificially. Every firm engaged in the production of armaments and munitions of any kind naturally wants the largest possible output. Not only therefore has it a direct interest in the inflation of the Navy and Army Estimates and in war scares, but it is equally to its interest to push its foreign business. For the more armaments are increased abroad, the more they must be increased at home"

and he goes on to speak of the

"interrelation between foreign and home trade in armaments as one of the most subtle and dangerous features of the present system of private production."

I venture also to recall to the Commission the fact that Admiral Lord Wester Wemyss had evidently followed this matter very closely for a long time; it was not a casual view he happened to form in 1918, because his biographer, who was his wife and who therefore would know what he had been thinking day by day throughout the years that preceded the War, describes in the biography how, in his view, this "subterranean conspiracy," as he called it, actually worked; and here are her words:

"For years before its outbreak he had watched the baleful activities of the armament trusts; the manner in which they had, heavily subsidising the Press, influenced public opinion in every country, stirring up strife and creating an atmosphere of hostility, ill-will and suspicion between nations."

It was for that reason that he thought that the armament firms were the principal authors of the last war, and Admiral Lord Wester Wemyss is a witness of no ordinary kind, because when he wrote this paper which I have quoted, for the consideration of the Admiralty and the Government of the day, he was the First Sea Lord, which means that he held the highest and most eminent post in all the armed services of the Crown, and he held it during the last and decisive year of the War; that is to say that there has never perhaps been, in the history of this country, and of our Empire, an officer who held greater responsibility than Lord Wester Wemyss held at the time when he wrote this paper. Not only so, but there were very few people who had greater opportunities than he had for knowing the facts from inside. It is quite evident that his judgment is based upon, one might almost say, a life-long consideration of this matter, and that it was the result of a passionate conviction which he had formed.

It is in fact confirmed by other judgments of other people, and as I understand history, the passage of time and our greater knowledge has only confirmed the view, not only that the armament competition, as Lord Grey said, was a vital factor in bringing about war, but that the armament interests were a tremendously important factor in stimulating that armament competition. To take one concrete illustration, as I understand the passage of time and the greater knowledge we have to-day, it seems to me that the Mulliner episode, if I may quote one instance, had a far greater political importance than it appeared to have even at the time.

For all those reasons, which I am afraid I have elaborated at rather great length, I feel that the political importance of private manufacture is far greater than I originally thought it, and that the political reasons for removing the armament vested interests are far more urgent.

On the technical aspect, my view of the problem has also changed. I used to think, as I said, that the difficulties of abolishing private manufacture and of establishing government monopoly were very formidable, that probably the existing system did involve some differential military advantages to the country which had a strong armament industry, and that therefore, whatever moral or political reasons one might urge, there might be military reasons which it was very difficult to set aside, at least so long as we lived in conditions of what I venture to call in my Statement "international anarchy". I no longer believe that. On the contrary, I have come to believe that the technical difficulties are probably less than in any other large-scale operation which the State would be likely to carry out, that the practical advantages of the present system are far less than they appear to be, and indeed that on grounds of practical advantage, the merely technical considerations of military advantage and nothing else, the balance would probably tip over in favour of the system of abolishing private manufacture even in the conditions of international anarchy in which to a certain extent we still live to-day.

In my Statement I have devoted by far the greater amount of time and space to these technical and practical considerations, and if there is anything of value in my statement to the Commission, I think it probably lies in my analysis of the arguments which are in current use on this aspect of the matter. I have started, for this purpose, from the proposition that the evils of the system of private manufacture are admitted, and that under the terms of reference of the Commission, what His Majesty's Government desire is to have advice as to how these admitted evils can best be dealt with, and in particular whether there should be abolition of private manufacture or a system of more or less elaborate control. I support my adoption of that starting-point by quoting a speech made by Mr. Baldwin in Glasgow

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

on November 24th last year, in which he said that he believed that the only method of dealing with "these undoubted malpractices, of which they had allegations and in some cases proofs, lay in control, and that control could be exercised." In other words, Mr. Baldwin admits that malpractices exist and have been proved.

Nevertheless, I thought it desirable, and perhaps in accordance with the wishes of the Commission, that I should offer from my personal experience some evidence with regard to what I believe to be the evil effects of the present system, to show why I have come to adopt Admiral Lord Wester Wemyss' view more fully than I used to; and I have explained in my Chapter II how I think it works, why I think the armament interest does create a powerful force in public life which, by its very nature, and without, necessarily, corruption on anybody's part, works, and must work, in favour of increased armaments, and by the very character of its connection with government departments must exercise a steady pressure in favour of an increase of armaments, whether there is political justification for such an increase or not. I have tried to state that as succinctly as I could in a paragraph in Chapter II of my Statement—

"The investment of large sums of private capital in armament production creates a permanent and powerful vested interest, the participants in which all depend for their prosperity on the policy which Governments pursue in respect of armaments. By the nature of the case, the controlling representatives of this vested interest wield great financial power, are brought by the necessities of their business into close contact with Governments Departments, and generally possess or are able to establish close political connections. This vested interest constitutes a powerful force which inevitably favours the increase of armaments and opposes those policies which tend to diminish armaments and reduce the risk of war. It exercises this influence in all important countries in a more or less open and in a more or less effective way. Its methods differ according to the political habits and practice of different countries. But whatever its methods, the effect is the same: the steady pressure of an elaborately organised and financially powerful vested interest against policies which make for peace and in favour of the increase of armaments, whether there is political justification for such increase or not."

Now, I have argued that it is not so much a matter of a variety of minor evils, corruption of government officials or the making of international rings or the selling to potential enemies or any such thing. That is not the major significance of private manufacture. It is rather that it creates a steady and permanent political influence of major importance in the public life of many nations and in the international politics of the world.

In my Statement I have cited two practical illustrations of what I mean. The first is from my own experience with Mr. Henderson at the Disarmament Conference in 1932-33. Now, anybody who was present in the early stages of that Conference and who was able to keep touch, as I was from my position, with what was really happening in the different Delegations which took part in the Conference, is well aware that at the beginning there was a very strong feeling that there must be a result, that a disarmament treaty must be made. I will not say that the views were very ambitious; they were not thinking of very drastic disarmament; but there was a conviction and a determination that there must not be a failure, that a treaty of some kind must be made. The idea of separating or dissolving the Conference without a treaty was definitely ruled out, for the reason, if you like, that there was no government there that was ready to take the responsibility of going back to its people and saying that it was responsible for the failure. Now, from the first day

onwards, the Press of various continental countries whose adhesion to a disarmament treaty was absolutely vital to success, set itself to undermine this resolution of the Conference to get a result. There was, from the first day, a continual campaign of defeatism, of misrepresentation, of suppression of the truth and of suggestion of what was false, and I noted particularly that papers which were known to be under the influence of armament firms, or owned by armament firms or by those who were interested in armament firms, were the leaders of that campaign. I noticed that it was by no means confined to those papers, that other papers, the policy of whose parties was normally in favour of peace and disarmament, were often guilty of gross misrepresentation. I noticed that if things were going well in the Conference, the attack was always particularly severe. It was not my own personal observation only; a great many people have talked about it, and some responsible people have described it in public utterances.

I will cite one public utterance, because I happen to know both the men concerned, and I know them to be of the highest possible integrity and international standing. The extract which I am going to quote is from a speech by Senator Rolin, of Belgium, whose standing in Belgium, and indeed in Europe, will be well-known to the Commission. It was a speech on the subject of private manufacture in general and the relation of private manufacture to disarmament. It was delivered in the early months of the Disarmament Conference in 1932, at a time when the disarmament question was greatly complicated by the issue of the Japanese aggression in Manchuria, and M. Rolin was discussing the action of the Press of a great many countries in favour of Japan, and in particular in France, which had always been for the policy of collective security, but yet, when a practical case of upholding collective security arose in the Manchurian affair, failed to uphold the Covenant, and where the Press, which had always spoken most strongly for League security, came out, paradoxically, very strongly in favour of Japan, it being known that at that time the Japanese Government had placed very heavy orders for arms and munitions of war with the French armament firms.

Now, this is what M. Rolin said. I will read it in French, with the permission of the Commission:

Et ces jours-ci, n'avons-nous pas vu, à propos des incidents sino-japonais, la grande presse de la plupart des pays déformer de la façon la plus évidente les événements qui se passaient là-bas, oublier de la façon la plus criante les garanties que leur propre pays pourrait demander un jour à la Société des Nations, et prêcher cyniquement la violation du Pacte? Et comme je m'en étonnais, un Français bien informé de ce qui se passe dans la presse de son pays et qui occupe une position officielle dans un grand organisme international m'a dit, en levant les bras avec découragement: "Que voulez-vous? Ils sont tous payés!"

I know the French official in question; I know his integrity and his knowledge of the Press of his own country and indeed of other countries, and I regard that as a very serious piece of evidence that in fact money was used by vested interests to secure the misrepresentation of what was taking place in the Disarmament Conference.

Now that was supported by further experience of my own in the lobbies of the Conference. When things were going well, not only were Press attacks made and not only did they become keener as things went better, but also rumours used to spread like magic through the lobbies of the Conference that the Conference was about to break up, that such and such Great Power delegations had come to an agreement that there must be an adjournment for an indefinite period of time. Now those rumours did not happen once or twice, but on dozens of occasions, always in a new form, usually connected in a very ingenious manner to something which was true, so as to give them an air of verisimilitude. They were very

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

persistent; they were very demoralising; they had every air of being organised, to anyone who followed the matter rather closely, as I did. They always came from nowhere; I could never trace the original source. They were always untrue, and I say that with a knowledge of the facts; and I came to the conclusion that there was no doubt whatever that they were in fact the work of paid agents, like Mr. Shearer. But, of course, in view of Mr. Shearer's subsequent experience after he left Geneva in 1927, his condemnation by President Hoover and his experiences in court, these agents did not follow his example of making their activities publicly known; they acted with the utmost discretion and covered up their tracks. I used to hear, from those who thought they knew, talks of a central propaganda office organised in another city further up the Lake of Geneva, and I was even given the name of the man who was head of it. I was never able to trace it through, and I do not offer any evidence on that point. That does not alter my conviction that Mr. Shearer's spiritual brothers were at work in the Conference.

Now I do not want to dilate too long on this question, but I would like to offer one other piece of evidence, and I hold it in my hand. It is a special edition of a Parisian journal which is called, as the Commission will observe, *Nous*. It is dated February, 1933. That was a critical moment in the history of the Disarmament Conference, when it came nearest to success. It followed the French proposals made by M. Paul Boncour for the settlement of the question of man-power. It was at the time of M. Pierre Cot's proposals for the total abolition of air forces. It came simultaneously with the British Government's programme of work which followed Mr. Baldwin's great speech in the House of Commons on air disarmament, about which I shall say another word in a moment. It came at a time when the Daladier Government was ruling in France, a government which worked with all its power to secure a disarmament treaty, as everyone who was in Geneva at that time will agree. A credible witness has assured me in writing that 70,000 copies of this paper were printed. Certainly I know that it was widely distributed on the bookstalls in France. It was issued, as I say, in February. It was redistributed in September, 1933, shortly before the critical meeting at which Germany left the Disarmament Conference of the League of Nations. At that time I am told by the same credible witness that it was sold, and that she purchased it on the streets of Paris, in September, 1933, although at that time, according to her, the office of the paper had been shut up and the paper was no longer being issued. It was cited, with this issue as evidence, in important articles in the British Press in March, 1933, and in the September of that year. Now when the Commission look at this special edition they will see that it is a very elaborate study of German re-armament, that it is done by people of the highest possible *expertise*—no journalist could have done that; it is impossible—that it was very costly, that it is full of tables, photographs, diagrams of all kinds; some of the photographs, unless I am mistaken, must even have been faked, and that, I think, is a costly process. It was obviously the result of many years of work. It goes back a long way into the post-war history of Germany. It is very highly tendentious. Issued in February, 1933, it came out at the moment when Hitler came into power—in other words, before the German rearmament had begun—at the time when, as determined by Marshal Foch and the Allied Commissions in Germany, Germany was really effectively disarmed. But no one could read that paper and take it at its face value without believing that Germany was more heavily armed than she had been in 1914, and perhaps more heavily armed than any other power in Europe.

Now I conclude from this, and I submit to the Commission that it is a justified conclusion, that

that special edition of *Nous* was undoubtedly paid for by vested interests which were hostile to disarmament, which desired to defeat the work of the Daladier Government for securing a disarmament treaty in Geneva, and that it was probable that large sections of French public opinion, and perhaps even beyond France, since it was used by the Press in other countries, were influenced in that direction.

Now I go on, Sir John, to my second illustration; and here I want to ask for the indulgence of the Commission because I realise that I am doing something which may earn me great hostility in certain quarters, and which may seem unjustified to some honest people. I do it because I have a very deep conviction that what I say is the essential truth of the matter. This illustration is drawn from the history of the debates on air disarmament in the last few years and the part which has been played by our country. The main propositions I have put forward in my Statement are as follows—that the Disarmament Conference very nearly came to an agreement on drastic measures of air disarmament combined with the internationalisation of civil aviation; that that, if it had been carried through, would have been of supreme strategic advantage to our country, because it would have made it once more an island and would have secured our overseas supplies, on which we depend for our lives and for our industry, from the terrible menace of air attack; thirdly, that drastic air disarmament and the internationalisation of civil aviation was vastly to the real long-period interest of this country and of the air manufacturers, the air industry, the air interests themselves.

On those propositions I will not say very much. I was at the Disarmament Conference, I heard all the debates, and I am perfectly certain myself that it is true to say that it very nearly succeeded, that if our technical delegates in the Air Committees had thrown their whole heart into supporting Mr. Baldwin's appeal for total air disarmament instead of obstructing what was done to achieve that end, then total air disarmament would have been achieved; that the forces in favour of it were so strong, that so many Great Powers had agreed in principle—even Germany withdrew her opposition—that if we had come in on the right side and had fought for it, I believe it would have been irresistible in the Conference.

I will say no more on the strategic advantage to this country. It seems to me that we have only to think about it for one moment to see that it is true that if we could get rid of air warfare and the danger of air warfare altogether, nothing could do so much to give us real national security both for ourselves and for the British Empire as a whole.

I will not say very much about the interests of the air manufacturers and the air industry. I do not think they very often reflect on the fact that if another war does begin their factories will be the first target, that by their character their factories cannot be protected—they cannot be put underground; they are much too big—they will be a very vulnerable target indeed. And I am perfectly certain that the air manufacturers—I say this having read a great deal of their writings and speeches—do not give anything like sufficient importance to the immense expansion of civil aviation which the world now requires, and which the internationalisation, as it is called very loosely, an international regime for the control, of civil aviation, would permit.

I will give an illustration. I have said in my Statement that I think that air lines could perform for the world at large the same kind of service that railways now perform for national states. The total capital of all the commercial air companies in the world at the present time is about £16,000,000. The capital of the Great Western Railway alone is something like £300,000,000. If we could get real internationalisation of civil aviation, the use of which is now required for mail purposes, for passenger purposes, and even for freight purposes throughout the

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

world, we should in due course have an expansion of that order. I would make a comparison with the ship-builders of the pre-war era who, if you judge by their annual reports to their shareholders, rejoiced a good deal in the prosperity which came to them from the naval competition between this country and Germany. They used to say at that time that one-fifth of the whole industry of ship-building in this country was employed in naval work. It is quite true; but that competition, as Lord Grey says, was the decisive factor in bringing the War. The War has brought a great wave of economic nationalism to the world, and as a result over four-fifths of their industry has languished ever since. In other words, the real long period interests of ship-building were very seriously compromised by that naval competition before the War, and I venture to think that the real interests of the air industry in this country will be compromised by this air competition into which we are going to-day.

I turn to my contention that the air interests of this country were educated to think that international co-operation, the League of Nations, peace and disarmament were all nonsense, and that it was because they were so educated that the British agents in Geneva were able to take an obstructive attitude against Mr. Bakwin's policy, instead of giving it whole-hearted support. If the air interests had even been divided, if there had been an important section of leading air experts in this country who were actively fighting for disarmament, for international solutions of the air problem, I am personally convinced that the thing would have been irresistible here and, therefore, in Geneva. When I say that the air interests were educated to think that disarmament and the League of Nations were nonsense, as I do in my Statement, I have cited two principal agencies, namely, the periodical journals which are devoted to aviation, and the Patriotic Societies which are principally interested in aviation. Now it may seem that those agencies are not sufficient to educate the air interests in any particular direction; but I would remind the Commission that air-minded people are a very special class, that aviation is a tremendously absorbing profession. As one who has never learnt to fly—and I bitterly regret it—I find it extraordinarily absorbing and fascinating myself, and I am perfectly certain that anyone who can fly must become so wrapped up in it that other interests seem entirely secondary to them, and that therefore the influence of specialised journals and specialised societies must be very great upon their minds. Therefore I think it follows that if all the periodical journals and all the organisations concerned with aviation were taking a strong line against disarmament and against international solutions, it is very likely that the air interests would be strongly affected by that fact.

Now I want to say a little about these two main educative forces. I start with the periodical journals. It is broadly true that almost all these periodical journals have taken a strong line against disarmament. Not all of them; some of them are almost entirely technical and hardly ever mention political subjects at all. Others mention them a good deal. I cite in the first place a publication known as the *Air Annual of the British Empire*, and from the preface to the issue for 1933-34—that is to say, the year when air disarmament was so much under discussion—I will quote one passage:

"Let us then seek refuge in a strong air force and not gamble with sentiment. The progress of civilisation is more likely to be hastened and the risk of war actually made less by allowing aviation to develop and to take its rightful position among the defence forces of the country. The alternatives are to retard human progress and to revert to years of attrition in which the loss of life and human suffering even among the civilian population will be far more intense, not only during the war itself but in the succeeding years of peace".

Then there is a great deal more about the futility of trying to impose restrictions on weapons.

Now that is, perhaps, only a slight indication. It does, however, represent a very definite point of view, and it is not the point of view which at that time was being put forward by Mr. Baldwin, who was the Chairman, and who has for very long been the Chairman, of the Committee of Imperial Defence.

There is a little quotation from *Aircraft Engineering* which is almost entirely technical, but which does say that to hear aeronautical experts discussing air disarmament is a very incongruous picture, and in general speaks in a very slighting way of the discussions in Geneva.

There is a paper called *Popular Flying* which, in its issue of December, 1933, says:

"For the past few years most people have had a difficult time, and some of the firms in aviation have not escaped the draught. Better times are ahead. Prophecy on any subject is dangerous, and with aviation particularly so. Never mind, let us take a chance . . . In military aviation, everything points to real activity in the workshops in the near future. It will begin when the Disarmament Conference goes to pieces, as it most certainly will. Great Britain, having showed willing by leading the way in partial, practical disarmament . . . will proceed to arm herself. It is about time. And as things are definitely looking up we may look forward to more money than usual being allocated to the Air Ministry which, if it is properly handled, should mean a bigger Air Force."

I quote from a paper called *Flight*, in its issue of the very day on which Mr. Baldwin made his speech in the House of Commons in favour of total air disarmament. *Flight* says:

"Where we join issue with the unspecified Ministers"—they turned out to be Mr. Baldwin—"mentioned above is in our absolute disbelief that bombing aircraft will ever disappear from war. . . . Let us suppose, however, that the infatuates have their own way at Geneva and forbid the possession of all bomber aircraft, or of aircraft above some fixed size. What would be the result? No single nation would believe that the rule would be kept for one moment in war, and therefore everyone would have to prepare to evade the prohibition as best he could."

It went on to say that inspection was fantastic and so on, and lastly, that air transport would suffer—a very strange conclusion.

I quote again from *Flight*. Speaking of Lord Londonderry's speech in Geneva, in which he said that abolition could only be carried through if it was made absolutely certain that the abuse of civil aviation was quite impossible—and they argued that of course such a condition could never be fulfilled from the nature of the case—they say:

" . . . we believe that Lord Londonderry's reduction of the problem (of internationalisation) to commonsense elements has rung the knell of these well-meant but fatuous suggestions for disbanding air forces."

Again they say a month later:

"In fact it seems to us that Lord Londonderry has said most politely to the Committee 'Do the impossible, and then we will disband our Royal Air Force.'"

Finally, *Flight* cites with great approval the fact that the Federation of British Industries had addressed a letter to the Prime Minister taking strong objection to the idea of internationalising civil flying, stating that such a step would endanger free development of Empire routes under British auspices—again a very strange conclusion to anybody who knew what actually happened in the discussions about civil aviation.

I now turn to another paper which I think more important than these, and which certainly deserves

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

the attention of the Commission—I mean *The Aeroplane*. Here is a quotation from the issue of October 18th, 1933:

"If nothing had been said at Geneva about abolishing bombing and prohibiting air attack, and all that other nonsense, the ordinary Englishman would never have awakened to the fact that the Air Force was in danger. But all this talk by the pacifists . . . and all the correspondence in all the newspapers of the world about the iniquity of bombing and the horrors of gas attacks and all the rest of it, most of which is sheer foolishness anyhow, has made the British taxpayer think."

It will be remembered that it was Mr. Baldwin who started the talk.

The Aeroplane says in the same issue:

" . . . within the next few weeks the Disarmament Conference at Geneva will come to an end, and it will almost certainly end without any agreement to disarm—which will be the best end it could have. Man is by nature a predatory and combative animal. Taking away his weapons will not in the least stop him from fighting."

Six months later, in July, 1934, *The Aeroplane* says:

" . . . now that the disarmament talk at Geneva is nearly done, there may be some chance of building a still bigger framework for our own Air Force."

and they go on to say:

"And now that money is easier we can afford to re-arm the whole Air Force every four or five years."

They add:

"Moreover, if the Technical Departments be properly reorganised rearmament will be much cheaper, because cheaper methods of production, which, all the same, will leave a fair margin of profit to British aircraft constructors, will follow in natural sequence."

Then in the course of that month, July, Mr. Baldwin announced the construction of 41 new squadrons; but *The Aeroplane* was still by no manner of means content. It said:

"There is no security in such a statement, either for the British Empire or for the Royal Air Force or for the British Aircraft Industry—on which last the ultimate safety of the Empire depends."

Now I come to the second question: Why is it that these papers take this line? *The Aeroplane* has explained it. It did so in an article written by the editor on January 17th, 1934, and he answers the question, which he says has been put to him by some of his readers—Why does he give so much space to international politics and all this stuff about the League of Nations?—by giving certain reasons why it is very important to him to do so. He then goes on to say:

"Moreover, if you consider the lowest possible motives, the influence of mere commerce, the greatest amount of trade done by the British Aircraft Industry, on which the existence of this paper depends, is done either with the Air Ministry, in supplying materials for the Royal Air Force, or with the governments of foreign nations in war machines."

In other words, but for the trade in war machines for our own and foreign governments, that paper, *The Aeroplane*, could not live; and I submit that if the Commission examine the files of these papers which I have cited, they will see that they have such a large number of advertisements from aircraft companies that the editor of *The Aeroplane* is very certainly right in saying that without those advertisements they would not be able to carry on.

In that connection I would like to call the attention of the Commission to an advertisement which

appeared in *The Aeroplane* on the 18th July, 1934. Unfortunately, I could not this morning put my hand on the issue and I have not brought it with me, but I can easily obtain it and send it if the Commission desire to see it. It contains an advertisement which consists principally of a picture of an important type of British fighting aeroplane or, rather, bomber, I believe it was. It was on the 18th July, 1934—that is to say, while we were still contesting the right of Germany to have an air force, nine months before we agreed to the League of Nations resolution denouncing Germany for having re-armed in violation of her international obligations—in July, 1934, a few days before Mr. Baldwin announced the creation of the 41 new squadrons which were required to meet the German air menace. This advertisement, this picture of a British military machine, was decorated with a swastika.

Now I would like to urge on the Commission that this business of a technical press which depends on an industry is an inevitable result of private manufacture, and is very unfortunate. The importance of advertisements I will just illustrate again by one more quotation from a very recent issue of *The Aeroplane*, namely, 23rd October, 1935, in which they urge that the aircraft industry shall make sure that their products are well represented in a special issue of *The Aeroplane* which is to deal with the British aircraft industry. They say:

" . . . we know that the most important officials in every firm in the aircraft industry read their *Aeroplane* regularly . . . even those firms which cannot deliver orders for foreign countries"—because they are so busy at home—"will do well to make as good a show as they can in our Special Issue, because if they cannot sell machines abroad this year that is all the greater reason for keeping their names well in front of foreign governments and foreign buyers generally. . . ."

I submit that the writing of these journals constitutes a paradox which needs investigation.

Now, Sir John, I turn to the Patriotic Societies. There are a number of them, some of them permanent, some of them mostly scientific, some of them, so far as I can make out, temporary—I do not attach very much importance to them—but none of them in favour, so far as I can discover in my investigations, of international solutions of this air problem which has so greatly exercised our own Government and the other great governments of the world. They almost all seem to be more or less actively and vigorously against disarmament and international co-operation in matters in the air, which is the more remarkable in view of the international character of aviation and in view of the actual camaraderie of those who fly, to whatever nation they may belong. There may be a perfectly straightforward explanation of all the facts that I lay before the Commission. I make no charges of corruption. I am perfectly certain that all the individuals concerned are inspired by motives of the highest patriotism, and that they sincerely believe that they are serving the highest interests of the country. If there is a straightforward explanation I hope that the Commission will call witnesses and have it.

I start with a statement made by a friend of mine who is a pilot, who happened to tell me these experiences, and from whom, therefore, I requested a written statement which I could read to the Commission. I am not going to declare the name in public here—I will give it to the Chairman if he so desires—the reason for not giving the name being that my friend desires to have a career as a commercial pilot, and the Commission will understand that that might be compromised if the name were known. Here is the statement:

"In February, 1934, I called at the office of the Air League of the British Empire, 19, Berkeley

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

Street, to inquire about the aims and objects of the League and its members. In the course of conversation I said to the man who was interviewing me: What about the other Societies, like the Royal Aeronautical Society; are you in competition with each other or do you all work together? He answered: Well, as a matter of fact, there used to be a good deal of jealousy and rivalry, 'but now, in face of the common enemy Disarmament, we are all as thick as thieves.'"

1354. *Chairman:* Who is supposed to have said that?

Mr. Noel Baker: An official in the office of the Air League. I am afraid I do not know the status of the official. Perhaps I could find out, but I do not actually know.

I would like to say one word about the pre-war organisation which was, I suppose, the original parent of the Patriotic Air Societies, the National Aerial Defence Association, as it was called. Of course, it had not a very long existence, but among the members of its executive committee there were three people who were connected with armament firms, and the chairman was not only chairman of the Association but was also the chairman of an aircraft production company.

I pass on to another organisation of which the Commission will probably have heard in one way or another, namely, the Hands Off Britain Air Defence League, which has an office at St. Stephen's House, Westminster. That appeared—at least it came to public knowledge; I follow these matters rather closely and I never heard of it before—in the early part of 1934, and its principal activity at that time was to circulate this pamphlet *England Awake!* I expect a number of members of the Commission received it. It was very widely distributed throughout this city and, indeed, throughout the country. Knowing something of these things, I doubt whether the distribution which it received could have been carried out for less than a sum of some hundreds of pounds at the least. This organisation also held a large public meeting in the Kingsway Hall, which was addressed by a number of important people. I believe Mr. P. J. Hannon actually took the chair. This pamphlet gives in a number of points a very vivid description of the terrible perils of England from air disarmament. I will not recite them; they are the platitudes of pacifist propaganda. They say that a bomber can leave the Continent with two tons of explosives and drop bombs a thousand miles away; he can leave Berlin—Germany becomes very much the enemy—at 4 o'clock and reach London at 8, and wipe out the heart of the Empire in a few moments. It goes on to say that "*our main aircraft factories are clustered round London*" and so on, and it ends with an appeal to "*create a new winged army of long-range British bombers to smash the foreign hornets in their nests*," and then with a final appeal to join the Hands Off Britain Air Defence League. Well, moved by that appeal a friend of mine endeavoured to join the Hands Off Britain Air Defence League, and wrote to St. Stephen's House and received the following reply, having inquired, I should say, what were the terms of membership and what subscription should be sent: "*I thank you for your letter, and I have much pleasure in sending you a leaflet in connection with our campaign. Please do not trouble to subscribe anything, but if you can get up a meeting locally it will indeed be a great help.*" Now there may be a perfectly innocent explanation of the fact that this organisation does not want subscriptions for its propaganda. If so, I think it is desirable that the Commission should find it out, and of course it would be very easily able to secure information, because this letter was signed by another Member of Parliament, Commander Locker Lampson.

I pass on to the Air League of the British Empire. I do not want to say anything that is unjust. I

have a great regard, a personal regard, for a number of people who have been concerned with the Air League of the British Empire, with not only those whose patriotism but whose personal integrity I am fully familiar, and who, as I say, command my fullest possible respect; but, as I say, nevertheless, that the part played by the Air League in the last twelve years has been very unfortunate. I quote from a statement of the objects of the Air League, contained in their Bulletin of December, 1923. These objects include the following:

"The maintenance of a Home Defence Air Force equal to any other Air Force within striking distance of our country; the maintenance of an Air Force capable of obtaining the mastery of the air wherever it may be called upon to operate"

—a very large order—and thirdly,

"the establishment of a thriving aircraft industry."

Now, from the very early stages the aircraft manufacturers have played an important part in the Air League. This was criticised in the House of Commons, and in reply to that criticism the Secretary of the League wrote in April, 1926, as follows:

"That the names of well-known men, some of whom may be possibly interested directly or indirectly in aviation from a manufacturing point of view, appears in the list of personnel of the League is only natural. It has always been the object of the Air League to secure the valuable advice of such men, and the League consider themselves fortunate. . . ."

and so on. And, of course, the manufacturers themselves are a little conscious of the difficulty of their position. Mr. Fairey, speaking at an Air League lunch in 1926, said: "*It follows that when an aircraft manufacturer expresses any opinion on the subject of aerial defence he lays himself open to the charge that the aircraft industry are very interested parties.*" Nevertheless, Mr. Fairey went on to give his views on the subject of disarmament, and very strange views they were, for he said that, of course, "*Disarmament in fact is not negotiated—it is dictated by the strongest power. Once we have the strongest air force we shall be able to call a halt in competition*"—etcetera—a view which was hardly borne out by the results of the Disarmament Conference, where France, the strongest air power, tried very hard to get air disarmament, and failed signally to get it.

I have said in my Statement that there is evidence of a financial connection between the private manufacturers and the Air League. I rely principally upon one extract from *The Times* newspaper, which I propose to read. The extract is as follows. It is from *The Times* dated 14th January, 1927:

"The Air League of the British Empire has received an offer, on behalf of those interested in production, of £5,000 a year for two years under certain conditions, this sum to be used in organisation and propaganda. . . . The offer was originally made to the Chairman of a Committee of Inquiry set up last year to consider how best to strengthen the activities of the League in securing a proper recognition of the value of air power within the British Empire, and yesterday the Executive Committee of the Air League . . . resolved to recommend to the postponed annual general meeting that the offer of £5,000 per annum for two years, in accordance with the undertaking given by Mr. Handley Page in his letter to Lord Burnham of 17th December, 1926 . . . be accepted. . . . The Committee of Inquiry . . . was set up last July because it was felt that the Air League was not making the headway desired . . ."—and so on. "*It was a communication from this committee which put forward the proposal outlined above as a result of an offer made by*

30 October, 1935.]

MR. P. J. NOEL BAKER, M.A.

[Continued.]

a person acting on behalf of those who were to provide the £10,000. It is understood that the financial offer made through the committee of inquiry contained a definite assurance that there would be no interference with policy on the part of those finding the £10,000, that the League's policy would be perfectly free and unfettered, and that no interference whatever, by the industries concerned, would be exercised in any manner."

I fully recognise that there was a guarantee of no interference in policy. At the same time, there was a definite offer of a very large sum of money for this body with the definite purpose of doing propaganda to secure a proper recognition of the value of air power, and that offer, as shown by subsequent newspaper extracts which are in my possession, was in fact accepted. One of those extracts, which professes, as I remember, to correct what is said here, says that the offer was £10,000 a year instead of £5,000. I do not know which is right; but it is the principle which matters.

1355. Mr. Spender: Whom was the offer by? I did not quite follow.

Mr. Noel Baker: It was made on behalf of those interested in production of aircraft, and the name of Mr. Handley Page is here cited: "in accordance with the undertaking given by Mr. Handley Page in his letter to Lord Burnham of 17th December, 1926."

I have always thought and believed that it was extraordinarily desirable that subscriptions to "Patriotic Societies" should be made public. President Hoover, in 1930, in dealing with the American Navy League, who had attacked the London Naval Treaty, said that Patriotic Societies ought to be like Caesar's wife, above suspicion; and if all their membership and all their subscriptions could be made public it would be, as I think, an extraordinarily advantageous thing. I would, for example, explain, or, rather, prevent the suspicions which come into my mind when I read the following in the Annual Report of the Air League, 1933-34—remember that is the year, again, when air disarmament was almost successful. The Report says that the

"excess of assets over liabilities of £263 at the 31st December, 1932, has increased in the succeeding twelve months to an excess of £1,275; this is very satisfactory in view of the greatly increased activities undertaken by the Air League. Subscriptions are approximately the same as in 1932, but the League has benefited by a number of generous donations."

Donations for the year ended 31st December, as shown in the accounts, totalled £1,561.

It may very well be that every one of those donations was from wholly disinterested people, but we ought to know it, and I think it also a fact worth mentioning that the Secretary-General of the Air League, who has been in charge of its affairs during the period of the Disarmament Conference, came to his office as Secretary-General from the post of director in Vickers Aviation, Ltd., and from another post as director in a company called Supermarine Aviation, Ltd.

Throughout all this period the Air League has been very active in promoting the cause of "air power". In 1926, when Sir Samuel Hoare and Lord Trenchard, I believe, were in charge of the Air Force, there was a special protest against the slowing down of the programme for the increase of the R.A.F. It says, as soon as that was known, "the Executive Committee took active steps in the matter and a Press campaign of protest was organised." They arranged a lunch for all the principal journals of the country, and got all the editors or air correspondents to come, and they urged on them that it was frightfully important to keep a large air force because the aeroplane industry depended upon the military orders. In July of 1926 the Bulletin said that the Executive Committee had given a great deal of attention to the distribution of

government orders for aircraft, "as the existing system did not enable the aircraft manufacturers to run their businesses on economical bases. A second committee was appointed to investigate this matter and the Executive Committee are glad to be able to report that the system of giving orders has undergone a change"—in other words, the Air League intervenes in matters which concern the interests of air manufacturers between the Government and the manufacturers, and does so officially, through its Executive Committee.

There are later examples—I am taking so long, Sir John, that I pass over those rather more hurriedly than I would otherwise have done—in which I could show that the Air League has taken a very deep interest in the general support given to the aircraft industry; it expresses anxiety that the Government are forcing contractors to take too low a price for their products, which is a rather strange attitude for an air patriotic society. Of course, they justify it by saying (and it may be a justification) that if the industry is to remain strong and capable of expansion in time of war, profits must be adequate during the fat years to enable it to carry on through the lean years.

The Air League, during the Disarmament Conference, took a very active part in the formation of opinion. It carried on a campaign in favour of air bombing at a time when it was proposed by many governments—and our own Government gave a very considerable measure of support to it within certain limits—that air bombing should be abolished. Here is a circular of June, 1933, showing a summary of newspaper articles and correspondence on the subject of air bombing which had appeared in the Press. It says that a certain number, a great proportion, were written or inspired by the Air League, and it ends: "The movement against air bombing and against military and naval aircraft shows no sign of slackening." Then, in March, 1934, rather later, they summarise their campaign. They say: "The Air League was able, through the medium of the Press and through lectures, to inform the public on the rights of the case from intimate knowledge, with the result that the great majority of the Press of this country admitted that this air control"—that is frontier bombing, of course—"was both humane and effective"; and they say again, reviewing what they have done by courtesy of the daily Press and reviews and so on, that more than 120,000 words from the Air League have been presented to millions of readers. Then, of course, there have been a lot of lectures, and so on, and there have been other arguments in favour of air warfare, making out that it is not worse than other warfare. Indeed, one argument makes out that air warfare would not be so bad as the street accidents in England in a single year. There is approval of a book by Mr. Yeats Brown in favour of the institution of war. There are a number of articles against international organisation. Perhaps I might read one: "... we are told by some that to love one's country is a crime from which wars spring, that we must sacrifice the love of our quiet meadows for some pallid dream of a drab regimented international state." It is a very strange conception that we should sacrifice our meadows to Geneva. "There are those among us... who count as nothing the liberties our forebears won; who take no pride in our glories and our achievements; who offer us a cold and intellectual federation, if their dispassioned reasonings should prove correct." That is an argument against international organisation. There are arguments against the organisation of an international air police force and against the internationalisation of civil aviation.

Now, Sir John, I have said that I think it would be desirable that membership of these organisations should be made public. A friend of mine in fact tried to find out what was the membership of the Air League, and wrote and asked—he happened to

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

be a member—and the reply was that the lists were not published because of the nuisance of advertisers. I do not think that a very good objection, and I am a good deal puzzled by a circular which was sent round to members of the Air League only so recently as the 15th October of this year, signed by the Secretary-General:

"My attention has been drawn to the fact that a circular letter has been sent to Members of the Air League, as subscribers to 'Air Review,' by a firm of London tailors. So far as I know, there is only one list of our members outside this office, and it is possible that this list may have been responsible for the circularisation. If investigation proves this to have been the case, my Committee will take a very serious view of the matter, and in these circumstances you will understand my reluctance to comment at great length."

Now, I belong to a considerable number of associations who publish their lists—the Royal Institute of International Affairs, for example. I dare say that I receive some advertisements as a result—1356. *Chairman:* But why do you want their names published—simply because they do not take the same view, or what is it?

Mr. Noel Baker: No, Sir John; I am not making myself clear. Because I think that those who try to persuade the public opinion of this country in favour of armament increases in season and out of season, if I may so express it, but certainly at all times, ought not to have any connection with the industry by which those armed forces are to be produced; and I think it is desirable that the membership of such bodies—that everything to do with them—should be fully public and given to the world at large, not only their membership lists, but their subscription lists and their donation lists and all the rest; and I am hoping that this Commission will take evidence from these bodies. That is really why I have detained you so very long on the matter, because it has been known before, it has been proved, as I think, that Patriotic Societies in other countries have unduly stimulated an armament demand with most unfortunate results. President Hoover as good as said so in the case to which I have referred; and it has happened in other countries as well.

I have dwelt on it at this immense length because I do believe a searching inquiry into these bodies is in the interests of all concerned, including them themselves.

1357. *Professor Gutteridge:* May I intervene for a moment? Might I ask Mr. Noel Baker if he would define a "Patriotic Society"? I am not quite clear what he means by a Patriotic Society.

Mr. Noel Baker: Well, it is a very loose phrase, but they use it themselves. Perhaps I should be more precise—Societies which give special attention to national defence.

1358. *Professor Gutteridge:* I do not like your using the word "Patriotic" in that connotation. One might be a patriot without doing anything like that.

Mr. Noel Baker: I withdraw it. Of course, from my own point of view, I do not at all accept the use of the phrase; only it is very common in the literature of the organisations I am talking about.

In what I have said on all this, Sir John, I am making no personal charges. I believe in the integrity and the patriotism of all these individuals. Those of them whom I know I greatly respect. It is a question of system and of principle, and it is, I think, in the public interest and in their interest that they should be, as I have said, above suspicion, and that everything should be fully published. I hope, therefore, that the Commission may be able to make an inquiry into this aspect of the matter, and I think that that is particularly important at the present time, when there is a great armament expansion beginning, when contracts worth tens of millions, perhaps hundreds of millions over a period of years, are going to be given, when some of these

societies are raising special funds—I think I saw something in the Press the other day about a fund for one of them of £50,000—I think it is very important that the membership of such societies and the sources of their financial support should be entirely public.

I want to pass from that, Mr. Chairman, and to summarise what I have said. I believe that these forces did play a great part in educating the air interests, and particularly the pilots, to believe that disarmament and the League of Nations and international solutions of the air problem were all nonsense, that thereby they played a great part in defeating Mr. Baldwin's appeal to the young, because Mr. Baldwin, in his great speech, said that the matter would be decided by the young, and I think he obviously meant the young men who were pilots; and in so doing they did play a very large part in defeating air disarmament, which so nearly succeeded at the Disarmament Conference in the middle of 1933, with results which no one can foretell.

Now, Sir, I turn to the technical side of my Statement, by far the longer part, and I do not want to say very much about that, although I have made a lot of notes; but the Commission have read my Statement, and I do not think it is necessary for me to do more than summarise very briefly what I have written.

I have started by assuming that there are two hypotheses on which this matter must be considered—that of international anarchy and that of a real system of organised international disarmament and peace—and that perhaps the two different hypotheses would justify different recommendations by the Commission. In any case, I hope the Commission may take that point of view into consideration. I have gone on to argue that control as ordinarily understood—that is to say, a system of licensing and inspection—does not give adequate means of removing the evils which follow from private manufacture. How, for example, can the Board of Trade possibly tell, when it is giving a licence for a consignment of goods abroad, how the order for those goods was obtained? I do not see how control in that way is to deal with the matter at issue. I have given in the succeeding chapters, Chapter VII and onwards, a long analysis of the alleged advantages of the system of private manufacture. For example, I begin with competition and I have shown that by the nature of private manufacture there is very little international competition, because every manufacturing state always buys from its own people, and the manufacturing states constitute a very large percentage of the total world market; that there is very little competition at home, particularly in our country, where for the most part the different products required by the Services are produced by one firm only or by a small number of firms in very close relationship with each other. I have shown that in respect of a considerable number of arms and different kinds of ammunition there is no competition, even by national arsenals. I have shown that there is, as the Commission is well aware, a certain amount of international combination, and I have concluded that in fact competition is not an important factor in the armament industry, either nationally or internationally.

I have gone on to consider the question of prices, and the general burden of armament expenditure on the nation. I have had it said to me in private conversation with a person in a responsible position, who certainly believed what he said to me, that if private manufacture were abolished, it would add £10,000,000 a year to the National Budget. I believe that to be quite fantastic. I believe there is no justification for it on any ground. I believe the arguments used to support it are really based on illusions. So far as prices are concerned, there is a long experience to show that arsenal prices are not higher than private firms' prices, and even tend to be lower, and I have cited a memorandum which was put in to Senator Nye's Committee last year

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

showing that in the U.S. Army's experience their government arsenals manufacture at an average level of 11 per cent. less than the private firms. There is an important offset which I can deal with in another connection, perhaps, if the Commission desires.

Then I have dealt with the advantages, urged so strongly here by Sir Eustace d'Eyncourt, of competition and the stimulus of private gain in promoting invention and improvements in design. Here I have argued that whatever may have been true before the War, even if the Government methods were, as used to be said, clogging to private individuals who wanted to make improvements before the War, that is not true now. I have submitted that for inventions and improvements in design you need four things: you need the man with the idea, the inventor, who may be inside or outside the armament industry, the worker in the armament industry who thinks of some improvement in the thing he is working on; you need, secondly, large-scale research; you need experiment and test; you need liaison with repair work and with actual testing in the field; and you need some incentive to make people want to make the progress. Now, I believe that under a system of government monopoly, the man with the idea would go to the government, precisely as he goes to the private firm to-day, if he had the idea. An inventor is like that; he will do so. I have argued that research and experiment and testing must be better done by government than it can conceivably be done by any private firm, because the government spend such immense sums of money on it, something like a million pounds a year at the present time. I have argued that so far as liaison with repair work and field experience is concerned, the government arsenal must again, in the nature of things, be in a stronger position than the private concern. As regards incentive, I have argued that inventors do not always get the rewards of their invention, even under the present system, but nevertheless the government does now make rewards to people for inventions that are brought to it which total at least £30,000 a year in a recent year, and those rewards could be made more generous if the government desired to make greater progress; and secondly, that the real incentive now is not money at all: the real incentive is differential military advantage against the foreigner, that is what Sir Eustace d'Eyncourt called the Derby race in armaments in which every nation tries to be ahead.

Now everybody in our country is imbued with that incentive at the present time. If you were to put design in the hands of government officials only, officials of the Services—and it is principally in their hands at the present time—you would not have stagnation, you would not have the lapse of incentive, because that incentive exists in the strongest possible form; and, indeed, to say that there would be stagnation, that you would have no incentive and that the people would not try to improve, is to my mind to go very near to insulting the honour of officers and servants of the State who have very high qualifications and hold very responsible positions.

In connection with that, I want to emphasise another point which I have referred to here, namely, that in connection with this incentive of getting differential military advantage for your own country out of an invention, the Government is in a far better position by the nature of things than a private firm, because if the Government gets something really good it wants to keep it to itself, but if the private manufacturer gets something really good he wants to sell it to foreign countries as well as to his own, and for all the reasons explained by Admiral Lord Wester Wemyss. I take one example. Sir Ernle Chatfield, the First Sea Lord, told us not very long ago that sea power was as important to us as ever, and that the battleship was the full back of the Navy, on whom our safety depended. Battleships depend on their armour. Sir Robert Hadfield has invented a new shell. It is called the relieved base

shell, and in an advertisement which appears in *Brassey's Naval Annual*—I have it here if the Commission would care to see it—there is a picture of the shell and written across it "*Hadfield's latest invention—Patented Relieved Base—has solved the problem of oblique attack on armour at modern battle ranges*"; and Sir Robert Hadfield said at the annual meeting of his shareholders: "*This new Hadfield shell undoubtedly represents the most efficient shell in the world. . . . This improvement has now removed the last outstanding difficulty in the attack of armour under modern conditions*". Now if ever there was a case in which it would have been in the interests of the British Government to keep an invention to itself, there was a case. It could very easily have been done, obviously, because it is not the kind of thing which would easily get known abroad. In fact, Sir Robert Hadfield's firm, pursuing its perfectly legitimate interests in present conditions, patented that shell in eight different countries.

I take one other example—I do not want to dilate upon it because Mr. McKinnon Wood said something about it—namely, the sale of aircraft to foreign countries. Our Government has spent very large sums in recent times in promoting research in aircraft. The Air Ministry have proclaimed in an official memorandum that it is because of that research and because of the partnership between the industry and the private firms that we are capturing foreign markets in such a remarkable degree and that our machines go abroad. Now I understand from a Press statement a little while ago—it may be wrong; I hope it is—that one of our very latest single-seater fighters, with a tremendously high performance, 231 miles per hour, 20,000 ft. in nine minutes—an almost inconceivable performance—the "*Gannet*" which was entered in the R.A.F. a few months before the Royal Review, has now been given to a foreign power under licence to be manufactured there. Now that is the kind of thing which constitutes, I think, a very strange paradox which requires explanation. Another firm which is supplying the R.A.F. to-day, I think, with single-seater fighters sells them to twenty foreign countries. It means that all the result of our invention, the result of our expenditure of public money, is at the benefit of any potential enemy that we have in the world to-day.

Now I submit that my conclusion in regard to design is certainly supported by the McKinnon Wood Committee's Report,* because they urge that design should be centralised in Government hands much more than it ever has been before.

I pass on to examine the alleged advantages of the export trade, and I show that in fact the export trade is much less than is normally believed, a smaller proportion of our total output, and that the export trade which we should lose if private manufacture were abolished would almost certainly not be more than about one-ninth of the total production of armaments in this country. I can substantiate those figures, if the Commission desire, in detail, and I have argued that the loss of one-ninth of production could very easily be made up if the Government so desired at a very low cost by keeping additional reserve plant in Government arsenals standing idle, if you like. It would be a little cost, but I think it would be offset by other economies; but whatever loss of total potential reserve capacity there would be could very easily be made up with trifling expense.

Now I will turn, if I may, leaving the question of expansion (my Chapter XII) on one side for the moment, to some of the difficulties I have dealt with. There is first the difficulty of definition. Everybody remembers how it was said at one time that even children's marbles could be used as ammunition, and that therefore you could not make a sound system of abolition, because it would not be known what it was you were going to abolish. In the same

* Cmd. 229, 1919.

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

way one could reply that it is very easy to define armaments, because the armament firms have done it themselves: they have made agreements among themselves whereby certain companies are forbidden to make armaments except for those with whom they are in combination. I do not want to take that kind of line. I have argued here that there is a lot of confusion of thought on this subject of definition, that for the purposes for which most people want the abolition of private manufacture—namely, getting rid of the armament interest, which exercises an important influence in public affairs—you do not need a very elaborate definition at all. You merely need a declaration by the Government that it is not going to buy certain things, finished arms and component parts, if you like, which it lays down in a fixed list which it can settle for itself; and that it is not going to allow the export of those things. By that simple process you can, in fact, get rid of the vested interest which I think is dangerous.

A great deal of confusion has come into this subject, because in Geneva there was a lot of discussion of the abolition of private manufacture and the control of the private industry of armament manufacture as a supplementary guarantee for the observance of an international disarmament treaty; and people said: "If you are to make that guarantee effective you must prevent a disloyal state from piling up component parts and from keeping specialised armament machinery", and so on. Well, if you are to do that obviously you must have a very careful international definition of component parts and of specialised machinery, and you must have an inspection to ensure that those regulations are observed. Well, I submit in my evidence that even if you want to do that, even if you do reach the happy conclusion of a disarmament treaty and you do desire to control manufacture of armaments for that purpose, you can quite well do so, because the Allied Commissions in Germany after the War solved the problem in their definitions and their practice, and the guidance of a German law passed at their instigation will quite certainly solve the difficulties with which you would be faced.

In Chapter XIV I come to the difficulties involved in foreign trade if private manufacture were abolished, the alleged difficulties of the non-producing state, that it would be at the mercy of producing states, and so on, and I have shown that that may or may not be a sound objection, but it certainly is not one taken by the non-producing states themselves. It has been very largely used by states which manufacture armaments, but not by states which do not manufacture armaments. I think the case on that is quite conclusive. I have argued that the arguments about neutrality are mostly based on the conception that the League of Nations Covenant does not exist, and I have cited a memorandum issued by the Foreign Office in 1930, an official paper laid before Parliament, which concludes that between members of the League there can be no neutral rights because there can be no neutrals.

On the argument that inter-governmental trading would be open to grave objection, I have argued that some of the objections alleged there do already in a certain measure happen, but they happen under the cloak of the private firms, and that it is far easier for them to happen under the cloak of private firms than under government manufacture, that in fact the dangers envisaged would be much less if private manufacture were abolished than they are at the present time.

Lastly, in that chapter I have argued that if private manufacture were abolished throughout the world it would not lead, as is often said, to a great increase of government arsenals, the multiplication of sources of arms supply. I have argued that because, as I have shown, it is extremely difficult for non-industrial countries to have armament industries, and in fact private manufacturers have

already made great efforts to start private armament industries in practically every country where it can be done, and I have suggested that it may even be the case—I do not say that it definitely is—that if private manufacture were abolished there would be less likelihood of the multiplication of new sources of supply, because there would be less incentive, owing to the absence of the profit motive, to the setting up of new factories. Of course, all that turns on the view from which I start, that it is not the non-producing states who are worried about the abolition of private manufacture, that they do not mind, that they raise no objection to being dependent upon other governments; and so far as one can judge from what they have said and from their attitude in their discussions of the matter, they are quite ready to buy from governments.

On the nationalisation of the industry I have argued, as I said at the beginning, that this is really one of the simplest technical problems that a government could have to carry through. Compared with the nationalisation of the coal industry it would be child's play, for the reason that the Government already possesses national arsenals and factories and dockyards where practically all kinds of armaments are being made or have been made, and that they certainly possess the personnel and equipment to make any kind of armament whatever. I have argued that this would not make a great dislocation in the industry of the country. If it were simultaneous with a disarmament treaty, then there would be a big reduction of armaments, and those engaged in the private firms would be out of employment, but they will be in any case if disarmament is carried out. If you assume the same level of armaments, I imagine it to be absolutely certain that the Government would, or would not, as it found advantageous or otherwise, take over the plant, and would certainly take over the greater part of those they found efficient in the personnel—the managers, designers, experts, foremen and skilled workers.

I have further argued that the fluctuations of demand from time to time constitute a great difficulty for the armament industry. They make it very unsatisfactory for private manufacturers to be in it. No man in his senses could want to be in an industry which had an immense expansion for a few years, then the immense over-expansion of a war, and then a period of stagnation for 10 or 15 years, as has just happened. It is a very unhappy industry to be in in many ways. But I have argued that that risk of fluctuation is one which ought in the nature of things to fall on the government because it results from government policy, namely, the scale of armaments which is maintained, and therefore the difficulties of that ought to fall on the government, and that in fact under a system of government monopoly the difficulties due to that cause would probably be rather less than they are under the existing system.

I have summarised a great deal very briefly, Sir John, and I turn back to the question of the expansion of armaments. I regard this question of expansion as by far the most important argument that is used in favour of the retention of the present system. It is the argument which makes people say that the private firms are vital to our national defence. It is the argument which makes them accept all sorts of results which on other grounds they object to—the selling of secrets to foreign powers, the arming of potential enemies, the paying of higher prices, and so on. Those things are accepted because they believe that the more firms you have, the more centres of production you have, the greater must be your power to expand armament production when a crisis comes. It looks like a perfectly natural and self-evident proposition, and it is very persuasive to very many people, and I used to accept it almost without examination.

But if one thinks about the matter carefully, one is forced to the conclusion that the capacity of expansion at a time of crisis depends upon the armament plant which the country maintains in time

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

of peace, and that that will depend firstly upon the amount of plant used in government production in time of peace for current annual needs, and, secondly, upon the amount of plant which the government chooses to maintain in idleness in time of peace. Now the private manufacturers do not maintain reserve plant in idleness in time of peace: it is paid for by the government. If any of the burden falls on them they complain about it. Perhaps occasionally some of the burden does fall upon them, but, broadly speaking, the government pays for it. Broadly speaking, therefore, under a system of government monopoly, the plant which exists for annual production and the reserve plant which exists in idleness at government expense will be the same, and the real question about expansion, therefore, is: Will your power of expansion be greater if that plant is in private hands or if it is in government hands? And that reduces itself, as I have suggested in a certain paragraph early in Chapter XII, to three questions: Do you think that a national arsenal would be able to expand less rapidly than a private firm? Secondly, do you think that a government arsenal would be less able to instruct the ordinary engineer outside, the average general engineering resources of the country, than a private firm? Thirdly, would a government arsenal or a government department be less well able rapidly and efficiently to make new factories in time of war than a private firm would be able to make them?

Those are the three questions. Now on all those questions, on grounds of theory and on grounds of experience, I venture to think that the advantage lies with government departments. The figures are very unsatisfactory. I do not think anybody could get better figures than I have produced in my Chapter XII. So far as they go they do show that government arsenals expanded at least as quickly as private firms in 1914. The Murray Committee of 1907 thought they were going to, and although, as the evidence shows, the Arsenal was not very well prepared for expansion, I think in fact the Murray Committee's prediction was borne out, and that they did expand at least as rapidly, if not more rapidly, than private firms. In the second place—

1359. *Chairman:* May I interrupt a moment? They did not have the same difficulties quite, did they, as the private firms?

Mr. Noel Baker: No; precisely, Sir John; and I am coming to that. Perhaps I may deal with it now, as you have raised the point. I think the firms have been treated very unfairly by a great number of their critics. People argue as though the private firms had been guilty of the utmost wickedness and rapacity in 1914. Well, I do not justify everything that the private firms did—very far from it—but their difficulties were enormous. No one in the government had told them what kind of expansion they were to expect. The War Office had not the slightest idea that there was going to be any such expansion. How could the private firms have had it? They had mostly been working for the Navy. The Navy did not have such an expansion, and did not require it. In the second place, about their prices, certainly the prices, as the *History of the Ministry of Munitions* shows, were fantastic; but what were the private firms asked to do? They were asked to invest an immense new capital in new factories; no one could tell them how long the War was going on; lots of people said it would be over by Christmas; Lord Kitchener said three years. What were they to do? They had to guess between the two. The private firms could not know how long it was going to last, and they knew the Government would not give them a single order after it stopped. They had to invest their shareholders' money and take a risk of getting it back before the War ended. Well, I think in those conditions it is extremely unfair, for the most part, to attack the private firms in the way they have been attacked, and my case against the way things were worked in 1914 is not against the private firms; I think many of them did

admirably from their own point of view, and certainly had a most miraculous record for armament output before the end of the War. They were greatly helped by government control after 1915, it is true. But my case is that the system was wrong, and, as you say, it was not their fault. Certainly it was not. It was because they had been asked, under the system, to do things which private firms could not possibly do. That is particularly true of this second matter which I am now going to deal with—the instruction of the ordinary engineering firms, the industrial mobilisation, as we now call it, of the general engineering resources of the country. That is the real reserve of manufacturing power, of armament output, as the McKinnon Wood Committee said in their Report. That is the real reserve, the vastly important reserve, and therefore that is the most important thing. Now in 1914, under the terms of the report of the Murray Committee, that task was entrusted to the private firms on the Admiralty and War Office lists, and they were given great advantages for carrying it out. I have a section summarising the way in which this experiment was tested, the length of time for which it was tried after there was the great public outcry about the privileges the firms were given, and so on; and yet they totally failed. They could not do it, firstly, because their method, which was the method of sub-contracting, completely broke down. It broke down for a number of reasons, of which one is of great interest, namely, that the profit motive was in conflict with the motive of patriotism. The worker did not want to go from the firm where he was, to an armament firm, to get an ordinary wage, when the armament firm was, as he thought, going to make an immense profit. The ordinary engineer did not want to take a sub-contract for a private firm which was going to make an immense profit on it when he would much rather have done it for the government itself. And it is true that the demand for the change came from the ordinary engineers themselves, who revolted against the system of restricting the expansion to the private firms, and I suggest for the information of the Commission a very interesting chapter in the biography of Mr. Crittall on this subject.

It was not only sub-contracting that failed. Sub-contracting was the method, and when it had failed there was not much hope that the private firms could mobilise the engineering industries of the country. But in addition to that, the mobilisation of the engineering resources of the country involved inherently doing a number of things which could only be done by government—mobilising the general resources of labour, securing the dilution of labour, making a pool of labour, making a pool of raw materials, making a pool of our machine tools, organising the distribution of the supply of machine tools, sub-dividing industrial processes in a very high degree so as to facilitate dilution of labour and a greater use of newly-invented machine tools, and the co-ordination of supply. In all those ways, which were vital to large-scale production, it was impossible for private firms to do what the situation demanded; and therefore I say—and I do not believe there is any government expert or anyone else who will contradict this—that no one would dream to-day of leaving industrial mobilisation in the hands of private firms, as it was left in 1914. Everybody would say: "Of course, we must have direct central organisation, as we had after 1915."

On the third question, the building of new factories which were required because neither existing arsenals nor existing private factories could supply the whole of the war needs, the success of national factories was so clear in its results that I do not say much about it—Dr. Addison talked about it at length. But I do recite a story of the Norton Metal Company from the *History of the Ministry of Munitions*, which I recommend to the attention of the Commission.

The broad general conclusion from that is that expansion in time of war will be carried out far

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

better if the armament plant and the skilled personnel are in the hands of and under the control of government; that the cadre for securing the instruction of ordinary engineering firms will be far greater, and the preparation for using that cadre far better, if it is centralised in government hands; and that therefore this argument for expansion, which is the chief argument by which the system of private manufacture of armaments has been defended, falls to the ground.

As I have submitted, I hope not in conflict with the views of the Commission, on that point the findings of the McKinnon Wood Committee bear out my conclusion. Now I ask the Commission to note very particularly what I have said. I have not said that the McKinnon Wood Committee reported in favour of the system of government monopoly and against the system of private manufacture. I have not said that. They were not asked to report upon it and they did not. But I do say that their report shows that if you have to choose, as they had to choose in 1919 (at least in their view) between the maintenance of government arsenals and the maintenance of private firms, then it was to the interest of the nation to keep the government arsenals and let the private firms go. They said repeatedly in their report they thought these firms would disappear. They reached that conclusion particularly for two reasons, if their report is read with care, first that for progress in design it is essential that it should be centralised in government hands, second they show how it is essential for securing quick expansion in time of crisis that it should be in the hands of government arsenals. I submit, therefore, that authority bears out my contention that this major argument in favour of the present system falls to the ground, and I submit that the authority of the McKinnon Wood Committee is very high. I understand that Admiral Bacon is going to give evidence to-morrow. I should adhere to my view of his report even if he were to say that the report was in favour of private manufacture.

1359. *Chairman*: Well, that is quite candid!

Mr. Noel Baker: But I think if it is read in the light of the circumstances and with great care to balance one paragraph against another, and to see how the purpose emerges from the terms of reference onwards, the conclusion is really plain.

Well, Sir John, that ends what I want to say. I only add one final word. The Commission may have heard people say that the abolition of private manufacture is an immensely difficult thing to-day, especially when you propose to combine it with an elaborate national and international control of the trade, and so on. I would reply that it is an illusion to think that the "simpler" plans are easier to work in questions of armament. I have been engaged closely in armament discussions ever since 1921, and I have come to the very clear conclusion that although it sounds like a paradox, the more drastic solution is always in reality by far the simpler; that when you try to get a compromise or a half-solution which goes a little of the way, it does not create confidence and therefore in fact it will not work, probably will not even be accepted. It is the drastic solution that is likely to be accepted once you make the decision, and which will give the results when you have got it.

I would finally say that no one is so well aware as I am of the deficiencies of the private student for dealing with these complicated technical matters. I have tried to suggest lines of thought to the Commission which I hope they will be able to follow up, because I do think it is of extreme importance that policy ought not to be determined by arguments which are insufficiently examined, and which are, in fact, fallacious, in a matter which, as Mr. Baldwin so often says, may involve the life and death of western civilisation.

1360. *Chairman*: I would like to begin at the beginning, if I may—not at the beginning of your Statement, but at the beginning of my train of thought—

and the first question I want to be quite sure about is this. You do recognise in this Statement, do you not, that there is a legitimate use for armaments? For instance, in Chapter V, paragraph 22 you say: "*The purpose of national armaments in the modern world, as determined by international treaties, is to preserve peace and to secure the safety of national territories from invasion*". That is a legitimate purpose, and for that purpose, of course, it is necessary that the armaments should be produced somehow and somewhere?

Mr. Noel Baker: Yes. I have never been a unilateral disarmar. I think government rests on a certain measure of force.

1361. *Chairman*: Now, there are three possible systems under which the necessary armament may be produced. There is the system of production by government alone, government monopoly; there is the system of production by government in their arsenals and by permitted private manufacturers; and there is a third, the system of production by private manufacture alone. Now, I think we may rule out the third altogether, and we therefore have to consider the choice between the first and the second. Well, now, it is right, is it not, that in this Statement of yours you have drawn a distinction between production in time of war (and I would add great national emergency) and production in time of peace?

Mr. Noel Baker: Yes.

1362. *Chairman*: Now, am I right in saying that in time of war (and in time of great national emergency) what you suggest is to be found in three passages of your Statement to which I will refer you? The first is in paragraph 79, under head (c). It begins—and I will read it, if I may, because I think it is important—

"It is, on the contrary, assumed that the Government would, directly war broke out, carry through an industrial mobilisation of private industry, as it did during the last war. In so doing, it would no doubt take whatever measures might be required:

(i) To secure effective Government control of all armament production.

(ii) To limit the profits made by private manufacturers.

In other words, there is no suggestion that all armament production should be confined to Government Arsenals in time of war; on the contrary, the abolition of Private Manufacture in time of peace would not affect the fact that the general engineering industry of the country would furnish the same reserves of non-specialised plant as it would if the present system continued."

Then would you turn, please, to paragraph 113, at the end. You say:

"I will attempt to answer these questions in the light of British experience before and during the War. For this purpose I will base the discussion on the assumption—on which all my evidence is based—that in order to meet the needs of the nation in future war it would be necessary both to expand Government arsenals to their maximum capacity, and to bring into armament production the whole of private industry that is capable of making the necessary adaptations in its plant."

Now you see there, you confine your recommendation to the reserves of non-specialised plant, and that, I assume, means that you are assuming that there would be a government monopoly under which all specialised plant would be in the hands of the government; and in the event of war you are advocating this method of control which would cover the rest of the field; the government would have the specialised plant and the private firms would have the non-specialised plant; and in addition you further, in paragraph 193a, are advocating that the necessary preparation should be made beforehand to

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

enable that control to be put in active operation as quickly and as efficiently as possible. But if you suggest or advocate, in the event of war, the adoption of this system of control to come into immediate operation, you would necessarily, would you not, advocate the necessary machinery being set up beforehand to enable that to be done as efficiently and as quickly and as effectively as possible?

Mr. Noel Baker: Yes.

1363. *Chairman*: That would mean a census of all the non-specialised plant and all the rest of it?

Mr. Noel Baker: Yes, Sir John. Broadly speaking, my point of view is this. I am in favour of an international treaty of disarmament if it can be obtained. If, under that system of disarmament, it was decided to abolish private manufacture and to prevent industrial mobilisation and to have an international inspection to see that industrial mobilisation was not carried out, I would be in favour of our country strongly observing that agreement; and I think, as the French think, that it is possible to argue—I do not go so far as the French do on that point—that it might be a serious guarantee against the danger of aggression. But if, as I am here assuming, we are considering our armament policy, as we do to-day, on the hypothesis of international anarchy, with no disarmament, then obviously you must have industrial mobilisation. If war occurs you will certainly have it. If you are going to have it, prepare it in time of peace. I believe that the machinery for preparing it in time of peace to-day, as Dr. Addison argued, would be virtually the system of the Ministry of Munitions in the last war, the same kind of organisation, whatever you might call it. I think that that is not open to the objection that exists against the system of private manufacture, because you are not creating a definite vested interest in the increase of armaments. Therefore I would not for my part care how far industrial mobilisation was carried so long as we go on in conditions of international anarchy. I would like to say perhaps one safeguarding word. My own view is that if war broke out, probably the right plan would be the conscription of private industry, not only the control that I have suggested here, but definite conscription. However, that is a different point, and it is not really relevant to what I say because the main point I wanted to put before the Commission was the desirability of not having private manufacture in time of peace.

1364. *Chairman*: Yes. Now we have got to deal with the problem in time of peace. You have dealt with what is to happen in the event of war. Now, the choice lies between government monopoly, and government manufacture in addition to private manufacture, or private manufacture in addition to government manufacture. Now, I find in paragraph 179 of your Statement, under head (c), that you say:

"The same point may perhaps usefully be re-stated in another way. Wherever it is possible profitably to create an armaments industry, the great private armament manufacturers of the world have already done so. Their task has been, of course, facilitated by the Governments of the world, for very many Governments accept the doctrine that the possession of an armaments industry is an important factor in national defence."

That means private armament industry, does it not? You are referring there to a private armament industry?

Mr. Noel Baker: No, Sir John, I meant an armaments industry, either government or private; that a good many governments do accept the view that if you can have an industry on your own soil, whether government or private, it is desirable to have an industry, because by having the output of arms on your own soil you make it easier for you to supply your troops in time of war.

1365. *Chairman*: I read that as your view that very many governments accept the doctrine that a private armament industry is an advantage.

Mr. Noel Baker: I am afraid that that was a clumsiness of my expression. I meant having the production of armaments on their own soil, whether in government arsenals or not. If I may add one word, I would cite the way in which the Polish industry was built up by Schneider, as stated at the end of that same paragraph. In fact, I believe it to be the case that the Polish Government have largely bought Schneider out and have nationalised their armaments industry to the extent of 60 or 70 per cent. I am afraid I have not got exact figures, but I think that is substantially right.

1366. *Chairman*: Very well; that clears up my difficulty about that. Now to go back to a point that you have already referred to, the objections to a private armament industry, that is on the first page of your Statement, and I think you emphasise there that really the argument against the industry is not strengthened by referring to these various objections individually; but your point is that your real objection to the industry is that it is founded on private profit?

Mr. Noel Baker: Yes.

1367. *Chairman*: Well, now, I want you to deal with what is a difficulty in my mind. Assume that private industry is abolished. It follows, does it not, that the manufacturers of arms will be the various governments?

Mr. Noel Baker: Yes.

1368. *Chairman*: And I think you express the opinion, when you are dealing with the smaller states and the non-manufacturing governments, that there is no reasonable probability that they will ever start manufacturing for themselves?

Mr. Noel Baker: Well, I said I think they will find it very difficult to do so. Most of them who can, have done it already.

1369. *Chairman*: Well, there is no reasonable probability that they will do it?

Mr. Noel Baker: No, I think probably not.

1370. *Chairman*: Very well; then it follows from that, that assuming the abolition of the private manufacture, the manufacturers of armaments will be the greater nations and the industrial nations?

Mr. Noel Baker: The industrial nations, yes.

1371. *Chairman*: The industrial nations. Now, do you eliminate from your consideration the fact that when the manufacture of armaments is in the hands of those industrial nations, some of them will consider it advisable to manufacture for a profit?

Mr. Noel Baker: Well, I think it unlikely that they would try to make much profit out of their customers.

1372. *Chairman*: Yes; but supposing they make any profit, are not the objections that you so strongly feel against private manufacture equally great against the profits made by government manufacture? What is the difference, except that the people who reap the advantage of the profit are a different class? In the one case they are the taxpayer, and in the other case they are the private shareholder?

Mr. Noel Baker: Well, I think the difference is fundamental. The private manufacturer of arms has no other interest in the matter except to make a profit. The government has immense interests in armament policy. It has the national security to consider, it has the level of taxation to consider. If it pushes up armaments abroad, as Lord Wester Wemyss argues, armaments at home will rise in corresponding scale. If it is actively promoting the sale of arms in other countries it always does, it must, mean a general rise in the level of armaments. That will mean a rise in their armament bill at home, and their taxpayers will very soon see that while they have been making, say, a £5,000,000 profit—and that would be enormous—on their sales abroad, they have to face a £25,000,000 rise in their armament bill at home. Well, that the public would never stand. I submit in my Statement that it would be desirable that this country should abolish private manufacture unilaterally, acting alone. I cannot conceive that we would do it without a national arms

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

board to conduct sales, whether at home or abroad; that that would be conducted, in all its procedures, in the fullest possible publicity; and that public opinion would never tolerate our government trying to increase armament sales abroad. Now, if it is not abolished alone here, it would be abolished by international agreement and as part of a disarmament treaty, for quite certainly you will not get it done by international agreement without a disarmament treaty. In that case there will quite certainly be a system of inspection and control of the kind which was proposed in Geneva and very elaborately discussed. Under that inspection and control, this kind of manoeuvre of a government to try to increase its sales would certainly come to light absolutely at the beginning.

1373. *Chairman*: Yes; but you are assuming international agreement, are you not?

Mr. Noel Baker: Well, I do not think it will be generally abolished without. That is my point. Until you have a disarmament treaty you will not get general abolition; and therefore, if you put as a hypothesis general abolition, you are entitled to put as a hypothesis international control and inspection as well. Therefore I think that objection cannot arise, because the publicity will kill it. In other words, to summarise, I think the governments have an interest not to increase their profits, indeed a much more powerful interest to decrease their profits; and if they wanted to do it, they would not be allowed by public opinion in this country to do it if they were acting alone, or by international agreement if they were acting in concert with other governments.

1374. *Chairman*: Later in your Statement you use this expression, which appeals to me, that one has, in considering which of the two systems is to be adopted, to consider the "balance of advantage." In paragraph 38 you use the expression "the balance of advantage," and that is what one has to try and ascertain, is it not—the balance of advantage?

Mr. Noel Baker: Yes.

1375. *Chairman*: Now, in trying to arrive at that balance of advantage, there are three main matters which a government must take into consideration.

(Adjourned for a short time.)

1382. *Chairman*: Will you turn to your Chapter V? In paragraph 24 you say: "*But since such agreements have not yet been made, every Government feels itself obliged to apply in armament policy the principles of the system of international anarchy.*" That is the term you apply to the existing state of things. That is right, is it not?

Mr. Noel Baker: The existing state of things is a mixture between the League of Nations system and international anarchy; because the 57 governments, including many of the principal governments of the world, have accepted the Covenant and the Kellogg Pact, and therefore they are no longer living in the condition of international anarchy. They are bound by the provisions of those documents. Our own Government is never weary of asserting to the world that our policy must be based upon the principles of the Covenant and the Kellogg Pact, and I am sure they are translating the wishes of the people. But on armaments policy there are different considerations, because the provisions of the Covenant, which stipulate for the reduction of armaments to the lowest level consistent with national safety and international obligations, have not been fulfilled, and therefore so long as they are not fulfilled, and there is not that international limitation of armaments, governments are in effect in a condition of international anarchy so far as armaments are concerned; but that whereas in matters of declaring war or in action restraining war they are certainly bound by the provisions of the Covenant and the Kellogg Pact, and therefore not in a condition of international anarchy, with their actual preparations for

There is first the moral question. That has to be taken into account, has it not?

Mr. Noel Baker: Yes, I think it has.

1376. *Chairman*: Then the safety of the nation?

Mr. Noel Baker: Yes.

1377. *Chairman*: And the pocket of the nation?

Mr. Noel Baker: Yes.

1378. *Chairman*: Those are the three main questions to be taken into account, are they not, in arriving at the balance of advantage?

Mr. Noel Baker: Well, there is also the political importance, Sir John, of private manufacture. I argued that the political importance is greater than the moral importance. If it is true that the armaments interest is a factor which does obstruct the working of policies of peace, that must be so.

1379. *Chairman*: Yes. You have spoken about unilateral action by this country. Do you think that the abolition of private manufacture of armaments in this country would have any appreciable effect upon the amount of armaments produced in the world?

Mr. Noel Baker: No, I do not say that. I do not think in itself it would.

1380. *Chairman*: No; and therefore it would have no direct influence upon the question of peace or war, would it?

Mr. Noel Baker: Well, I think it would have had if it had been abolished ten years ago.

1381. *Chairman*: Yes; but now?

Mr. Noel Baker: Yes, even now, because I do not think that we have finished with disarmament discussions. I feel that it is quite certain that whatever government rules in this country, it will as Sir Samuel Hoare said in September in Geneva, take up the question again and try to get results; and therefore, so long as this political interest exists, and so long as there is a chance of disarmament at all, I think it is essential that we should try to get rid of private manufacture; but it is precisely for this reason, that we cannot know whether we are going to get disarmament or not, that I suggested that the Commission might make two sets of recommendations, one based on the hypothesis of international anarchy and the other based on the hypothesis of a system of international disarmament.

war, if it comes, they regard themselves as being in this condition. That is what I meant to say.

1383. *Chairman*: Then in paragraph 25, you say: "*So long as foreign policy is founded upon the expectation of war and the pursuit of military advantage in war, then the moral aspects of Private Manufacture will remain of secondary importance.*" That is carrying out what you said earlier in this Statement about the position until you arrive at the stage of international agreement. Is not that so?

Mr. Noel Baker: Yes.

1384. *Chairman*: I wish to read the end of that paragraph, because it seems to me to be important:

"In other words, the conditions of the two rival systems of international anarchy and organised collective peace and disarmament differ so fundamentally that it may clearly be possible that measures for dealing with Private Manufacture which ought to be adopted under the one system may be undesirable or impossible under the other."

When you say it ought to be adopted under the one system, you are referring to the system under which there has been some form of international agreement?

Mr. Noel Baker: Yes.

1385. *Chairman*: Then you go on:

"In the evidence which follows I propose to argue that even if His Majesty's Government are unable in the near future to secure an international treaty for the Reduction and Limitation of Armaments, including a stringent system of supervision

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

and control, it will nevertheless be to the advantage of the nation that they should abolish Private Manufacture of armaments on British territory."

When you speak there of advantage to the nation, are you referring to the pecuniary advantage wholly or partly?

Mr. Noel Baker: I mean advantage of all kinds; I mean what you, Sir John, referred to earlier, the balance of advantage taking all the arguments on both sides.

1386. Chairman: Very well. Then you go on to say lower down:

"In other words, I submit that the Commission should consider the problem of armament manufacture on two hypotheses:

(a) That of a collective system of the kind which His Majesty's Government is endeavouring to create, including a Disarmament Treaty, full publicity for armaments, and international supervision and control; and

(b) The conditions of international anarchy upon which armament policy at the present time is in fact determined;

and that they should make recommendations for action by the Government appropriate to the differing conditions which these two hypotheses involve."

It is conceivable, is it not, that under present conditions some substantial time may elapse before hypothesis (a) becomes a reality?

Mr. Noel Baker: It certainly is.

1387. Chairman: That is what I wanted to ask you about that.

Mr. Noel Baker: With great respect, I do not think it ought to be abandoned. That is what I mean.

1388. Chairman: No, no. Then will you turn to paragraph 32. You refer there, and in other parts of your Statement, and insist upon the necessity, if there is any international agreement, that it must be an agreement controlling not only quantity, but quality?

Mr. Noel Baker: Yes.

1389. Chairman: That, of course, increases the difficulty of coming to an agreement, does it not?

Mr. Noel Baker: My judgment on the proceedings of the Disarmament Conference was that it would have been a good deal easier to come to a qualitative agreement than to a quantitative agreement. In fact, on a number of types of armaments a great many governments were agreed on abolition of that type—heavy capital ships, tanks, and so on—but when it came to numbers, when you had to allocate the respective strength of the different nations, this terrible question of ratio, then you really were face to face with a great difficulty. I think it could have been solved. There were some very important delegations at Geneva which took the view that it was easier, as I thought it was, to get agreement on the abolition of certain weapons, kinds of armaments, rather than on actual quantity. It was essential to have both, in my view, and I think that in the end, if the thing had succeeded, there would have been both.

1390. Chairman: Will you now turn to paragraph 38: "Quite apart from the question of interest, it is inconceivable that a government should take the responsibility of arming an aggressor or indulging in illicit trade." Is not that too sanguine a view? We are not only speaking of our own Government there, but of all the governments.

Mr. Noel Baker: I quoted a practical example, and I should like to say this, although it is a repetition. The Italian Government is now engaged in aggression, and the fact is that the Italian Government is not one of those that one would have expected to be most scrupulous in this matter. Yet in fact the Italian Government was extremely anxious to disclaim responsibility for the despatch of

armaments to Hungary which was discovered a little time ago, and did push off its responsibility on to private firms.

1391. Chairman: I do not want to refer to any government by name; but is it not too sanguine a view to assume that everyone is going to behave as we should behave?

Mr. Noel Baker: I think that the responsibility on a government definitely sending arms to an aggressor is one which no civilised government would in fact take. I adhere to that view, although it sounds very extreme. I speak after considerable experience of publicity on these matters in Geneva. I really think that the governments would hesitate very seriously before they violated their pledges under the Covenant and took responsibility for so doing.

1392. Chairman: In paragraph 44, heading (e), you make use of an expression which other witnesses have made use of, and which I do not understand. Where people speak of "vertical" as well as "horizontal" combination. What does that mean?

Mr. Noel Baker: I think that when firms work among themselves they call it horizontal—when firms making identical objects (that is to say, objects of immediate use; shall we say, machine guns or rifles) co-operate in fixing their prices or work together in other ways—and they call it vertical when firms which manufacture the steel from which rifles are made, and firms which make the component parts of rifles from that steel and the manufacturers of the rifles themselves, all join in the combination, so that it is all one concern from the raw material to the finished product.

1393. Chairman: In paragraph 11 you refer to Mr. Mulliner's diaries as having been published in *The Times* in 1910. Is that the material upon which you class him amongst the undesirables?

Mr. Noel Baker: There is a good deal of other material besides that which he supplied himself. There has been a good deal of correspondence on the matter. There were a great many articles in the Press at the time, and it was discussed a great deal in works written subsequently to the War.

1394. Chairman: Have you a copy of those diaries?

Mr. Noel Baker: I certainly have got extracts from them. A file of *The Times* would show it; I have seen them and I have read them.

1395. Professor Gutteridge: The diaries have never been published as such, have they? I was under the impression that he wrote articles for *The Times* and cited from diaries which he had kept. But I am not sure about that.

Mr. Noel Baker: I think that is right.

1396. Chairman: Now Chapter XII. When you are discussing the private manufacture of arms, the question you keep asking is: Will a government arsenal or a private factory expand the more quickly? But is not the question for consideration really this: Will the government arsenal, with the assistance of private factories, expand more quickly than the arsenal by itself? It does not help one to deal with an arsenal and a factory when you are considering the question as between an arsenal by itself and an arsenal plus factories, does it?

Mr. Noel Baker: I start from a given amount of plant in a government arsenal or a private factory, and it follows from the premise which I tried to put this morning that, given a certain armaments expenditure by our country, given a certain level of armaments, the amount of plant engaged in making armaments will be approximately the same whether it is in a private factory or whether it is in government arsenals, leaving out of account the £4,000,000 export of which I spoke, which is a very small matter—£11,000 a day—in output, and which can easily be dealt with by other means. Leaving that out, the amount of plant in a government arsenal will be the same, and must be the same, if you have the same

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

armaments output, as it is if you have a system of private manufacture. Therefore the question you have to ask, if you are making comparative expansion the subject of your inquiry, is: With that given amount of plant, will the expansion be more rapid if that plant is in a government factory, or will it be more rapid if it is in private hands? The answer to that question, to my mind, does not turn on the ground of the comparative efficiency of national or of private production in general; it is different. In respect of things which are quite special to the armament industry and to military preparation a national arsenal has advantages for quick, rapid, immediate expansion; and I think myself it was shown in the War that the national arsenals were able to expand more and ask their workers to work longer hours and make greater sacrifices than the private firms were able to do, because there was not any question of private profit; it was directly for the benefit of the nation immediately, and so on. I think that for those reasons it was shown in the early stages of the War—and it is only the early stages I am dealing with there, the plant in existence when war begins—I think it was shown that a given quantity of plant will allow bigger expansion in government hands than in private hands. The question of the rest of private industry, the general engineering resources of the country, comes under my sub-paragraph (b) in paragraph 113; that is: Is a private firm better adapted than a government arsenal for carrying through what we now call industrial mobilisation?

1397. *Chairman*: You are speaking there, of course, of plant; but so long as the export of armaments is permissible you have to consider not only the plant, but the plant as part of the actual working factory, as it were—the man-power, and so on?

Mr. Noel Baker: I admit that there would be a diminution of skilled man-power and expert management engaged in making that £4,000,000 worth, supposing we lose it all. I do not necessarily accept the view that the non-producing states would not buy from a government arsenal here; I think it is very likely they would. Assume, however, that we do not want it in any case, that you have that loss of £4,000,000, there would be a certain diminution in the number of skilled workers and skilled management engaged in armaments production; but I believe, when you come to the expansion question and examine it closely, that that loss would be more than offset by the greater efficiency of the government in instructing the non-specialised industries in armament manufacture; in other words, that the cadre of the government factories would be larger owing to the fact of having a government monopoly, and that the increase in that cadre of people who could carry through the industrial mobilisation would more than offset the loss of the skilled personnel engaged in making the £4,000,000, the one-ninth, which goes for export.

1398. *Chairman*: With regard to your reference to the McKinnon Wood Report at the end of Chapter XII of your Statement, what materials have you upon which you founded your view of the McKinnon Wood Report; had you this evidence as well as the Report, or only the Report?

Mr. Noel Baker: I only had those extracts from the evidence which have been published by Dr. Gilbert Slater in 1922, in a pamphlet called *War or Peace*. I may say that I made great efforts to get the evidence because I thought it must have been published, but I have never succeeded, and I understand now that it has not been published; but Dr. Slater did quote important extracts from it, and it is from him that I have re-quoted them. I think I have indicated that in the footnotes.

1399. *Chairman*: You see, in your paragraph 149 you draw an inference about what the Committee intended, although they did not say so in words: "If

they chose to recommend that Woolwich should continue, and be given work, they were in reality proposing that the other sources of production should be closed down, unless by express reservation they made it plain that means should be found to keep these other sources in existence." Of course, it is a question of inference, but I have read the Report and I have read the evidence, such as there is, and the inference I have drawn is that they were directing their attention mainly to Woolwich, and they definitely decided that Woolwich was to go on and be increased and improved; but that the expectation at that time was that the amount of armaments (using the word generally) to be manufactured would be so small in the future that the private firms would die of inertia, and that that is all they were referring to. But you do not take that view?

Mr. Noel Baker: No.

1400. *Chairman*: You have not seen the evidence?

Mr. Noel Baker: No, I have not seen the evidence; I have only seen those extracts; but I do not think I differ substantially from their view. I have the Report here in my hand, and it starts with the heading which I quoted: "*Armament production after the War; Government Arsenal and Private Factories*", and when they say as you have just said, that there is only a limited demand and it will be a very small demand. They go on to say that for that small amount it will be necessary to have some source of production, and that "*therefore a factory or factories either owned by the Government or private trade will be required for this purpose*." Then they say that the arguments in favour of the retention of a government arsenal in peace-time are overwhelming, and they proceed to cite the arguments:

"Assuming, therefore, that a Government factory is kept in existence, and that the supply of armaments is greatly reduced in quantity, it more or less follows that the present outlay of the larger private firms for armament production will be considerably reduced, and such manufacture will not improbably disappear as a speciality. It is also probable that the country will insist on the production of all armaments being confined to Government factories; nor would the disappearance of the larger armament firms materially handicap production in the event of a serious war."

My submission is this: that, having considered the whole case for all the sources of supply which then existed—the pre-war government arsenals, the pre-war private firms, the new national factories built during the War, the firms which grew up during the War—this Committee decided in favour of the pre-war government arsenals, having to make a choice, thereby deliberately leaving out private manufacture; and they did so although one witness who came before them—Sir F. R. Bingham, a member of the Munitions Council—I cite this in paragraph 152a—had definitely proposed that private firms should be kept in existence by means of subsidy; he recognised that they could not live on their own merits, and he wanted to subsidise them. I think it very striking that, whereas the policy of the Government when war broke out was that of the Murray Committee, namely, to increase orders to private firms as much as you could and to cut the government arsenals down to the absolute minimum—so much so that an immense reduction was made in the years between 1907 and 1914 with regard to orders to government arsenals while the orders to private firms were enormously increased—after the War, in 1918-1919, these men, who had had this immense experience of armaments production, rejected this proposal of subsidies for private firms; they ruled it clean out, although they thought it meant the disappearance of the private firms. They did not say that private manufacture was wrong, or inefficient, or anything else. I only argue that they said it was not important for the expansion of armaments production at the beginning of a war, nor for the purpose of promoting progress in

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

design—the two main arguments which are alleged in favour of the present system, and which I understand have been alleged before this Commission. They rejected those arguments and said it was essential to keep the government arsenals in existence for that purpose; not only for that purpose, but that every effort should be made to give as big orders as possible to Woolwich for that reason, including all sorts of things which Woolwich had not made; for instance, mechanical transport for the armed forces; even, I think, marine engines for warships. So that my submission is that the McKinnon Wood Committee, with its immense authority, rejected the argument that private manufacture is essential for progress, design and expansion, and that it said that the continuance of government manufacture was essential. That is all I say; I do not go beyond that.

1401. *Chairman*: There is only the evidence of Major-General the Hon. Sir F. R. Bingham, who gave evidence before that Committee, and this occurs in the note of his evidence, because the only record there is, apparently, of the evidence, is some notes which were taken by the secretary in shorthand and reproduced. The General, amongst other things, recommended that some of the armament firms should be maintained, possibly by means of a subsidy, in a state of readiness to produce munitions immediately a war was imminent, and that, with the exception of one or two, national factories should be closed down and left dormant, their machinery being stored. That piece of evidence gives rise to this statement in the secretary's record: "*The Committee discussed these questions, and the views were expressed (a) that the annual estimates for munitions after the war would be so comparatively infinitesimal that the armament firms should not be expected to keep going on munitions work, and that future Parliaments in all probability would not permit of subsidies being granted.*" It seems to me that the Report has reproduced, in other words, that opinion of the Committee. But there it must rest; you do not agree; that is all.

Mr. Noel Baker: If I may add this. I continue, in paragraph 152a, by saying that if the Committee had thought the existence of private firms to be important for the expansion of armaments production they would surely have recommended—Parliament might have rejected it—a system of subsidies for private firms. It would have been their immediate duty. I cannot conceive that a Committee called on to report in the very gravest conditions at the end of the War would not have made such a recommendation.

1402. *Professor Gutteridge*: May I put a question on this? I think that one of the reasons why they did not recommend the continuation of the private firms as a source of armaments supply was because they pointed out that there was such a large reserve of what they called trained labour in the country, men trained in making munitions, that it was no longer necessary to have private firms for the purpose of training these men. I think that was another point which they stressed?

Mr. Noel Baker: Yes.

1403. *Professor Gutteridge*: In other words, the conditions were rather abnormal just at that moment.

Mr. Noel Baker: That is quite true; and, of course, I admit that in that sense that diminishes the purport of their conclusion.

1404. *Professor Gutteridge*: It lessens the cogency of it.

Mr. Noel Baker: I would submit this in reply: The amount of trained labour in times of peace is going to depend, like the amount of plant, on armament production, and that will not differ whether the production is under government monopoly or under private firms, except for that amount of export, the problematical £4,000,000. Otherwise, it does not differ; it is the same; it depends on the armament policy. If you have a disarmament treaty it would be reduced whether you have a government monopoly or private firms.

1405. *Dame Rachel Crowdy*: I have several questions that I want to ask Mr. Baker, some very minor ones on small paragraphs in his Statement, and one or two major ones; but before I ask them I would like on my own account as a member of the Commission to thank Mr. Baker for sharing his knowledge (gained from a very wide field and from a vast experience) with this Commission. I think we have all been struck, not only with the interest of the document, but also with the extraordinary sincerity with which Mr. Baker has put forward his arguments and, I may say, his convictions as well, even if we do not necessarily agree with him all the time.

In paragraph 8 there is a short sentence which says: "*But no evidence is ever offered for the view that such big firms or combines make less effort to increase their armament business than they make to increase their other kinds of business.*" I imagine that Mr. Baker wants to drive in by that sentence the point which he made at the very beginning—that he has no grouse whatever against the private manufacturers, but merely looks on them as good business men who have to push their business, who have to advertise adequately and have to create markets. That is your point, is it not?

Mr. Noel Baker: That is my point.

1406. *Dame Rachel Crowdy*: And I imagine you think that if we got government monopoly instead of private manufacture one thing which would certainly disappear, for diplomatic reasons, would be touting for orders. I cannot imagine one government daring at a moment of diplomatic crisis to tout in another country. I think that is your point there, is it not?

Mr. Noel Baker: Yes, it is indeed. The pre-occupation of every manufacturer is not to have idle plant. If he has a large plant standing doing nothing, and no workers there, and it is deteriorating, it is intolerable to him, if he is a good business man; and if you read the writings and speeches of armament manufacturers, as I do, you see that with perfect sincerity they go on harping continually on this point, that they cannot have idle plant. On the one hand, we say it is essential to government policy that we must have idle plant in order that we can expand armament production when war happens, and, on the other hand, these unfortunate manufacturers have the plant on their hands, and, although they get subsidies for it or put the cost of it on the price that they charge for armaments, nevertheless it remains a great distress to them. And that is inherent in the system. If there is idle plant it ought to be in the hands of the government.

1407. *Dame Rachel Crowdy*: Then in paragraph 10 you say under (c): "*There is one known example of the despatch of a warship, at the request of a private firm, on a special voyage to give a demonstration of artillery to the agents of a Government which was the potential client of that firm.*" That is presumably the Turkish case which we have had quoted before?

Mr. Noel Baker: Yes—the Driggs gun. Perhaps I might add that there was a proposal through either the Air League or the aircraft manufacturers—I do not remember which—that a British aircraft carrier should be sent to South America for the same purpose, to advertise British aircraft. It was, according to the evidence which I saw on the matter, considered for some time, but ultimately turned down.

1408. *Dame Rachel Crowdy*: Then under (f) in the same paragraph you say: "*Diplomatic support is given by the Embassies and Legations of virtually all arms-producing Powers to the agents of their private firms when they are seeking orders; on occasion this support is extremely active.*" Do you mean to say that you think the Embassies and Legations give greater support to the agents of armament firms than they do to the agents, say, of biscuit firms or stocking firms, or whatever it may be?

Mr. Noel Baker: The answer, frankly, is Yes, and for this reason. Some Departments of State, who exercise great influence in these matters, believe that every additional order for a British armament firm

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

is an additional guarantee to the security of the country. They want to expand armaments production to the utmost possible extent, and they regard expanded armaments production as greater safety. Therefore they do bring greater pressure to bear with regard to armaments than they do with regard to other things. I could give examples of when that happened in very unfortunate circumstances.

1409. *Dame Rachel Crowdy*: Could you give any examples which you are free to give and which would be of interest to this Commission?

Mr. Noel Baker: I recall the fact that the Foreign Secretary admitted in the House of Commons that support was given; he said it is never given for a firm which is trying to increase orders which foreign governments do not want to give, but only in order that a British firm shall get an order if it is going instead to a foreign firm. I think that is a distinction which in practice is extremely difficult to make. That is a matter which requires a great deal of investigation before you can accept the distinction at its face value. I have actually been in a Balkan capital when the firms of two countries were competing for an armaments order. I have had a close personal friend in one of the Legations who told me over a period of weeks about the vicissitudes of the contest for a submarine order, and he said that one day we were winning and another day we were losing, and so on. I could give the Chairman names and references in private. It was a very striking experience, and I have heard of other people who have had similar experiences.

Dame Rachel Crowdy: I think it would be very interesting, Mr. Chairman, to have those references.

1410. *Professor Gutteridge*: Might I ask whether one of them was a British Legation?

Mr. Noel Baker: In fact it was.

Professor Gutteridge: If that is so, I think perhaps we ought to have it; but if it was between two foreign Legations I do not think it would concern us.

1411. *Dame Rachel Crowdy*: To come now to a rather bigger question. I wonder whether you could enlarge a little on the relative efficiency as you see it of private manufacture and government monopoly, and whether perhaps you could enlarge rather more on Chapter VII onwards, which you touched on very lightly this morning—the question of private manufacture, and the arguments which are put forward in favour of private manufacture. But first, could you give us some further elucidation on the relative efficiency, as you see it, of the two systems?

Mr. Noel Baker: It is a very large question, but I agree with *Dame Rachel Crowdy* in thinking it is one of very great importance; because, of course, if it were shown that government arsenals were in fact from a technical point of view a great deal less efficient than private firms it would affect the argument about prices; it would affect the argument about expansion; it would affect the argument about a number of the so-called concrete advantages of the present system.

I desire to make no hard and fast statement on the subject, certainly not on the general efficiency of government production as compared with private production, but I would offer these observations: In the first place, if there was more inefficiency in government plant than in private plant we should have heard a great deal about it from the private firms. There is very little about government plant that is not known to the private firms and many other people concerned in armaments production; they know everything, or they know a great deal. If there were inefficiency it would certainly get out and would be talked about a great deal. There are many people who would see to that.

In the second place, as I have observed in my Statement, all repair work is sent, as I understand it, to government establishments to be done. It is well known that in all branches of industrial activity it is extraordinarily easy to waste money on repair work; there is nothing which requires so high a standard of efficiency as repair work; and that is certainly not less true of armaments than of other things. Therefore it is an important fact that Mr. Amery said in the House of Commons in 1923, I think, when he was First Lord of Admiralty, that the government send their repair work to the arsenals and dockyards because they do it for less money, because they are more efficient, in other words. There are a great many other independent testimonies that I could cite; I am speaking from memory; there was an article by a man who calls himself "Sentinel" in *Brassey's Naval Annual*. He is a man of very high standing and of great knowledge; otherwise he would not be allowed to write in *Brassey* and he would not speak in the way he does unless he was a man of very high standing. "Sentinel" says that our Royal dockyards are magnificently efficient and they have not got their equal in the world. In the next place, I would submit a little specialised evidence which comes into my head. I happen to have contact with one or two firms which made munitions during the War, and I had a little correspondence with them on a few of the technical points which arose, and I remember one letter in which the chairman of a company said to me that he had found out a way, with the Ministry of Munitions' advice and assistance, of making a gun-bolt in one-third of the time which was taken by the establishment which had previously made them—I think it was Vickers or Armstrongs; it was one of the two; I am not sure which. He said it was not an isolated example; he had found that his firm and other private firms, too, were more efficient than the armament firms.

I need not remind the Commission of the minutes of the meeting—I cite them here somewhere, and they were also cited by Dr. Addison in his evidence. I quote this in paragraph 58: "... a Committee held at the Ministry of Munitions on 24th January, 1916. The members of the Committee were:

Mr. S. H. Lever,
Hon. N. Charles Rothschild,
Mr. John Mann,
Mr. Frederick Palmer.

Paragraph 9 of the Minutes reads as follows:

9. *Conclusion re armament firms.*—The only conclusion that can be reached at present is that:

(a) . . .

(b) . . .

(c) *The organisation and management of their works are inferior to those of other shell manufacturers.*"

In 1916 the other shell manufacturers were the government arsenals and such few firms as by that time had been brought into shell production—they were very few by the end of 1915 and the beginning of 1916. I am speaking on the spur of the moment, but I suggest there may be a reason for it, and I think that perhaps the reason is this: that government arsenals are subject to a very stringent control by the Departments and by Parliament, and the standard of investigation and inspection of expenses, efficiency and prices, and that kind of thing, is very stringent. Therefore it would not take long for inefficiency to be found out and for punishment to be meted out. But in private firms, certainly before the War, and still more to-day perhaps, since there is no competition, broadly speaking, and with these orders they earn very high rates of dividend, they let themselves get into bad ways. I remember an incident, which I have cited here, which was given by Dr. Addison, of a member of the staff of Hadfield who complained that the Ministry of Munitions cut down

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

profits, because, he said, "Before the War we used to be allowed lots of contracts which gave us 25 per cent., which in reality was 33 per cent., profit." Probably in these conditions they allow their business to become rather inefficient. I do not wish to say more than this as a general conclusion; I certainly have no information which would justify me in doing so; but I am sure there is no proved case for thinking that the arsenals are less efficient than the private firms; on the contrary, so far as I have been able to assemble it, the evidence is the other way.

1412. *Dame Rachel Crowdy*: That leads me to another question. Do you feel, supposing we do not have the international agreement that we hope for, that we could abolish private manufacture in England before other countries do, and do you think that the abolition of private manufacture by us would be a reason for other countries to imitate us? I do not mean a reason in theory; I mean something in fact. Do you think other countries would follow our lead if we abolished private manufacture, and if we did it alone?

Mr. Noel Baker: Yes. I think, as I have said, that on the balance of advantage it would benefit a nation to do it alone, whether anyone else did it or not; and that in efficiency, in expansion in time of war, in progress and design, and in various other ways, that we could actually get military advantage. But apart from that—and this is to my mind more important—we should in our country get rid of what I have called the armaments interest from our public life. I have tried to show in my remarks this morning that the armaments interest, without anything which you could call corruption, may nevertheless have a disastrous effect on the course of public policy, and to get rid of that would, I think, be an immense advantage to our own country.

With regard to your question whether, if we were to abolish private manufacture in this country unilaterally, our example would have any effect on other countries, I think myself that it might have a most important effect in strengthening the hands of those people in other countries who want to abolish private manufacture; and there are many.

The Commission may remember that the Daladier Government (of which I spoke this morning) made proposals in the autumn of 1933 for the support of certain parties in the Chamber of the French Parliament which contained a promise to abolish private manufacture. The other parties in fact refused that proposal and the Daladier Government fell from power; but if the proposal had been accepted there would have been a majority for carrying through the abolition of private manufacture in France. I believe that if our country did that it would tend to make those people who have a majority in the French Chamber do the same. I think it would immensely strengthen the people in Belgium who want to nationalise their armaments industry. I think that, in the way these things work, it would in fact make it more probable. It might have no direct effect but certainly it would be an important factor in mobilising the opinion from which an international agreement follows.

1413. *Dame Rachel Crowdy*: It is rather outside the question in a way, but, remembering that particular time when, according to your statement, the French so very nearly pulled off the abolition of private manufacture, do you feel that if they had succeeded in bringing about the abolition it would have encouraged us as well as other countries to do the same?

Mr. Noel Baker: It would have been a very powerful argument for people like me, who try to persuade the country that it is a good thing to do. 1414. *Dame Rachel Crowdy*: The only other thing I really wanted to ask you was this: Can you develop a little for me the scheme for international control of commercial aviation? It is not really very

relevant, perhaps, to our inquiry, but you make a great deal of it in your Statement, and it is interesting from the point of view that presumably international control of commercial aviation might develop into international control of military aviation in the case of crisis.

Mr. Noel Baker: Yes.

1415. *Dame Rachel Crowdy*: Supposing such an international government control had been in existence at the time of Japan's withdrawal from the League of Nations, would she not have withdrawn her pilots as she withdrew her nationals from the International Secretariat? Would not Germany have done the same thing and what would have been the effect? Will you clear this point up for me?

Mr. Noel Baker: You have asked me two very big questions, one of which relates to commercial and civil aviation and international control. The other relates to what is ordinarily spoken of as an international police force, which I will develop later.

With regard to commercial aviation, the different committees in Geneva during the Disarmament Conference, and a number of preparatory committees before the Conference, met and discussed in great detail various plans for international control of civil aviation. Some of them went very far; some of them less far; but all, I think, were founded on the basic idea that under existing conditions aviation suffers from appalling handicaps, and must so suffer. The commodity which aviation has to sell is speed, and speed depends upon being able to make long journeys without interruption, or with a minimum of interruption. The relative speed of aircraft and railways over any distance, shall we say, within the British Isles is not very much different; you can get to Newcastle by train very nearly as quickly as you can by aeroplane, because the aerodromes have to be a long way outside the cities. The difference is not very much; but the difference over a long journey—say from England to Tokio—is immense. Scott has flown from here to Australia in less than three days, whereas a steamer takes six weeks or more. That is a tremendous difference. If you could free commercial aviation from the restrictions which now hamper it you would be able to have an expansion of the inter-continental services which would stagger the imagination, and I believe it would be practical politics.

The national restrictions which now exist are best illustrated by the experience of a number of British companies in trying to arrange routes to other parts of the Empire. They have tried to arrange routes, for instance, to South Africa. To-day, if you want to go to South Africa, you still have to get into an aeroplane at Croydon and fly to Paris, and then in Paris you get into a sleeping car and go to Brindisi, and you lose 38 hours and make a number of changes and waste a lot of time; whereas if you had a proper international regime in which the national restrictions were done away with you would, of course, make the journey right through to South Africa without any interruption.

A scheme was laid before one of these committees, and I remember being told by Senator de Brouckere, a very high authority on this matter, that in his view, in the way in which they had worked it out, the scheme was absolutely watertight for the organisation of a new transport service for Europe which would collect mails at 7 p.m. in any capital in Europe and deliver them in any other capital in Europe at 7 a.m. the next morning; from Helsingfors to Athens, from Moscow to Madrid, and so on. But, of course, that actually depends on having a completely international organisation, international airways with beacons, international aerodromes and stations worked on a co-ordinated system. This was a number of years ago, and things have changed. The extra cost would have been half the transport charge of an ordinary foreign letter. The transport charge is about 1d.; the rest is administrative; so that it would have been an addition of about 3d.—

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

from 24d. to 3d.—on your foreign letter. You could have had that mail service for Europe, and it could have been done three or four years ago.

If you translated it into terms of international traffic, with stations, ground services, meteorological services, and so on, you would have an immense expansion; but this internationalisation is usually thought of as being a very damaging thing. Our present commercial aviation is on a very modest scale, and our own people are the first to admit it. We count our commercial planes in tens, the French in hundreds, and the Americans almost in thousands. Of course, we are very far behind, and we must be until what is called internationalisation is carried through.

Perhaps I may say that one of my points, which Dame Rachel Crowdy raised, about the merging of firms into large combines, is rather illustrated by this: that the aircraft manufacturers actually persuaded the Federation of British Industries, which, of course, is not a combine but an association of employers—it persuaded them to make a protest against internationalisation because it would damage British commercial aviation, when I think the slightest examination of the facts would really convince anyone of good faith that the thing is completely the other way.

I pass on to the question of an international police force. That, of course, was debated in Geneva at very great length, and a number of schemes were put forward, either for a completely international police force or for a series of national contingents trained together. The organisation of an international force involves difficult problems, as does the organisation of an international civil service. That has been solved in the Secretariat of the League of Nations, and the French, who urged this scheme very strongly, used to urge that the problems for the most part were identical with the problems of an international civil service, and that, since the one had been solved, the other could be, too. It was said that at a moment of crisis the Germans or the Japanese might try to withdraw their contingents; but others pointed out that the League could stop that; it could keep them in confinement and not allow them to go back; but if it did not, they would only be a very small part of the whole. No one country could possibly have a contingent which would outnumber the rest. My own conclusion from the debates I heard there was that the technical problems of an international air police force could easily be overcome.

1416. *Dame Rachel Crowdy*: You do not see any danger of international control of aviation providing a military weapon for the hands of some powerful member of the League—I ask this because an expert told me the other day that any civil plane could be quickly and easily converted to a bombing plane?

Mr. Noel Baker: I think that is true. It is right to say that Colonel Moore-Brabazon, who I think was the first man to fly in this country, takes the view that once civil aviation was de-militarised, or, as he says, has the mark of Cain taken off it, then immediately the divergence between civil and military types would become tremendous. I think I am not misrepresenting him in saying that in his view the difference would be as great as the difference between a merchant-man and a man-of-war to-day. He says the divergence would be very great. Apart from that, the argument used seems to me to be not a very convincing one, because those planes are going to be put under international control; that is to say, under the orders of an international board or under a series of national companies organised on an international basis—including, of course, international inspection and control.

1417. *Dame Rachel Crowdy*: International government inspection and control, not international business control?

Mr. Noel Baker: No; a League of Nations control.

1418. *Dame Rachel Crowdy*: I see.

Mr. Noel Baker: And inspection. They might be national companies, but there would be effective measures taken to see that they were internationally controlled. I think myself that the further you go in the direction of making it international—if you internationalise the panel of pilots and internationalise the board which controls them—the more likely you are to get national security for all concerned, because the less likely you make it that any government would be able to seize a group of those pilots or machines and use them for aggression.

I would commend to your attention a paper (and, as I think, a very valuable paper) written by Air Commodore Fellowes, who led the Everest Aircraft Expedition, and who has made a special study of this matter. He has urged very strongly the internationalisation of commercial aviation and has actually propounded a plan. I think that carries great weight, because he held a position of high responsibility in the Air Ministry in connection with civil aviation in times gone by.

1419. *Sir Kenneth Lee*: Did I understand you to say in reply to Dame Rachel Crowdy that you thought that if the private manufacture of arms was abolished there would be no competition for orders between governments?

Mr. Noel Baker: I think it extremely unlikely that governments would go touting for orders. I, perhaps, ought to repeat an explanation which I gave this morning: that if we abolished unilaterally—and that is what I am hoping will be the main recommendation of your Commission—we should then have the problem of whether our Government would go touting for orders. We certainly should not realise this aim unless we had a national armaments board to which all commercial inquiries would be required to be sent. That would operate in full publicity, and I am quite certain our public opinion and our Parliament would prevent touting for orders. If it goes beyond that, if there is general abolition by international agreement, there will certainly also be, in my view, a system of international inspection and control of the whole armament industry, of all factories where armaments are made; because I do not believe for one moment that the one part, the abolition, would be accepted without the other, namely, the inspection and control of government factories, and international publicity for all armament transactions and trade of every kind. I think that would exclude touting for orders.

1420. *Sir Kenneth Lee*: But surely each government would be very anxious to supply the people whom they thought were their friends with the arms which they were using themselves, in order to protect their friends?

Mr. Noel Baker: I think it very likely that their General Staffs would urge that, as they do to-day, and I think very likely the General Staffs of the allied countries, if they went on having alliances, would insist on arms coming from the country which was their ally and which was a producing country.

1421. *Sir Kenneth Lee*: Would not that lead to touting?

Mr. Noel Baker: I do not think so. I do not see why. I think definitely that the pressure which comes from the profit motive would be excluded. I do not think that the governments will be moved by the profit motive. I will not repeat what I said this morning on that subject.

1422. *Sir Kenneth Lee*: I should have thought it would have meant that competition would still exist for orders?

Mr. Noel Baker: If competition does exist then it means the position of the smaller states is

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

not one of danger or difficulty, because they can always move over from one to another. I certainly do not think there would ever be a ring of producing states. That I am sure is an hypothesis which can be excluded. At the same time I do not think there would be competition in the sense of trying to push up armament orders. There are other countries which are pretty well civilised, too. Most industrial countries have a rather high standard of civilisation, though some of them may be passing through difficult times at the moment, and they would see that their interest is not really to increase armaments, because Lord Wester Wemyss's fundamental proposition remains true that if you increase your export you are increasing the armaments of some other power, and if you do that their neighbours increase theirs. It goes like a ripple across the pond; the armament level rises and you get a general increase which was not otherwise going to happen. You push up the whole level of armaments; that pushes up your own expenditure and quite certainly your taxpayers lose, and the government has to provide a budget which will be far greater than any profit you can make on the armament transaction itself.

1423. *Mr. Spender*: You feel fairly convinced that governments would resist the temptation to which they now succumb of supplying armaments in return for political favours or promises?

Mr. Noel Baker: I think it would be far more difficult for them to do it. Now they can do it under the cover of the private firms; but if they had to come to Parliament with all these matters it would be far harder for them to do it.

1424. *Mr. Spender*: You do not think it would be necessary to take the further step of prohibiting loans from governments to their protégés?

Mr. Noel Baker: I think it would be a very desirable thing to do.

1425. *Mr. Spender*: You do not think that is possible, though, in the present state of opinion?

Mr. Noel Baker: It is difficult to say that you could get it agreed to everywhere, I quite agree.

1426. *Mr. Spender*: You quoted Lord Grey on naval competition. Lord Grey's point was that the armament competition expressed a conflict of political ideas and policy. Would not that be true?

Mr. Noel Baker: I think not quite. As I remember the passage—I have read it many, many times—it is the passage in which the sentence occurs which I quoted in my paper. There were between us and Germany many outstanding questions—and between the other countries in Europe—the question of colonies, and so on—and Lord Grey had tried to settle those matters; but it was not, in his judgment, his failure in that regard which made the War inevitable. On the contrary, it was the armament competition. I do not want to over-state it.

1427. *Mr. Spender*: I am not disputing that point; but I am only suggesting that he did not relate it at all to the question here of the private manufacture of armaments; I do not think it presented itself to him at that time?

Mr. Noel Baker: I do not think he mentioned it at all.

1428. *Mr. Spender*: It brings one to rather an important point: what are the real influences behind armaments. If I understood you, you seemed to say that the failure of the Disarmament Conference in the last two or three years had been to a considerable extent influenced by agitation by private manufacturers behind the scenes?

Mr. Noel Baker: Yes.

1429. *Mr. Spender*: When we have so many objections and glaring political policies for that failure, can you really attribute a very large influence to the machinations of sinister influence behind the scenes? It seems to me it is putting the thing rather out of perspective to put it in that way?

Mr. Noel Baker: Perhaps I might suggest the political influences were not really of a kind to make nations consider—

1430. *Mr. Spender*: The fear of Germany by France?

Mr. Noel Baker: In my view, there was no cause in the German situation which justified France in thinking—

1431. *Mr. Spender*: It is not a question of justifying; it is a question whether it was a motive?

Mr. Noel Baker:—which would have made the French public think that Germany was going to make another attack upon them in the early future, except for the work done over a period of 15 years from 1920 onwards by the armaments Press in France, which stated year by year over the whole of that time that Germany was continuously rearming, when in fact they were disarmed almost to the bone.

1432. *Mr. Spender*: But you would not suggest it needed that incitement to make the mass of French people have that fear?

Mr. Noel Baker: M. Briand thought so. He tried for a large number of years to work a policy of Franco-German reconciliation, and he got it, and he got the support of the French people for it; but he always said—in private I have heard him say it dozens of times—but he said it very emphatically in public: "The pens which write these articles are made of the same steel as the guns." It was his profound conviction that an immense influence in French politics against his policy of Franco-German reconciliation was the campaign of the armament firms to make the French people believe that the Germans were arming, when in fact they were not.

1433. *Mr. Spender*: No one would deny that that was a contributing factor; but I, too, have heard M. Briand. I heard him make the speech which he made at Washington, which had such a disastrous effect, but it was entirely on the opposite line. I do not want to carry that point very far, but it does lead us to another point: Would you by a state monopoly really relieve the pressure? You quoted the Comité des Forges, which is the chief controlling interest over the Press. That is the great iron and steel industry, is it not?

Mr. Noel Baker: Yes.

1434. *Mr. Spender*: It would have the same motive for pressing governments to increase armaments as it has at present, even if governments manufactured them?

Mr. Noel Baker: Not quite, I think.

1435. *Mr. Spender*: Very nearly?

Mr. Noel Baker: The very important element of profit made on the component parts and on the finished arms would be cut out. It would only be the raw steel.

1436. *Mr. Spender*: Still, that would be a great factor?

Mr. Noel Baker: I think, with great respect, it would be desirable also to establish government steel plants. I think that is very important. Certainly in respect of some kinds of armaments, for example, the large gun, I believe the cost of the raw steel is about half of the whole.

1437. *Mr. Spender*: You would not say the government for this purpose would have to go the whole length of providing the iron and steel—go to the mine?

Mr. Noel Baker: No; but I think a steel plant is one thing and a mine is another. I think a steel plant would certainly be justified on many grounds.

1438. *Mr. Spender*: Take another point. Shearer was not a nominee of armament firms; he was the nominee of the shipbuilding interests, was he not?

Mr. Noel Baker: They make cruisers.

1439. *Mr. Spender*: Yes.

Mr. Noel Baker: And guns and ammunition. Bethlehem and Newport News, I think, are just as much armament manufacturers as Armstrongs were before the War.

1440. *Mr. Spender*: Is not there another very important consideration? When you have these government arsenals will not you have a very important pressure brought to bear on behalf of the

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

workers employed in the dockyards? Will not that be a constant pressure to keep up employment, and so armaments?

Mr. Noel Baker: I have examined the evidence on this question as well as I am able—and no private student can do it thoroughly, especially if he is a very busy man, as I am—but I have never found any evidence that dockyard workers have agitated for an increase in armaments. There was a great agitation at Woolwich before the War, which Dr. Slater had a great part in, against the discharges from Woolwich Arsenal in favour of the private firms. There was no agitation then in favour of an increase in armaments. I have never come across it. The city of Kiel, which has dockyards, elected a German socialist to Parliament, to the German Reichstag, who voted against the building of the German pocket-battleships. That meant his electors were without work and were unemployed. He went back at a new election and was elected again. Similarly Herr Liebknecht who exposed the evils of the armaments trade before the War, was elected by an armament making town, and was re-elected. There is ample evidence that the workers have not brought pressure to bear for the increase of armaments as such.

1441. *Mr. Spender:* I have known candidates for dockyard towns all my life, and I have heard their views, and they certainly would not favour a reduction in armaments.

Mr. Noel Baker: They want to get what orders there are, of course, and they scramble for them. I admit that; but I think the danger on that point has been very greatly overstated.

1442. *Mr. Spender:* One question with regard to the basis of expansion which is one of the things which is troubling me, looking at the possibilities. In establishing government arsenals, are you thinking of peace-time armies, or are you going to provide something corresponding to what the French and the Germans do for their big armies? Most of the defects which have been alleged in the case of the existing armament firms were that they were not ready for expansion, and therefore if you were going to remedy that in your government arsenals it would need, it seems to me, a very much larger expenditure and a very much larger holding of labour in reserve, and materials?

Mr. Noel Baker: I come back to the point that, in my view, the amount of plant which exists at any given moment is the amount required to make the annual total production, plus the amount of idle plant which the government chooses to pay for. That may be any amount you like, but there is no reason why under government monopoly it should not be exactly the same as it is under the present system, and I think it would cost the country no more.

1443. *Mr. Spender:* Except it is commonly stated to us that the armament firms can afford to keep that plant idle, or possibly occupied in other ways in the meantime, without any great cost, whereas the government arsenals would be under the necessity of keeping a large part of that plant idle. At the beginning of 1914, would it not be true to say that our great difficulty as compared with the French or the Germans was that we only started with the small arsenals appropriate to our small army whereas France and Germany had great arsenals and establishments appropriate to their big armies?

Mr. Noel Baker: If that were true, it would mean that our dependence on private firms had handicapped us, as I understand it; but the point that private firms are able to keep idle plant at the service of the nation is one on which it is very important to make a careful examination of the facts. And the facts are that the private firms do not keep idle plant standing for the service of the nation, because they cannot; they cannot afford it. They receive direct subsidies—I cite one here which I took out of Hansard—from the Government, when

there is no hope of the plant being used; and they receive indirect subsidies, undoubtedly, in the prices which they get for the products they produce. The prices are much higher than they would otherwise be. They get disguised subsidies of various kinds. For example, the monopoly of the I.C.I. in a number of products in this country is certainly a very important subsidy for which the British taxpayer indirectly has to pay. No doubt on the strength of that subsidy the I.C.I. can keep some idle plant, but the nation is paying. I think it would have to pay much less if that plant were kept in a government arsenal, because the actual cost of keeping idle plant in government establishments is less than keeping it in private factories.

That the private firms are content to keep idle plant is, I think, disproved by the speeches which the private manufacturers make themselves. I have read dozens of speeches protesting against the fact that the private manufacturers are expected to keep idle plant, and the speeches made by unhappy armament makers after the Washington Conference would fill a book, in which they said disarmament would ruin them, and so on. I will read only one speech which I have actually quoted in my Statement, in paragraph 192 (c), by Sir Robert Hadfield:

"It is doubly unfortunate that the cost of putting these theories (i.e., disarmament) into practice should fall in the main upon an industry which is already struggling against unfair economic conditions which are beyond its control. The politician is always ready with advice to turn over to peaceful products, not realising that highly specialised plant cannot be diverted in this way, and further, that the supply of those peaceful products already far exceeds the demand, so that such a remedy, even if practicable, would merely add to the difficulties of other sections of the trade."

In other words, he protests vigorously, as all of the other manufacturers protest, if the plant is idle, and they protest even although in fact they are receiving subsidies for it to do so.

1444. *Mr. Spender:* Does not that suggest that the Government is doing rather well out of the armament firms? They will always protest that they are being ruined; I am only putting it to you; I am not expressing any dogmatic opinion about it; it is only that the probabilities are that if the Government and the private firms can work together, especially with regard to labour, and having labour at their disposal, you might make a cheaper and more economical arrangement than if you had a wholly government staff. That leaves out of account all possibility of a great many other questions, such as control, and so forth.

Mr. Noel Baker: I would reply that if the Government are doing well with idle plant at the expense of the private manufacturers, then it is very unfair to the private manufacturers.

1445. *Mr. Spender:* The private manufacturers generally look after themselves, do they not?

Mr. Noel Baker: I think they do. I do not think that in fact the Government does do very well, because I think it has to put up with the complaints of the private manufacturer when his plant is idle and nevertheless pay him for the fact that it is idle. I think that the Government in fact loses both ways under this system, and I think it gets no advantage whatever; but if it does I think it is wrong, because this is a risk which follows from fluctuation in armament demands, and fluctuation in armament demands follows from government policy and it ought to be borne by the nation, and it would be borne by the nation, if the idle plant were kept in government arsenals.

1446. *Sir Philip Gibbs:* Do you think, if there were a limitation of arms, an international limitation, it would necessarily enforce a government monopoly of manufacture, or, at any rate, tend to produce such a government monopoly of manufacture?

Mr. Noel Baker: I think it would make the inducement to the private manufacturer less than

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

it is to-day. His market is ostensibly limited by the disarmament treaty, and might be in fact limited. But as I have tried to suggest in Chapter IV, the private manufacturer would have a number of reasons for trying to evade the disarmament convention, and there are a number of ways in which he might possibly do so.

1447. *Sir Philip Gibbs*: I am now asking a question rather in favour of your argument, and it is this: If there were a drastic limitation of arms, it might be that it would not pay the private manufacturer, and therefore we should actually be faced with the necessity of some form of government monopoly. Would you agree with that?

Mr. Noel Baker: Oh, yes. I often wonder why people go on with the private manufacture of arms at all; it must be a most unsatisfactory industry, because of these immense fluctuations.

1448. *Sir Thomas Allen*: I want to ask you about one or two points, by way of elucidation, on the summary of your conclusions in Chapter XVII. I take it that in any change-over from private manufacture to national production you would not desire to place non-producing nations in any less advantageous position to meet their legitimate needs? May I put it in another way: Why should this nine per cent. which you spoke of just now be lost to us if private manufacturers were abolished; why should it be lost under a state monopoly?

Mr. Noel Baker: I think it probably would not be lost. In my view, the position of the non-producing states is well summarised in the passage of the memorandum prepared by the Danes and the Poles and other countries at the Disarmament Conference, in which they said definitely that the non-producing states derive no benefit from the system of private manufacture, and that the abolition of this system would therefore not modify the situation of the non-producing states in any way. That was a view expressed by a group of states which included Denmark, a non-producing nation, and included also, or at least it was supported in committee by, other non-producing states.

1449. *Sir Thomas Allen*: The Netherlands, for example, did raise objection to state monopoly on the ground of technical difficulties of state manufacture as being far greater for the small nations than for the large.

Mr. Noel Baker: At what date?

1450. *Sir Thomas Allen*: At the same time.

Mr. Noel Baker: I do not remember that. It may well be I have missed it in the records.

1451. *Sir Thomas Allen*: That was because of the geographical condition and disadvantage.

Mr. Noel Baker: It is very doubtful how far the Netherlands are a non-producing state. They produce a good lot of armaments for themselves.

1452. *Professor Gutteridge*: I was under the impression that Holland was not an armament-making country, but I was told that some of the German firms have established branches in Holland. I put that to a friend of mine, and he said, "You are quite wrong in saying that Holland is not an armament-making country; because a lot of German firms have established branches in Holland"; and he told me that he had bought things from Zeiss.

Mr. Noel Baker: And Krupps.

Professor Gutteridge: They both have branches in Holland?

1453. *Sir Thomas Allen*: Much stress has been laid upon the point as to the difficulty of armaments in peace-time. Do you see any reason why the state should not keep armament factories going in peace-time by producing peace-use commodities?

Mr. Noel Baker: No; I entirely agree with the suggestion that national arsenals might very well have alternative work in the form of peace-use commodities which are required by government departments and by the armed services. It has this particular advantage, that the services know over a long period of time ahead that there are certain commodities of which they want so much every year

whatever may happen, and probably largely expanded quantities in case of emergency or war. Those commodities could quite easily be built up in reserve in times of peace. If a war did not happen they would be waste—that is quite true—but if a war happened they would not be waste; you could then just turn over to armament production and you would have the stocks you needed of those things; and in my view it is something which a government department could do by way of keeping the plant employed which a private firm cannot do, because they cannot afford to build up stocks like that which are not being used.

1454. *Sir Thomas Allen*: You said just now, in reply to a question by the Chairman, that the real objection to private manufacture was founded on the question of profit. Do you see in the American plan any attempt at all to abolish profit?

Mr. Noel Baker: No, I do not. That is why I think all systems of control are much less adequate than a system of abolition. I do not say they would not produce satisfactory results; I do not say they ought not to be done if nothing else can be done; but I believe that, in dealing with what I have called the major evil, the political influence of the armaments interest, abolition is by far the most effective plan.

1455. *Sir Thomas Allen*: Are you visualising the American plan altering the present situation?

Mr. Noel Baker: Of course, if it were carried through *in toto* it would mean a great deal of publicity for the whole of the transactions of armament firms. It would mean that their orders had to be published before they were executed; the licence to them would be given international publicity, and international committees of control could go into the factory and see what was going on and see whether the work corresponded with the orders which had been reported to Geneva, and if there was any divergence the inspectors would no doubt find it out. It would mean that the private firms would be hampered a good deal in some regards; for example, in respect of illicit traffic, which is important in many ways in my view. The illicit traffic in the 19th century was thought to be immensely important. The British Army on the North-West Frontier still thinks this illicit traffic very important; but it would not deal with what I call the social and political evils—that is to say, it would not enable the government to know how an armament order had been got, whether there had been bribery or the incitement of one government against another, and so on.

1456. *Sir Thomas Allen*: In your Conclusion No. (10) you say:

"If Private Manufacture is not abolished, then as an alternative the following measures should be taken:

(a) 'Public Utility' control over private firms to limit the prices or profits;

(b) The establishment of a National Arms Board with a monopoly of the home and foreign marketing of arms."

Are you visualising two bodies here, or one?

Mr. Noel Baker: The first would not exactly be a body; it would be a regime which the private firms would have to accept. It would involve inspection of their books, calculation of the costs, calculation of the normal profit which ought to be allowed to them, and so on. I argue elsewhere that that is less likely to be advantageous to the government than actual government production. Probably the costs under such a system would be higher, but that is a different point. The point here is, I think, that that would be a kind of regime, and that when they had made their arms under that regime they would then be transferred to the National Arms Board, who on behalf of the nation would do the commercial transactions—would carry through the commercial transactions required.

1457. *Sir Thomas Allen*: I asked you that because I had in mind that when Dr. Addison was before us

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

he was very insistent upon a single supply authority for all arms. He pointed out that the different services had been obtaining materials and machinery from firms at the same time, and it was very necessary that there should be a single authority.

Mr. Noel Baker: I am in entire agreement with that view. I did not stress it here because I thought Dr. Addison had put it with so much cogency and with so much greater authority than that which I can command.

1458. Sir Thomas Allen: Now with regard to civil and military aviation: you will agree that in the future both civil and military aviation will be very important matters. I think it was the Union of Democratic Control that said that the government should provide all the instruments of aviation. Is that your point: that, given state manufacture or state monopoly of war-time material, the state should deal with the civil side of aviation? Would you have them as a separate entity?

Mr. Noel Baker: Yes, certainly.

1459. Sir Thomas Allen: I have in mind the easy conversion of civil aeroplanes into armaments. You would still have a separate authority for the manufacture of civil aeroplanes and a separate authority of state monopoly for military aeroplanes?

Mr. Noel Baker: Yes. I think it might be advantageous to the nation to nationalise the whole aircraft industry; but that is a different point, and, I think, not strictly relevant to the terms of reference of this Commission. I think the question of the vested interest could be met by eliminating the private manufacturer of military machines, and I think that could be done, if we were acting alone in this country—unilateral abolition—by simply saying to the manufacturers: The government is going to buy no more military aircraft from you, and it is going to allow you to export no military aircraft to other countries. If there was a very suspicious increase in the machines of a civil type which were going to another country, and which might be organised for military purposes, if we had ground to suspect that, I think the government would find it out in no time and could penalise the company. I do not think there would be any substantial danger of evasion on that point.

1460. Sir Thomas Allen: I put that to you because I have in my mind the evidence of the Union of Democratic Control. They felt that this particular armament service should not be left to private enterprise at all.

Mr. Noel Baker: My own preference would be for the total nationalisation of the whole aviation industry, but I do not think it is essential to the purpose of this Commission.

1461. Professor Gutteridge: I have not many questions to ask you, but that is not out of disrespect to your admirable memorandum. There are, however, one or two things about which I should like to ask you, and the first is this: With regard to the question of neutrality at the present time, I think it is wrong to say, is it not, that the Covenant has abolished neutrality; surely it still exists, does it not?

Mr. Noel Baker: Not as between States which are members of the League.

1462. Professor Gutteridge: That is what I am not quite sure of. May I put this to you: For instance, you may, of course, have hostilities which are outside Article 16 of the Covenant because the dispute is between non-members—that is clear, is it not?—and also I suggest to you it is possible to have a dispute between two members which will in fact fall outside Article 16 of the Covenant merely because the League members cannot agree amongst themselves as to whether a breach of the Covenant has arisen or not; they meet at Geneva and they cannot agree as to whether the hostile states are at fault or not. Surely in that case the law of neutrality still applies as between members of the League, does it not?

Mr. Noel Baker: As regards the first question, it would not be as between members of the League.

1463. Professor Gutteridge: That goes without saying.

Mr. Noel Baker: Even between non-members, that comes under Article 17. It reads as follows:

In the event of a dispute between a Member of the League and a State which is not a Member of the League, or between States not Members of the League, the State or States not Members of the League shall be invited to accept the obligations of Membership in the League for the purposes of such dispute, upon such conditions as the Council may deem just. If such invitation is accepted, the provisions of Articles 12 to 16 inclusive shall be applied with such modifications as may be deemed necessary by the Council.

Upon such invitation being given the Council shall immediately institute an enquiry into the circumstances of the dispute and recommend such action as may seem best and most effectual in the circumstances.

If a State so invited shall refuse to accept the obligations of membership in the League for the purposes of such dispute, and shall resort to war against a Member of the League, the provisions of Article 16 shall be applicable as against the State taking such action.

If both parties to the dispute when so invited refuse to accept the obligations of membership in the League for the purposes of such dispute, the Council may take such measures and make such recommendations as will prevent hostilities and will result in the settlement of the dispute.

So that even in that case it seems to me there is a certain doubt as to whether neutrality in the old sense could be said to exist.

1464. Professor Gutteridge: I do not know whether there is much difference between us, because I agree with you that the Covenant, of course, must have had a fundamental effect upon the question of neutrality. I am not at all sure that your statements in paragraph 177 do not go rather too far. I should have thought that it was still possible to have cases in which an appeal to the old law of neutrality would be necessary.

Mr. Noel Baker: If I may say one word on the second case which you cite—where states cannot agree as to whether a violation of the Covenant has occurred, and the Covenant breaks down because there is no agreement between the members—I can only say in reply that Article 16 as it stands, which binds us and the other governments which belong to the League, does not make necessary any agreement on that point. Our obligation arises when in our judgment (assuming good faith, of course) a violation has taken place; in other words, our obligation arose the day Italy went into Abyssinia, quite irrespective of whether the other members of the League agreed that Italy had committed a violation or not. But of course if the vast majority of them said: "Nonsense! there was no aggression, and no one must help," then the whole League would break down. But otherwise we are under obligation to go ahead.

1465. Professor Gutteridge: If we tried to do anything we should be met by the law of neutrality. The offending state would then be entitled to say: "You must keep your hands off, because the international law of neutrality enjoins you to do so."

Mr. Noel Baker: I should like to think about that.

1466. Professor Gutteridge: It is rather controversial, I agree. I am only suggesting that the statement goes rather too far, both as regards the Covenant and, moreover, as regards the Kellogg Pact.

Mr. Noel Baker: I know something of the way in which that memorandum was drafted, and perhaps I may in camera tell you of the authority which there is behind the memorandum.

30 October, 1935.]

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

1467. *Professor Gutteridge*: I suggest that the Kellogg Pact does not necessarily do away with neutrality, because, as a matter of fact, if you get an offender against the Kellogg Pact he is entitled to say, "You must not interfere with me, because you are a neutral."

Mr. Noel Baker: I think, so far as the Kellogg Pact is concerned, what you can say is that Mr. Stimson said it ought to do away with neutrality. That was an *obiter dictum* by him when he was Secretary of State; but in practice what will matter, I think, is that the United States are going to follow their policy of stopping all munitions for belligerents, and I believe they are going to. If they do that, most of the arguments used on this point fall to the ground, because the argument used is that under the present system we can get an immense supply of munitions from America, which we would not be able to get if private manufacture were generally abolished.

1468. *Professor Gutteridge*: I think your view is that you can no longer in the future count upon large supplies of munitions from abroad?

Mr. Noel Baker: Certainly not from the United States; because I think their present neutrality resolutions are going to be made permanent, and they will not be allowed to export—unless they are interpreted in the sense which seemed likely a little while ago, when they might export to non-aggressor states.

1469. *Professor Gutteridge*: It seems to me that the question, if you approach this from the angle of national safety, is that it is more urgent and necessary than ever that our supply of munitions should be assured in time of war. One thing is troubling me: Supposing you have nothing but state arsenals in this country, and hostilities were to break out on a very large scale, as they did in 1914, you are going to have a period of very great danger, are you not, of perhaps weeks or months, because it will take some time for the trade to be ready to meet any requirements which are caused by the emergency; in other words, you might have a danger period of months if you relied solely on state arsenals? I do not know whether you would agree with that or not.

Mr. Noel Baker: I will try to restate my view on that, because it is really fundamental to the whole question. The plant which you have for armament production on the outbreak of war will be the plant that you have producing armaments in time of peace, and that will be the same whether the armaments are produced in government factories or in private factories, except for this problematical one-ninth.

1470. *Professor Gutteridge*: As I understand your thesis, you postulate that x amount of plant is required?

Mr. Noel Baker: Yes.

1471. *Professor Gutteridge*: And you say the result is the same whether nine-tenths of that is in state arsenals and one-tenth in private firms, or the other way round. You have always got your x , your constant factor?

Mr. Noel Baker: For the production of armaments?

1472. *Professor Gutteridge*: Yes. The point I was putting to you was not quite that. Does not it mean that you have to keep your reserve of plant, your machines, tools, jigs and gauges, and things that cannot be made very quickly, and so forth, at a very high level?

Mr. Noel Baker: I think not; I think no higher than you do in any other case, because your problem is to expand your actual plant which is in operation on the one hand, and that you can do just as well if it is in a government arsenal as you can if it is in a private factory.

1473. *Professor Gutteridge*: You are going to disperse a lot of skilled labour?

Mr. Noel Baker: If you are going to teach the general engineering industry to come into armament production you must disperse some skilled labour; you cannot do anything else. The armament firms failed in 1914 largely because they did not disperse skilled labour, because they tried to make other engineers produce parts which they did not know how to produce, and would not really give them the information they required, because they were afraid of making competitors for themselves. That is another inherent difficulty in using private firms as agents of industrial mobilisation, that they do not want to make competitors for themselves afterwards.

1474. *Professor Gutteridge*: Let me put it in this way: I think it is quite easy to keep a reserve supply of machines, for instance; you send a man round with an oil can every now and again, and so forth, and keep them in order; but I see very great difficulties about the question of labour, because if you close down all your armament firms, unless the government are prepared to keep a large staff of men idle or practically idle, you are faced on the outbreak of war with a very serious position. You have the McKinnon Wood Report. That Report points out that owing to the circumstances of the War from 1914 to 1919 an educated reserve was in hand. As I understand it, that educated reserve has now entirely disappeared?

Mr. Noel Baker: Just as you have x amount of plant, so you have x number of workers making a given article of armament.

1475. *Professor Gutteridge*: I agree; only is it not the fact that it is much more easy to employ your redundant workers in a private firm than it is in government arsenals?

Mr. Noel Baker: Sir Robert Hadfield says not in this quotation which I have read this afternoon.

1476. *Professor Gutteridge*: I thought he was referring to plant.

Mr. Noel Baker: He is.

1477. *Professor Gutteridge*: I am thinking of workers.

Mr. Noel Baker: It applies just the same.

1478. *Professor Gutteridge*: I am not sure that it does. Take a firm like Vickers; it is much easier for them to switch skilled men off, let us say, making gun fuses on to some other work, than it would be for the government arsenal. I still have an open mind on the point. It seems to me there is the possibility that that is what would happen.

Mr. Noel Baker: I believe that in fact the highly skilled workers are really engaged 100 per cent. of their time in armaments manufacture, or else they are out of work. I do not profess to have complete information on it, but that is my information so far as I have any.

1479. *Professor Gutteridge*: You have inquired into it.

Mr. Noel Baker: So far as private students can.

1480. *Professor Gutteridge*: I only wanted to know what your view was.

Mr. Noel Baker: My view, broadly speaking, is that the highly skilled people are kept on armaments work; otherwise they are probably doing nothing. On the other hand, there are people in other kinds of employment—Dr. Addison talked about them—who have a very high skill in their own lines—watchmakers, and so on—who can be turned over; so that there are reserves of skill in other ways; but, broadly speaking, I think that my proposition holds true in respect of labour as it does with regard to plant: that the man-power will be the man-power required for making armaments in time of peace, and you have to build on that basis. How can you best build? That is the problem. I believe that experience has shown that you can best build by having those men in government arsenals, because from a government arsenal they can operate much more effectively; they can make the jigs and gauges required; they can make

Mr. P. J. NOEL BAKER, M.A.

[Continued.]

the drawings and specifications; and when they are ready they can go round and give instruction.

1481. *Professor Gutteridge*: I wanted to have your views because we shall no doubt be having further evidence on this question.

Mr. Noel Baker: My views are set forth in Chapter XVI.

1482. *Professor Gutteridge*: Except that you seem to confine yourself rather to plant. That is why I asked you to amplify them. I am not quite certain that competition is not of very great service to the country in some ways. May I mention one, in the case of shipbuilding? Where you have a British shipbuilding firm in competition with foreign firms for building a passenger liner, let us say, there is an amount of experience which they gain in that way which no dockyard could ever give anyone.

Mr. Noel Baker: Well, I do not think it is competition in respect of making armaments in any way.

1483. *Professor Gutteridge*: It depends on how you define "armaments," of course.

Mr. Noel Baker: Yes.

1484. *Professor Gutteridge*: I am not saying that. What I do say is this: It is conceivable that a British firm which is building ocean-going liners is in competition with foreign firms, and therefore getting to know all that is latest in the way of oil-driven engines, and so on, and they would probably be a rather more valuable asset to the country for the purpose of armaments than a person building warships.

Mr. Noel Baker: If I may suggest it, it would be perfectly possible for the government dockyards and for the Admiralty to keep in touch with the private firms and get any such information as they can get from competition.

1485. *Professor Gutteridge*: That would depend on the willingness of the private firms to volunteer the information.

Mr. Noel Baker: I should have thought that, as a matter of patriotic duty, they would be willing to do so. I do not think there is any ground for thinking that the manufacturers either of arms or anything else are not patriotic in that sense. I should have thought they would be more willing, since they will not be communicating it to any competitor who is making something that they are making themselves—only to the government, who would not enter into competition with the firms.

1486. *Chairman*: There are two more questions which I should like to ask you. You would agree, would you not, that from our point of view we have not got to consider the immediate future, but we have got to look ahead. Take this position: Supposing a period of 20 years' peace from now, and then an outbreak of war; one would have to contrast the position on the expiration of those 20 years of peace as between a government monopoly existing during those 20 years and government arsenals plus private firms allowed controlled export? That is the sort of matter that one has to consider. You would agree to that, would you not?

Mr. Noel Baker: Yes, certainly. I think, if I may say so, the Commission has to consider perhaps the immediate future, but quite certainly the further future. Whichever hypothesis is taken, my memorandum is designed to persuade you that

it is to our advantage definitely, on balance of considerations, that in any circumstances it is better to abolish.

1487. *Chairman*: One other question. I am not quite sure that I understood what you said to us in your address when you referred to so many extracts from the trade Press; because, given a trade of sufficient importance to warrant a trade Press, that trade Press exists for the purpose of commending the trade to all and sundry?

Mr. Noel Baker: Yes.

1488. *Chairman*: Supposing they act *bona fide*, I do not quite follow what conclusion you wanted us to draw from that. Of course, the condemnation of the trade in a sense was a condemnation of any policy that affected the trade materially or injuriously. I do not quite follow the inference you wanted us to draw; I am sorry.

Mr. Noel Baker: If I may explain it briefly, it was this: I think that, as you say, obviously this trade Press depends upon the industry which makes military aircraft.

1489. *Chairman*: That is the same with all trade journals, is it not?

Mr. Noel Baker: Yes; but in this particular case it has the unfortunate result that these journals are read by everyone who is interested in aviation.

1490. *Chairman*: That is the same with all trade journals, temperance or any other?

Mr. Noel Baker: Yes. I have called them the organised air interests, and I have said that the effect of their writing over a long period of years has been to convince the vast majority of those who are interested in aviation that disarmament and international solutions of the air problem are nonsense, impracticable, and wrong, and even unpatriotic.

1491. *Chairman*: It is going a long way. With regard to the very intelligent people you say have been influenced, why should they take all these statements for gospel? I do not quite follow.

Mr. Noel Baker: I think that in fact they do.

1492. *Chairman*: They may agree with them, by thinking it out independently for themselves. It seems to me you are attaching too much importance and assuming that everyone who reads a newspaper believes everything he sees in it. I protest against that.

Mr. Noel Baker: I do not want to over-stress it, but I do want to suggest that the air-minded are rather a special case; aviators are passionately absorbed in aviation, and very often, one might almost say, they do not think of much outside it; and therefore I do think that the specialised aviation journals and the specialised aviation societies and organisations do have much more influence on their minds, particularly on these big questions of the future of aviation, than, for example, the Grocers' Journal would have upon the mind of the average grocer. That is the whole point that I wanted to put, though I do not underestimate by any manner of means the influence of the Grocers' Journal on the mind of the grocer. I think it is very great.

1493. *Chairman*: I understand now. I am sure we are all very much obliged to you for giving us your evidence.

Mr. Noel Baker: I am very much obliged to the Commission.

(Adjourned.)

STATEMENT OF EVIDENCE SUBMITTED BY MR. P. J. NOEL BAKER, M.A

TABLE OF CONTENTS

	PAGE
Chapter I.—INTRODUCTORY	258
Chapter II.—THE GENERAL NATURE OF THE "EVIL EFFECTS" OF PRIVATE MANUFACTURE	258
Chapter III.—GOVERNMENT RESPONSIBILITY FOR THE SYSTEM OF PRIVATE MANUFACTURE	259
Chapter IV.—RECENT EXAMPLES OF THE INFLUENCE OF THE VESTED ARMAMENT INTEREST	260
Chapter V.—THE BASIC PRINCIPLES OF ARMAMENT POLICY: INTERNATIONAL ANARCHY AND ORGANISED DISARMAMENT AND PEACE	264
Chapter VI.—HOW TO DEAL WITH THE "EVIL EFFECTS" OF PRIVATE MANUFACTURE: ABOLITION OR CONTROL?	265
Advantages of State Monopoly under a Disarmament Treaty	
Conclusions	
Chapter VII.—THE ALLEGED ADVANTAGES OF A SYSTEM OF PRIVATE MANUFACTURE	267
Chapter VIII.—THE GENERAL NATURE OF THE ALLEGED ADVANTAGES OF THE SYSTEM OF PRIVATE MANUFACTURE	268
Competition and the stimulus of private gain	
Conclusions	
Chapter IX.—WOULD THE SYSTEM OF GOVERNMENT MONOPOLY INCREASE NATIONAL TAXATION?	270
Comparative Real Costs of Government and Private Manufacture of Arms... ..	
Comparative Prices of Government made and Privately made Armaments	
The Evidence of Actual Experience	
Experience in the United States of America	
British Experience	
French Experience	
Experience in Time of War	
Would New Arsenals be Required?	
The Increase of Reserve Armament Plant	
Conclusion	
Chapter X.—THE ALLEGED ADVANTAGE OF PRIVATE MANUFACTURE IN PROMOTING PROGRESS IN DESIGN OF ARMAMENTS	274
How the stimulus of Private Profit is alleged to work	
Do the interests of the Private Manufacturers and the interest of the Nation in this matter coincide?	
Under conditions of international anarchy and armament competition	
In Time of War... ..	
Under a System of organised international disarmament and peace	
Conclusions	
Have Private Firms a Better Record than Government Departments in respect of Progress in Design?	
How Progress in Design is effected	
Conclusions	
War Experience in respect of the matter of Progress in Design... ..	
The Value of Secrecy in Progress in Design	
Conclusions	
Chapter XI.—THE ALLEGED ADVANTAGES OF FOREIGN TRADE IN ARMS	279
The value of Great Britain's exports of arms... ..	
The alleged advantages of arms exports	
The employment given by the export trade in arms	
The "spreading" of "overhead charges"	
The alleged increase of reserve capacity for armament expansion in time of war	
The requisition of war material on order for foreign Powers when war breaks out	
Conclusions	
Chapter XII.—PRIVATE MANUFACTURE AND THE EXPANSION OF ARMAMENT PRODUCTION IN TIME OF WAR	282
Comparative Expansion of Government Factories and Private Armament Firms	
Bringing non-specialised industry into armament production	
The causes of the failure of the private firms	
Their internal organisation	
The sub-contracting system	
Labour	
Raw Materials	
Machine Tools	
Sub-division of industrial processes	
Co-ordination of Production	
Instruction of non-specialised engineering firms	
The Construction of new Factories	
Conclusions	
The Evidence of Authority... ..	

	PAGE
Chapter XIII.—THE ALLEGED DIFFICULTIES OF DEFINING ARMAMENTS	290
The Definition of Armaments	
The Value of the Definition of Armaments	
The Purpose for which Abolition is Proposed	
Would the Proposed Solution Suffice for International Agreement to Abolish Private Manufacture?
